[1] Excluding Government stocks.
[2] Data not available.
[3] Includes only that part of castings made by companies that also produce steel ingots.
[4] Excludes companies that produce both steel castings and steel ingots.
[5] The greater part of the consumption of ore was used in the manufacture of ferromanganese and silicomanganese. Combining consumption of ore with that of ferromanganese and silicomanganese would result in duplication.
[6] Excludes small tonnages of producers' stocks.

The consumption of manganese per short ton of steel manufactured in 1949 was 13.2 pounds, as in 1947. In 1948 the ratio was 12.7 pounds per ton of steel. The variation is considerable because of the large tonnages involved and is explained by the use of manganese as an alloying element in addition to its primary use as a sulfur counteractant. Manganese alloy steels range up to 14 percent Mn, and relatively small tonnages of these alloys will affect the ratio materially. Of the 13.2 pounds used per ton of steel, 11.8 pounds was in the form of ferromanganese, 1.0 pound as silicomanganese, 0.3 pound as spiegeleisen, and 0.1 pound as ore. These data apply to consumption of manganese in the manufacture of steel ingots and that part of steel castings manufactured by companies that also produce steel ingots. The companies reporting in this part of the survey are the same as those reporting production of ingots and castings to the American Iron and Steel Institute.

Electrolytic Manganese.—The Electro Manganese Corp., Knoxville, Tenn., was the only producer of electrolytic manganese during 1949.

Ferromanganese and spiegeleisen imported into and made from domestic and imported ores in the United States, 1948–49, in short tons

	1948		1949

[1] None produced from foreign ore in 1948–49.

Ferromanganese.—Output of ferromanganese in the United States was off 11 percent to 577,345 short tons in 1949 compared with 647,617 tons in 1948. The following plants were active producers during the year: Bethlehem Steel Co., Johnstown, Pa.; Anaconda Copper Mining Co., Black Eagle, Mont.; the Electro Metallurgical Division of the Union Carbide & Carbon Corp., Ashtabula, Ohio, and Alloy, W. Va.;

E. J. Lavino & Co., Reusens, Va., and Sheridan, Pa.; Sloss-Sheffield Steel & Iron Co., North Birmingham, Ala.; and Carnegie-Illinois Steel Corp., Clairton and Etna, Pa. Manganese ore consumed in the manufacture of ferromanganese totaled 1,169,369 short tons in 1949. Of this quantity, 10 percent was of domestic origin and 90 percent foreign. The domestic contribution in 1948 was six percent and in 1947, nine. The recovery of manganese from ore in making ferromanganese was 83.3 percent in 1949 compared with 84.6 percent in 1948 and 84.8 percent in 1947. Shipments of ferromanganese from producing furnaces in 1949 fell 15 percent in quantity and 4 percent in value from 1948. The following table gives shipments and values for the past 5 years.

Ferromanganese produced in the United States and metalliferous materials consumed in its manufacture, 1945–49

Year	Ferromanganese produced			Materials consumed (short tons)			Manganese ore used per ton of ferromanganese made (short tons)
	Short tons	Manganese contained		Manganese ore (35 percent or more Mn, natural)		Iron and manganiferous iron ores	
		Percent	Short tons	Foreign	Domestic

Ferromanganese shipped from furnaces in the United States, 1945–49

Year	Short tons	Value	Year	Short tons	Value
1945	610,376	$78,907,189	1948	659,193	$90,126,657
1946	493,808	61,355,778	1949	560,180	86,463,708
1947	614,647	79,972,673			

Spiegeleisen.—Production of spiegeleisen in the United States dropped sharply in 1949 to 78,167 short tons from 112,610 tons in 1948, a decrease of 31 percent. Shipments fell 51 percent in quantity, while value decreased 44 percent. The continued downward trend in the use of spiegeleisen is not encouraging when it is noted that ferromanganese is being substituted for this material. The strategic aspects of the high-grade alloy should discourage its use where unnecessary; however, the inconvenience of handling spiegeleisen compared with ferromanganese, the lesser degree of control possible, and the lack of sufficient price differential tend to push this material into the background.

Three companies produced spiegeleisen in four plants in 1949: New Jersey Zinc Co., Palmerton, Pa.; Inland Steel Co., East Chicago, Ind.; and Carnegie-Illinois Steel Corp., Etna, Pa., and Gary, Ind. No foreign materials were reported used in the manufacture of spiegeleisen in 1949.

Spiegeleisen produced and shipped in the United States, 1945–49

Year	Produced (short tons)	Shipped from furnaces		Year	Produced (short tons)	Shipped from furnaces	
		Short tons	Value			Short tons	Value
1945	139,039	157,774	$5,108,144	1948	112,610	108,960	$5,281,650
1946	111,696	114,982	3,793,673	1949	78,167	53,888	2,972,653
1947	134,329	124,517	4,980,030				

Manganiferous Pig Iron.—Pig-iron blast furnaces used 1,045,527 tons of manganese-bearing ores containing (natural) over 5 percent Mn in 1949. Of the ore used, 933,906 tons were of domestic and 111,621 tons of foreign origin. Of the domestic material used, 868,082 tons contained (natural) 5 to 10 percent Mn, 65,614 tons 10 to 35 percent Mn, and 210 tons contained more than 35 percent Mn. Of the foreign material used, 67,466 tons contained less than 10 percent Mn, 4,679 tons contained 10 to 35 percent Mn, and 39,476 tons contained more than 35 percent Mn.

Battery and Miscellaneous Industries.—Manufacturers of dry cells used 34,469 short tons of manganese ore during 1949; of this total, 3,747 tons were of domestic and 30,722 tons of foreign origin. Chemical plants used 16,441 tons, of which 5,373 tons were domestic and 11,068 tons were imported. All of the ore used contained (natural) more than 35 percent Mn. The principal use of chemical ore is in the manufacture of manganese sulfate fertilizer and of hydroquinone for photographic use. Manganese ore for battery use should have a high content of available oxygen with minimum iron and be relatively free from such metals as arsenic, nickel, copper, and cobalt, which are electronegative to zinc. Preferably, battery manganese ore should be poorly crystallized and consist of the gamma oxide known as cryptomelane.

Foreign ferruginous manganese ore and manganiferous iron ore consumed in the United States, 1946–49, in short tons

PRICES

Manganese Ore.—Prices of manganese ore containing 48 percent Mn, as quoted by E&MJ Metal and Mineral Markets, at the beginning of 1949 ranged from 70.6 to 72.6 cents per long-ton unit, including duty f. o. b. eastern and southern ports. At the end of the year comparable prices ranged from 81.8 to 83.8 cents per unit. The long-ton unit upon which the price of manganese ore is based is 1 percent of a long ton (22.4 pounds) of contained manganese. Prices of chemical ore are given on a per-ton basis, with a minimum requirement of manganese dioxide. A duty of one-fourth cent per pound of contained manganese was imposed on all ores imported in 1949, except those from Cuba and the Republic of the Philippines, which entered duty free.

Manganese Alloys.—The average value, f. o. b. producers' furnaces, for ferromanganese shipped during 1949 was $154.35 per short ton, compared with $136.72 in 1948. According to Iron Age, the selling price of ferromanganese in carlots at eastern centers rose from $162 per gross ton, which had been in effect since October 1948, to $173.40 in December 1949; the average for the year was $171.08. The value of spiegeleisen, f. o. b. domestic furnaces, was $55.16 per short ton compared with $48.29 in 1948; and the quoted price, as given by Iron Age, rose from $62.00 per gross ton at the beginning of the year to $63.20 in March and to $65 in April, then remained unchanged during the balance of the year. The average quoted price per gross ton was $64.35 in 1949.

FOREIGN TRADE [1]

Imports of all grades of manganese are shown by countries in the accompanying table. The data include imports of battery-grade ore totaling 77,284 short tons in 1949. Of this quantity, 55,832 tons came from Gold Coast, 11,025 tons from U. S. S. R., 5,055 tons from Cuba, 3,541 tons from India, 1,098 tons from French Morocco, 471 tons from Mexico, 200 tons from France, 56 tons from the United Kingdom, and 6 tons from Spanish Africa. This ore averaged 53.73 percent Mn or 85 percent MnO_2. Imports for consumption of battery ore totaled 73,123 short tons valued at $1,966,039 or $26.89 per short ton f. o. b. foreign ports. Of the total, Gold Coast supplied

WORLD REVIEW

The accompanying table shows, insofar as statistics are available, the world production of manganese ores from 1943 to 1949 and their average manganese content. Official statistics of the countries are used, supplemented by data from semiofficial and other sources.

World production of manganese ore, by countries, 1943–49, in metric tons

[1] In addition to countries listed, Belgium, Bulgaria, Costa Rica, Eritrea, Iran, Spanish Morocco, and Yugoslavia have produced manganese ore; but data of output are not available, and no estimates for them are included in the totals. Czechoslovakia and Northern Rhodesia report production of manganese ore, but as it has been ascertained that the product so reported averages less than 30 percent Mn and therefore would be considered ferruginous manganese ore under the classification used in this report, the output has not been included in the table.

[14] Fiscal year ended March 31 of year following that stated.

[15] January to May, inclusive.

Australia.—Consumption of manganese ore in Australia greatly exceeds its small production. In past years the Commonwealth has received most of its imports from India. In 1949, however, some 10,000 tons of ore were reported received from Russia, enough to supply Australia's needs for more than a year. This delivery was made to the Broken Hill Co. Pty., Ltd.[2] Domestic production in Australia comes largely from the Horseshoe deposits, 419 miles from Geraldton, although Broken Hill contracted for 2,000 tons of Queensland ore from Imbil, about 40 miles south of Maryborough.[3]

Belgian Congo.—Production continued at the Kasokelesa mines in Katanga in 1949. A deposit in the upper Lulua River Valley, believed to contain large reserves of high-grade metallurgical ore, was prospected during the year. The exploitation of these reserves would require extensive development and construction of a railroad to the area.

Brazil.—Production of manganese ore in Brazil was restricted largely to the Morro de Mina deposit in Minas Gerais, with some small production in Bahia. There are, however, two large potential locations in remote areas of Brazil which promise large production in the future. The first of these is the Urucum deposit in the State of Mato Grosso near the Bolivian border. This deposit contains over 33,000,000 gross tons averaging 45.6 percent Mn and 11.1 percent Fe. A disadvantage of this area, however, is its location, causing serious transportation problems. Some ore from this area could be transported by rail about 700 miles to Santos for reshipment. However, most of the material would be barged down the Paraguay River approximately 1,700 miles to the Plata Estuary for transfer to ocean vessels.[4] This deposit is currently under development by the United States Steel Corp.

The second large potential manganese-producing area in Brazil is the Serra do Navio district in the Territory of Amapa in northern Brazil. These deposits are on the banks of the Amapari River about 240 kilometers from Macapa on the Amazon River. The reserves have been estimated by Dorr and others[5] at 7,385,000 metric tons averaging 48.36 percent Mn and 5.96 percent Fe. Later development work indicates that the reserves may greatly exceed the above estimate. This area is under development by the Bethlehem Steel Co., and again a serious transportation problem is involved; a railroad must be constructed from the deposit to Macapa, or facilities must be installed for barging down the Amapari to Porte Grande and then transshipment to Macapa by rail or truck. Deep water is available at Macapa.

Chile.—Chilean manganese production is now small but could be increased to several times its present rate by accumulating and blending ores from many small deposits having a wide range in analysis.

Gold Coast.—All the production of manganese ore from Gold Coast comes from the Nsuta mine. Operations were at capacity of 60,000

tons per month throughout 1949. Ores from the mine are high-grade, being used for metallurgical, battery, and chemical purposes. Fine ore is sintered in a Dwight-Lloyd plant. Other manganese deposits in Gold Coast are of uncertain grade and tonnage.

India.—Production and exports of manganese ore from India have risen sharply since the early postwar years. This has been possible through improvement in the railroad transportation in India brought about by the addition of new rolling stock but, more important, by improved administration of existing facilities. A board of 12 members has successfully programed a more efficient use of the entire Indian rail system. Manganese-ore exports are licensed by the Indian Government, and most of the 1949 quota of 400,000 gross tons for export to the United States was attained. Moreover, it appeared at the end of 1949 that the new 500,000-ton quota for 1950 also had a reasonable chance of being filled. The United States and the United Kingdom received most of India's exports, but Belgium, Italy, France, Japan, and Germany also received substantial tonnages. Central Provinces contain the most important reserves of high-grade manganese ore in India, amounting to many millions of tons. New deposits in Kutingi and near Ambodala were described by Corry.[6] It was stated that an annual output of 50,000 tons should be possible from Kutingi and 20,000 to 30,000 tons per year from the Ambodala deposit; both are near the Bengal-Nagpur Railway. Most of the manganese exports from India are loaded in the port of Vizagapatam, which can handle 50,000 tons per month.

Mexico.—Mexican exports of manganese ore in 1948, most of which came from the Lucifer mine in Lower California, totaled 57,464 metric tons compared with 42,048 tons in 1947; all went to the United States.[7]

U. S. S. R.—The Soviet Union is probably the world's largest producer of manganese despite its present policy of exporting relatively very small tonnages. The deposits in Russia occur in two main areas, Nikopol and the Caucasus; normally the latter area provides the export material, and Nikopol mainly the ore for domestic consumption. The U. S. S. R. is the only large steel-producing nation of the world that is self-sufficient in manganese, and, due to its favorable position with respect to large reserves, it uses proportionately more manganese than any other large industrial nation. It is known that Russia uses manganese for alloying purposes to a far greater extent than does the United States; and, based on known steel analyses of Russian production, it is probable that the total consumption in Russia approximates 1,000,000 tons per year, or two-thirds that of the United States, whereas its steel capacity is less than one-third. Inasmuch as Russian exports are low, it is not unlikely that manganese ore from the Caucasus is being stock-piled at steel centers east of the Ural Mountains. The offering of Russian ferromanganese on the European market has been reported.

Mercury

By Helena M. Meyer and Alethea W. Mitchell

GENERAL SUMMARY

CONSUMPTION of mercury in 1949, although 14 percent less than in 1948, was at a peacetime record rate except for that year. This favorable factor, however, was not enough to bring prosperity to the domestic mercury-mining industry; prices trended downward from the beginning to the end of the year, and domestic production dropped 31 percent to the lowest level since 1933. Imports of mercury for consumption were unprecedented, being over three times as large as in 1948 and 50 percent above the previous record in 1945. A very large part of the imported metal was destined for the National Stock Pile, but before such disposition this metal overhung and depressed the market; unabsorbed large stocks abroad and world production capacity greatly exceeding present world needs were added depressants.

The high rate of mercury consumption in 1949 is explained in part by new mercury-boiler installations, whereas the record peacetime use in 1948 was accounted for in part by new chlorine and caustic soda constructions. The mercury in such plants is not "consumed" in a strict sense, because it can be reclaimed and reused if the plant is dismantled. Other than the new boiler plants, which required less new metal than the chlorine and caustic soda installations in 1948, noteworthy consumption gains were made only for electrical purposes (including the new cell) and for antifouling paint.

In the first half of 1949 production was at an annual rate lower than at any time since 1850, when production records began. The reopening of the Cordero mine, Humboldt County, Nev., and its substantial output in the latter part of the year raised the domestic total well above expectations for the year. This property and the Mount Jackson mine, Sonoma County, Calif., were the only large properties in production at the year end. The Bonanza mine, Douglas County, Oreg., second-largest in the early months of 1949, closed November 30, and the closure was said to be permanent. The Cordero mine closed February 15, 1950, only two watchmen remaining at the property.

Of the record receipts of metal in 1949, 94 percent was from Europe; Italy supplied 82 percent, Spain 9 percent, and Yugoslavia 3 percent. Most of the material entered, as already stated, was for the Government stock pile; it was metal acquired in Italy by the Economic Cooperation Administration with counterpart funds[1] accumulated there and earmarked for the purchase of strategic materials. United States exports of mercury were small, as usual, amounting to less than 1 percent of imports.

[1] Recipients of goods and services from ECA grants pay for them in local currency into their respective Government's counterpart fund. The fund is used by each Government to improve its country's economy, except that 5 percent is allocated to the United States.

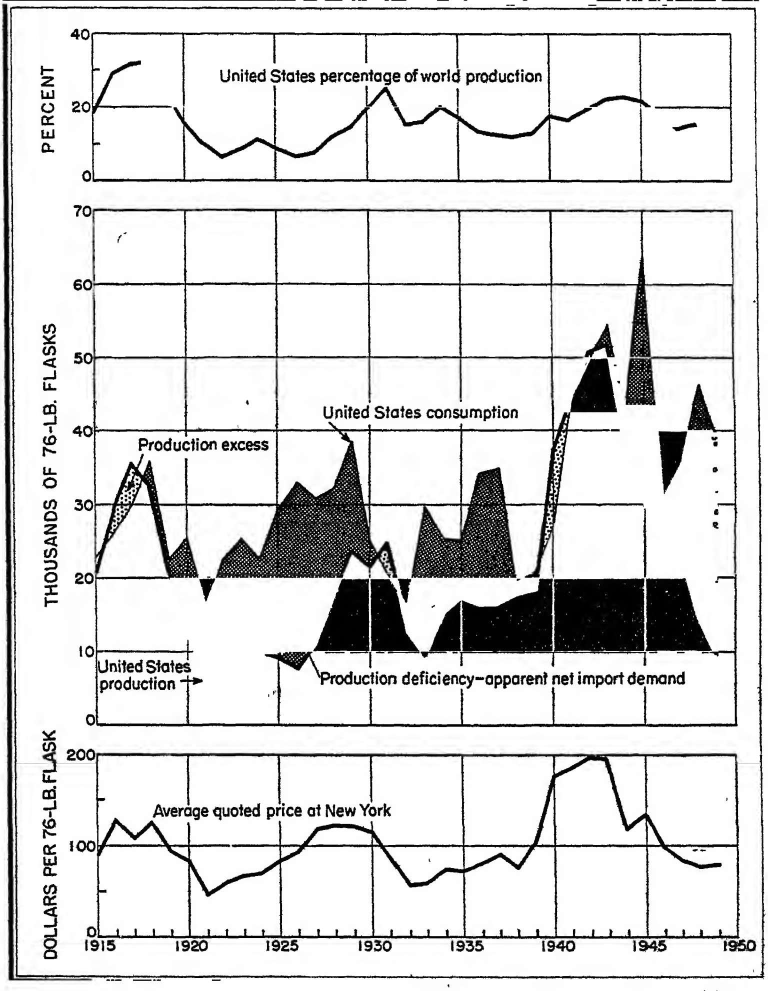

FIGURE 1.—Trends in production, consumption, and price of mercury, 1915–49.

Salient statistics of the mercury industry in the United States, 1940–44 (average) and 1945–49

[Flasks of 76 pounds]

	1940–44 (average)	1945	1946	1947	1948	1949
Production	44,632	30,763	25,348	23,244	14,388	9,930
Number of producing mines	158	68	51	37	20	23
Average price per flask: New York	$174.36	$134.89	$98.24	$83.74	$76.49	$79.46
Imports for consumption	22,842	68,617	13,894	13,008	31,951	103,141
Exports	2,737	1,038	907	884	[1] 526	577
Consumption	43,740	62,429	31,552	35,581	46,253	39,857

[1] Revised figure.

The movement of prices reflected the depressed condition of the domestic industry. Late in December 1948 Mercurio Europeo, the Spanish-Italian cartel, marked up its price for mercury $14 a flask, reversing the downtrend generally in progress from March 1945. The downtrend was resumed almost immediately, the price falling from $89.60 a flask at New York in January to $71 in December. The average for 1949 ($79.46 a flask) was slightly above that for 1948 but otherwise was the lowest annual average since 1938. Since 1938 the Bureau of Labor Statistics index for all commodities, including many items affecting cost of producing mercury, has more than doubled, so that the 1949 price probably represents less than $40 in prewar purchasing power.

Mercurio Europeo was reported to have dissolved January 1, 1950, Italy's disproportionate shipments to the United States in 1949 being rumored as the cause.

The 1948 report of this series contains a historical table on domestic and world production, and United States imports, exports, consumption, and prices for 1910–48.

Strategic Minerals Investigations.—The Bureau of Mines was authorized by the Strategic Materials Act of 1939 to investigate deposits of seven strategic minerals, including mercury, with the objective of developing tonnages of low-grade material that could be mined in an emergency. The program was expanded during the war to include other minerals and the objective became the more immediate one of expanding production. A report [2] recently published described results of the program for 1939–49. For mercury it said:

> Most of the mercury projects undertaken indicated at least low-grade ore. The contained mercury is more than double that used during a year at the peak of wartime consumption. Eight of the deposits produced during the war. One of them was the second largest domestic producer for several years. At another project, the operator followed up the Bureau indications with additional development that showed 300,000 tons of 20-pound ore, which is in itself equivalent to more than the peak wartime year's consumption.
>
> The post-war decline in price has stopped most domestic production, but the unmined tonnages indicated by the Bureau's work would be available during another period of high prices such as might prevail during a war.

Tonnages of mercury ore from 332 examinations at 43 deposits were reported as follows:

> 370,000 tons of high-grade ore, averaging 16.2 pounds mercury per ton, developed.
>
> 1,220,000 tons of low-grade, averaging 2.5 pounds mercury per ton, developed.
>
> 285,000 tons of 1.6-pound material indicated by dump sampling.

The Bureau of Mines recently published a report [3] on concentration tests on mercury ores. Ores tested included three from Jackson County, Oreg., and one each from Valley County, Idaho; Storey County, Nev.; and Sonoma County, Calif. In summarizing, the report stated:

> In general, the ores from Oregon were not amenable to concentration by flotation because of intimate association of cinnabar with other minerals or because of extremely low grade. One Oregon ore was amenable to direct distillation provided lime was added to reduce corrosion of the retort.
>
> The sample from Idaho was composed of a sticky gouge material that had never been treated effectively. Laboratory tests showed that the ore could be dis-

[3] Wells, R. R., Laboratory Concentration of Mercury Ores from Oregon, California, Idaho, and Nevada: Bureau of Mines Rept. of Investigations 4620, 1950, 19 pp.

integrated, deslimed, and the sand fractions treated by direct furnacing. The ore also proved to be amenable to flotation.

The low-grade ore from Nevada was readily concentrated by flotation or combined tabling and flotation.

The California ore could be partly concentrated by sizing and was fairly amenable to concentration by flotation.

DOMESTIC PRODUCTION

During most of 1949 only two important mercury-producing mines were in operation. At the beginning of the year they were the Mount Jackson (including Great Eastern), Sonoma County, Calif., and the Bonanza, Douglas County, Oreg., and at the end of the year they were the former and the Cordero mine, Humboldt County, Nev. The idle Cordero mine was reopened and produced in the latter part of the year; but the Bonanza closed November 30, and the closure was said to be permanent. The maintenance of a nucleus of a domestic mining industry has been surprising in view of reported domestic mining costs of production and repeated threats, over many months, of an impending complete shut-down of domestic mines. There seems to be little doubt that a part, perhaps substantial, of domestic production in 1949 was uneconomic. The evidence is that output in 1950 will continue the decline in progress since 1943.

A total of 9,930 flasks of mercury was produced in 1949, 31 percent below 1948 and the smallest annual total since 1933. In only 7 years in the past 100 has production been smaller than in 1949. In the early months of 1949 output was at an annual rate lower than at any other time since production records began in 1850.

Mines that produced over 50 flasks each were as follows:

Alaska—Decoursey Mountain mine.

California—San Benito County, Juniper, New Idria, and North Star mines; Sonoma County, Mount Jackson (including Great Eastern) mine.

Nevada—Humboldt County, Cordero mine.

Oregon—Douglas County, Bonanza mine.

These 7 mines accounted for 98 percent of the United States total in 1949; in 1948, 10 mines produced 98 percent but in 1942 it took 34 mines to furnish 89 percent.

Mercury produced in the United States, 1946–49, by States

Year and State	Producing mines	Flasks of 76 pounds	Value[1]	Year and State	Producing mines	Flasks of 76 pounds	Value[1]

For many years the trend in grade of mercury ore treated in the United States was downward. This trend was reversed notably in 1944, and since then the average has been higher than for many prior years. In 1949 the average differed little from that in 1948 but was 15 percent or more below the best recent years, 1946 and 1947.

Mercury ore treated and mercury produced therefrom in the United States, 1927–49 [1]

[That material from old dumps which is not separable is included with ore]

Year	Ore treated (short tons)	Mercury produced: Flasks of 76 pounds	Mercury produced: Pounds per ton of ore	Year	Ore treated (short tons)	Mercury produced: Flasks of 76 pounds	Mercury produced: Pounds per ton of ore

[1] Excludes mercury produced from placer operations and from clean-up activity at furnaces and other plants.

In addition to the mercury produced at the mines in 1949, at least 1,385 flasks were reported as produced from battery plates, scrap, and calomel, compared with 2,170 flasks in 1948. Additional unreported quantities doubtless were recovered.

REVIEW BY STATES

Alaska.—Underground activity at the Decoursey Mountain mine was stopped in August 1948, but placer operations yielded some mercury in 1949. The property is equipped with a jaw crusher and two D retorts.

California.—Fifteen mines produced some mercury in California in 1949, and one of the three leading producers in the United States—

the Mount Jackson (including Great Eastern)—is located in the State, in Sonoma County. For the first time in many years California's output was less than half of the United States total; output in 1949 was 45 percent contrasted with 78 and 74 percent in 1948 and 1947, respectively. Counties other than Sonoma that yielded some mercury in 1949 were Fresno, Napa, San Benito, San Luis Obispo, and Santa Clara.

A Gould rotary furnace was installed at the Archer mine, Fresno County, and after being operated experimentally for 2 weeks was closed on December 5. In all, 300 tons of ore was processed to recover 7 flasks of mercury. The mine was closed because the market did not permit economic production.

Bureau of Mines work at the Abbott mine, Lake County, was described [4] in a report published recently. According to the report, the mine was discovered in 1862 and since first production in 1870 to 1946, inclusive, produced about 37,480 flasks, of which 30,880 were recovered through 1940 and 6,600 from 1941 to 1946, inclusive. The mine has not produced since August 1946.

A few flasks of mercury were produced from Oat Hill dumps in Napa County in 1949. A Bureau of Mines report on the Oat Hill mine was issued in October.[5] The mine was discovered in 1872. Total production from 1876 to 1944, inclusive, was said to have exceeded 164,000 flasks. There has been no production since 1945.

Berg and Sciochetti produced mercury in retorts at the Juniper mine, San Benito County. The New Idria mine, which when active is usually the largest producer in the United States, was not operated in 1949, except for making occasional runs on ore removed in maintenance and retimbering work. Ore taken from the North Star mine by Leonard W. Knepper was furnaced at New Idria. R. Diaz produced a small quantity of mercury in a retort at the Aurora mine. The rotary furnace at the property was inactive.

The property of the New Idria Quicksilver Mining Co. property at Idria, Calif., was explored for additional ore bodies by the Bureau of Mines in cooperation with the Geological Survey, and a report on the results was released in August.[6] According to the report, the New Idria operation produced 460,820 flasks of mercury from 1858 to 1947—378,459 through 1935 and 82,361 thereafter.

Raymond Dodd produced a little mercury in a retort from clean-up operations around an old furnace at the Klau mine, San Luis Obispo County.

Kirk & Stotesberry mined 35 tons of ore by open-cutting a reportedly new outcrop at the Almaden mine, Santa Clara County. Satisfactory operation of a "new-type" retort, in which 29 flasks of metal were recovered, was reported. Plant clean-up operations at the Guadalupe mine yielded a little mercury. Activity on Almaden dumps again resulted in some production.

The Mount Jackson (including Great Eastern) mine was one of the two largest mercury-producing mines in the United States in 1949. Of the three leading mines, this was the only one to operate continuously. Ore is treated in a Gould rotary furnace.

C. A. Baumeister & Son produced 13 flasks from furnacing 70 tons of ore at the Culver-Baer mine and Frank A. Dewey 20 flasks from furnacing 120 tons at the Dewey-Geyser mine.

Nevada.—Virtually all of the mercury output in Nevada in 1949 was from the Cordero mine, Humboldt County, which was productive in the latter part of the year only, but which ranked as the leading producer in the United States nonetheless. Other than Cordero, the only properties for which production was reported were the Red Rock mine, Esmeralda County; a mine at Ione, Nye County; and the Red Bird mine and another property, Pershing County. Ore is treated at Cordero in an 80-ton Nichols-Herreshoff furnace.

Oregon.—Only two properties reported production in 1949, by far the more important of which was the Bonanza mine, Douglas County. This mine was the third-largest mercury producer in the United States in 1949 and had been the leading producer in Oregon for 12 years. The company reported that mine and plant (Gould rotary) were closed November 30, and the shut-down was said to be permanent.

CONSUMPTION AND USES

The installation of three new mercury-boiler plants featured consumption of mercury in 1949. The disappearance of mercury from stocks for plants such as these is not actually consumption, because the metal can be almost entirely reclaimed and reused if the plant is dismantled. The Bureau of Mines excludes as consumption reuse of such metal. One of the new plants that went into operation in 1949—the Pittsfield, Mass., plant, for example—used mercury released by the closing of a larger unit at Schenectady, N. Y. The mercury used at Pittsfield is therefore not included in the consumption figures given here. The other new boiler installations were a replacement plant at Hartford, Conn., representing consumption only insofar as new metal was used to supplement mercury from the old, smaller unit, and a new plant at Portsmouth, N. H. Boiler plants did not take as much new mercury in 1949 as the new chlorine and caustic soda installations did in 1948.

Consumption of mercury in the manufacture of antifouling paint made the most noteworthy gain in 1949, rising 69 percent over 1948, and electrical apparatus (including the new cell) increased 13 percent. After 2 years in which the use of mercury for agricultural products considerably more than doubled, consumption for this purpose dropped 34 percent in 1949. Industrial and control instruments declined 11 percent. Manufacture of fulminate took only 34 percent as much as in 1948.

Mercury consumed in the United States, 1948–49, in flasks of 76 pounds

Use	1948	1949	Use	1948	1949
Pharmaceuticals	3,382	3,443	Electrical apparatus	[1] 6,471	[1] 7,323
Dental preparations	[1] 994	[1] 963	Industrial and control instruments	[1] 5,653	[1] 5,916
Fulminate for munitions and blasting caps	441	149	Amalgamation	143	165
Agriculture	7,048	4,667	General laboratory	442	345
Antifouling paint	996	1,683	Redistilled	[1] 6,499	[1] 6,642
Electrolytic preparation of chlorine and caustic soda	806	755	Other	10,116	6,186
Catalysts	3,262	2,520	Total	46,253	39,857

[1] A partial break-down of the "redistilled" classification showed 53 percent was for instruments, 16 percent for dental preparations, and 16 percent for electrical apparatus in 1948 and 51, 15, and 17 percent, respectively, in 1949.

Mercury consumed in the United States, 1942–45, by months, and 1946–49, by quarters, in flasks of 76 pounds

Final				62,429	31,552	35,581	46,253	39,857

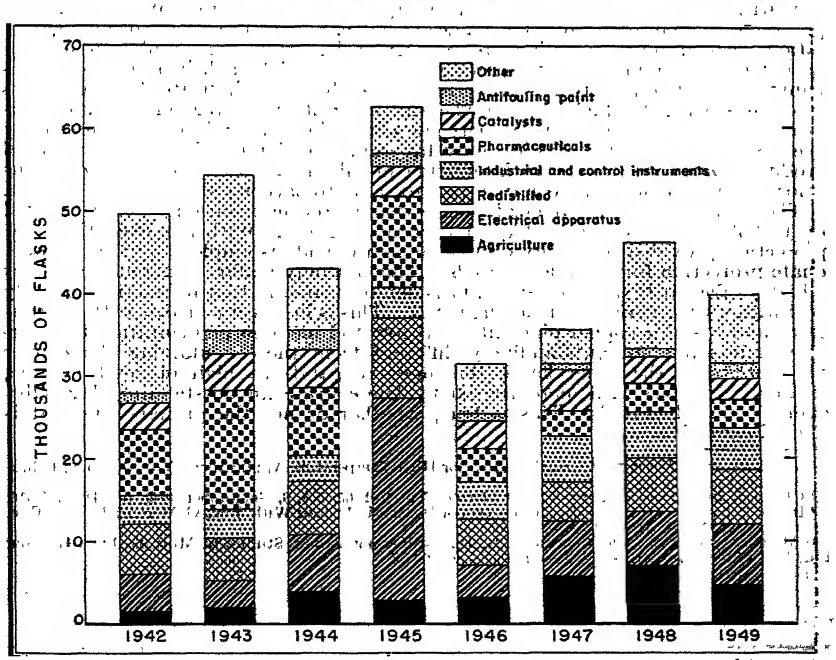

FIGURE 2.—Trends in consumption of mercury by uses, 1942–49.

A new mercury thermal system, claimed to provide simple, dependable, and less expensive means of measurement and control of temperatures above 1,000°, was recently announced.[7]

The De Nora cell for production of caustic soda and chlorine is now licensed by the Monsanto Chemical Co. The cell, developed by the firm of Dott. Ing. Oronzio De Nora, Impianti Electtrochimici, Milan, Italy, was recently described.[8]

Phenyl mercurial compounds for use as fungicides and bactericides in the preservation of textiles were recently discussed.[9] An abstract of the article follows:

> Phenyl mercurials exert strong bactericidal and fungicidal influence even at very low concentrations. Their general use in industry has been retarded by their low solubility and the consequent difficulty of obtaining even applications of sufficient strength on fabrics, and also by the risk of dermatitis involved in handling. These difficulties have been overcome by the production of a phenyl mercuric salt of 2,2′-dinaphthyl merthane-3,3′-disulfonic acid. This salt goes readily into colloidal solution, and the colloid breaks irreversibly when dried on the fiber. Thus it is possible to treat cloth simply and to obtain a fast protection on this cloth. Qualitative and quantitative microbiological tests on cotton and wool are described for this salt (phenyl mercuric Fixtan) and for phenyl mercuric acetate.

In a recent study on antifouling paints, it was stated[10] that compounds of mercury have assumed a minor role in most antifouling paints used by the Navy. The article states:

> Their past history as successful toxics is well-known, and principally for economic reasons have they been forced to assume a secondary role. Mercuric oxide and mercurous chloride have proved to be the most versatile of the inorganic derivatives for adaptation to paint films. To understand more fully the extent to which these toxics may be diluted with inert pigments, the same dilutions already described for copper and cuprous oxide were prepared and exposed. * * *
>
> These data demonstrate the feasibility of utilizing inert pigments in conjunction with inorganic derivatives of mercury. Here again, zinc oxide displays a pronounced superiority over diatomaceous silica and bentonite at lower pigmentations in combination with mercurous chloride. However, similar differences do not hold so obviously for mercuric oxide with which each inert pigment contributes almost equally to general performance. The data indicate that mercurous chloride is a highly efficient toxic when included at higher pigment volume, performing well when diluted with inert pigment. At greater dilution its efficiency decreases, but it still remains in a most favorable position relative to the undiluted product. Zinc dust offers an interesting possibility as a diluent for mercurous chloride, with considerable advantage over diatomaceous silica and bentonite.
>
> The data * * * further indicate that mercuric oxide may be supplanted up to 66% by almost any of the inerts investigated. With few exceptions the protection provided by highly diluted mercuric oxide is ample to guarantee adequate protection for extended periods. This not only reaffirms mercuric oxide as a highly efficient toxic, but versatility is demonstrated in that it functions equally well with a wide variety of inert pigments. This is in direct contrast with cuprous oxide and metallic copper pigments. At low and medium pigmentation the mercury paints are not outstandingly different from those containing the copper pigments. On the other hand, the mercury paints at high pigment volume, particularly those with mercuric oxide, demonstrate an outstanding durability over prolonged periods. This is true, whether or not the primary pigment is diluted extensively.

STOCKS

Industry inventories dropped substantially in 1949. Stocks were above normal at the beginning of the year in preparation for the new boiler installations, discussed under Consumption and Uses. Completion of the boiler schedule brought about the stock decline noted. Data on mercury held in the National Stock Pile are confidential; consequently, such stocks are not represented in the accompanying table. The National Stock Pile rose sharply in 1949 owing to receipts of metal obtained through the Economic Cooperation Administration; those purchases were discussed in the General Summary of this chapter.

Stocks of mercury in hands of producers, consumers and dealers, and Office of Metals Reserve, 1945–49, in flasks of 76 pounds

End of year	Producers [1]	Consumers and dealers	Office of Metals Reserve	Total
1945	3,243	17,000	63,638	83,900
1946	2,599	16,400	20,884	39,900
1947	3,084	16,200		19,284
1948	5,165	25,000		30,165
1949	5,354	15,600		20,954

[1] Operators that account for roughly 95 percent of output.

PRICES

The price for mercury generally was downtrending from May 1945 until a gradual strengthening took place in the latter part of 1948 culminating in the rise of $14 in the cartel (Mercurio Europeo) price late in December. The downtrend was resumed almost immediately after the price mark-up and continued to fall virtually without interruption to the end of the year. Quotations ranged from $90 to $93 a flask early in January to $71 to $73 a flask throughout December. The average for all of 1949 was 4 percent above 1948 and was close to the annual average for 1935–38. The Bureau of Labor Statistics index for wholesale prices had more than doubled in the interim, however, so that the 1949 price represented probably less than $40 in prewar purchasing power.

Average monthly prices per flask (76 pounds) of mercury at New York and London, and excess of New York price over London price, 1947–49

Month	1947			1948			1949

[1] Engineering and Mining Journal, New York.
[2] Mining Journal (London) prices in terms of pounds sterling are converted to American dollars by using average rates of exchange recorded by Federal Reserve Board.
[3] London excess.

The price in London was £18 5s. in January 1949, moved to £18 10s. in February, and remained at that level until the pound was devalued in mid-September; thereafter it was £26 5s.

FOREIGN TRADE [11]

More mercury was imported into the United States in 1949 than ever before; the total was 50 percent higher than the previous record for 1945 and over 11 times the annual average for 1930–39. As indicated in the General Summary section, most of the metal entered in 1949 was for the National Stock Pile, being mercury purchased by the ECA with counterpart funds accumulated in Italy. Exports regularly are equivalent to only a small fraction of imports; they amounted to less than 1 percent in 1949. Reexports represented close to 1 percent of imports in 1949.

Imports.—Of the 103,141 flasks of mercury imported for consumption in 1949 (comparison with 1948 in parentheses), 84,894 flasks (3,947) came from Italy, 9,264 (19,384) from Spain, 3,176 (1,256) from Yugoslavia, 3,091 (3,489) from Mexico, 2,709 (3,675) from Japan, and over 6 (none) from Canada. In 1935–39, inclusive, Spain furnished 55 percent of United States imports of mercury and Italy 37 percent.

[11] Figures on imports and exports compiled by M. B. Price and E. D. Page, of the Bureau of Mines, from records of the U. S. Department of Commerce.

General imports are a better measure of goods actually arriving in the country in a given period than are imports for consumption. General imports were 96,918 flasks in 1949 (41,732 in 1948). Of the total 84,628 (4,994) flasks were from Italy, 3,753 (1,691) from Yugoslavia, 3,506 (4,063) from Mexico, 2,777 (3,746) from Japan, 2,225 (27,114) from Spain, and 29 (none) from Canada. In 1948, 75 flasks were received from Sweden and 49 from the United Kingdom.

Imports of mercury compounds generally are insignificant; those of mercuric chloride in 1949 were 25 pounds from the United Kingdom and of mercury preparations not specifically provided for were 44,494 pounds from Sweden.

Exports.—Of the exports of 577 flasks (526—revised—in 1948), 175 (none) went to Denmark, 167 (15) to Korea, 64 (230) to Canada, 32 (28) to Brazil, 25 (31) to Colombia, 24 (17) to Cuba, 18 (81) to Venezuela, and the remainder in quantities of 12 flasks or less to 17 other countries. The reported exports of 259 flasks to Austria in 1948 appears to have been in error.

Reexports totaled 828 flasks (921 in 1948). Of the total, 535 (416) flasks went to Canada, 108 (349) to Brazil, 73 (27) to Colombia, 30 (33) to Belgium and Luxembourg, 27 (45) to Netherlands Antilles, and the remainder in quantities of 19 flasks or less to eight other countries.

Mercury exported from the United States, 1945–49

[1] Revised figure.

WORLD REVIEW

The inability, thus far, of world industry to absorb world output of mercury in post-World War II years led to the drop of close to 40 percent in production in 1948, when the smallest world total since 1935 was recorded. The decrease in 1948 was due chiefly to the reduction to less than half in the contribution from Spain, but also to noteworthy declines for Italy, the United States, and Mexico. In 1949 the world total advanced close to 10 percent, according to preliminary figures, the rise being caused largely by an increase in output in Spain; Italy's rise of 5,800 flasks was counterbalanced in large part by the United States drop of 4,500 flasks.

Algeria.—Only a drastic and unexpected change in the price-cost relation for mercury will prevent the shut-down of Algeria's only producer, the Condiat Stah, Ras-el Ma, from being permanent. The company was reported [12] to be planning to dispose of its mining equipment.

[1] Mercury is also produced in Korea, Yugoslavia, and U. S. S. R., but production data are not available; estimates by senior author of chapter included in total.
[2] Less than 1 flask.
[3] Data not yet available; estimates by author of chapter included in totals.
[4] Included with Germany.
[5] Byproduct of pyrites production in Slovakia only.
[6] Includes Austria.
[7] Estimate.
[8] Preliminary.
[9] Data revised in some instances to represent production rather than shipments.

Mexico.—Mercury output trended downward from the all-time peak of 32,443 flasks, established in 1942, through 1948; the downtrend was reversed in 1949. Production in Mexico in general is high-cost and cannot compete with the chief world suppliers, Spain and Italy. In 1949 the following companies were said to be producing:

Compania Nacional de Minas, S. A. de C. V., Avenida Madero No. 2, Despacho 503, Mexico, D. F.

Oro, Plata y Mercurio, S. A., Edificio America, Despacho 308, Torreon, Coahuila.

Compania Minera e Industrial de Maconi, S. de R. L. Lopez No. 35, Despacho 201, Mexico, D. F.

Sr. Alejandro Gaitan Cortes, Avenida Matamoros 1407 Pte., Torreon, Coahuila.

Explotadora de Mercurio Huahuaxtla, S. A., Avenida 5 de Mayo No. 18, Mexico, D. F.

Credito Minero y Mercantil, S. A., San Juan de Letran No. 11, Mexico, D. F.

In a report [13] on the Huahuaxtla district, total production since discovery of cinnabar, about 1923, was said to approximate 300,000 kilograms of mercury, or 8,700 flasks, nearly half of which was produced during 1940–44, inclusive. The report states that the many small prospects in the district appear to be of little value and that there is little likelihood of discovering another large deposit in

[13] Gallagher, David, and Silicco, Rafael Perez, Geology of the Huahuaxtla Mercury District, State of Guerrero, Mexico: U. S. Geol. Survey Bull. 960-E, 1948, pp. 149–175.

the district, but that the principal deposit looks promising. Ore reserves data are not significant because little ore is developed ahead of extraction.

Spain.—Dissatisfaction in Spain over the unprecedented shipments of mercury from Italy to the United States in 1949, mentioned in the General Summary section, is reported to have led to the dissolution of the Spanish-Italian mercury cartel, Mercurio Europeo, as of the beginning of 1950. Late in 1949 there were rumors that a large quantity of mercury (possibly 40,000 flasks) had been shipped from Spain, through Switzerland, to the U. S. S. R. or its satellites. The rumors were without official confirmation. Spanish production in recent years has fluctuated widely. Output in 1947 was 55,608 flasks and in 1948 only 22,684; it was 32,289 flasks in 1949.

Mica

By Joseph C. Arundale and E. M. Tucker

GENERAL SUMMARY

DOMESTIC production of sheet mica remained small in 1949, but the United States continued to lead the world in production of ground mica. Imports and consumption of splittings increased, as did the production of built-up mica, which is made from splittings. There was increasing interest in the production of scrap mica, and investigations were being made in several areas of its commercial possibilities.

An article [1] described purchasing procedures of the Colonial Mica Co., including grading, classifying, prices, and forms used.

Salient statistics of the mica industry in the United States, 1945–49

	1945	1946	1947	1948	1949
Domestic mica sold or used by producers:					
Total uncut sheet and punch:					
Pounds	1,298,587	1,078,867	415,589	270,042	513,994

Value	$3,415,696	$4,259,478	$6,680,753	$6,300,581	$7,096,365
Imports for consumption.....short tons	9,411	13,944	11,685	17,896	12,720
Exports.....do	981	1,542	1,493	1,403	1,108

DOMESTIC PRODUCTION

The Bureau of Mines issued reports of investigations of mica deposits in New Hampshire,[2] Connecticut,[3] and the Black Hills of South Dakota.[4] The Federal Geological Survey released in open file two folios containing 28 maps of mica deposits in Idaho and Montana.

Sheet Mica.—Production of 513,994 pounds of sheet and punch mica in the United States in 1949 was only a small percentage of the total

consumed, as it has been for many years. Many small producers of mica failed to report, and the Bureau of Mines again found it necessary to depend largely on reports by purchasers in compiling the statistics on domestic production. The high cost of extracting and processing sheet mica leaves the domestic producer in a poor competitive position in relation to foreign sources.

Scrap Mica.—Sales of domestic scrap mica to grinders in 1949 totaled 32,856 short tons valued at $795,782. This figure includes mine

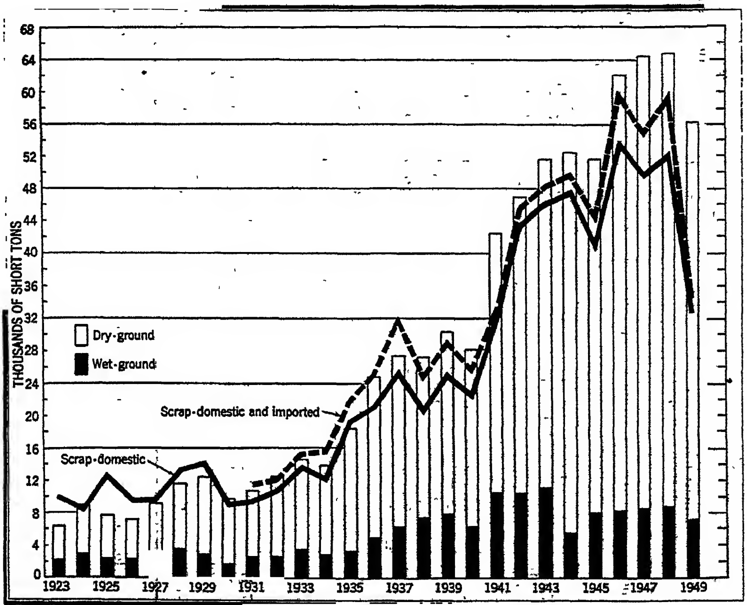

FIGURE 1.—Scrap and ground mica sold in the United States, 1923–49.

scrap, mica reclaimed as a byproduct of kaolin washing, and mica recovered from schist. Together with shop or factory scrap and imported scrap it is the raw material from which ground mica is produced. This figure does not include scrap recovered and used by mica grinders in their own plants.

Scrap and reclaimed mica sold or used by producers in the United States, 1935–39 (average) and 1945–49

	Scrap		Reclaimed [1]		Total	
	Short tons	Value	Short tons	Value	Short tons	Value
1935–39 (average)	13,582	$168,688	8,404	$116,824	21,986	$285,512
1945	26,014	487,807	15,046	324,515	41,060	812,322
1946	38,405	750,883	15,197	290,540	53,602	1,041,423

[1] Includes small quantities of splittings in certain years.
[2] Includes Alabama (1947), Arizona (1947 and 1949), California (1947), Colorado (1948–49), Connecticut (1948), Georgia, Maine, New Hampshire (1948–49) New Mexico (1948), Pennsylvania (1949), and Virginia (1947 and 1949).

A report of the investigation of the use of Humphrey spirals in the recovery of flake mica was published.[5]

Co-operative Mines, Inc., started operations at the Star mine northwest of Ojo Caliente, N. Mex. The company has a mill which is expected to produce 50 tons of mica daily from dumps and new development.[6]

The State Research, Planning and Development Board of South Carolina investigated the commercial possibilities of scrap mica in South Carolina,[7] and there was increased interest in mica in Georgia.[8]

Ground Mica.—Sales of 56,393 short tons of ground mica, valued at $2,860,956, represented a moderate decrease from the previous year but were well above the prewar level.

Southeastern Mica Co. of Spruce Pine, N. C., incorporated and erected a grinding plant in the Spruce Pine district.[9] However, this plant did not produce in 1949.

The Wet Ground Mica Association, Inc., 420 Lexington Ave., New York 17, N. Y., issued a bulletin [10] on the properties and uses of wet-ground mica, based on a research program being carried on by that organization.

Ground mica (including mica from kaolin and schist) sold by producers in the United States, 1945–49, by methods of grinding

Year	Dry-ground		Wet-ground		Total	
	Short tons	Value	Short tons	Value	Short tons	Value
1945	43,686	$1,243,075	8,120	$752,894	51,806	$1,995,969

1949	49,133	1,850,400	7,260	1,010,556	56,393	2,860,956

CONSUMPTION

Sheet, Punch, and Film Mica.—No accurate statistics on consumption of sheet, punch, and film mica are available. However, incomplete reports indicate that consumption declined in 1949, owing probably to the moderate industrial recession and somewhat wider use of substitute or alternate materials. Certain grades and classes of block and film were acquired for the National Stockpile.

Built-Up Mica.—Production of 6,295,268 pounds of built-up mica valued at $13,203,854 was a slight increase in quantity over the previous year but below 1946 and 1947.

An article [12] summarized the production and applications of built-up mica insulation.

Built-up mica produced in the United States, 1947–49, by kinds of product

Product	1947		1948		1949	
	Pounds	Value	Pounds	Value	Pounds	Value
Molding plate	1,660,883	$1,832,779	1,545,401	$2,435,709	1,579,846	$2,131,727
Segment plate	1,920,875	2,513,205	2,008,924	3,614,521	1,727,212	3,041,809
Heater plate	1,248,461	2,351,901	1,033,995	2,126,367	1,033,035	1,965,678
Flexible (cold)	677,801	973,247	339,509	575,066	431,660	677,753
All other (tape, etc.)	1,388,094	3,741,913	1,020,989	3,792,278	1,523,515	5,386,887
Total	6,896,114	11,413,045	5,948,818	12,543,941	6,295,268	13,203,854

Ground Mica.—In the first part of 1949 sales of ground mica were slow, due to a moderate decrease in consumption and a tendency of consumers to reduce inventories. Market conditions improved in the latter part of the year. The roofing industry remained the largest consumer, taking 52 percent of the total. The paint industry was the second-largest consumer, and the natural and synthetic rubber industry used the next largest tonnage as an inert filler and dusting agent.

Ground mica (including mica from kaolin and schist) sold by producers in the United States to various industries, 1948–49

Industry	1948			1949		
	Short tons	Percent of total	Value	Short tons	Percent of total	Value
Roofing	[1] 32,969	[1] 51	[1] $1,074,322	29,481	52	$939,587

Total	64,642	100	3,232,632	56,393	100	2,860,956

[1] Revised figure.
[2] Includes mica used for molded electric insulation, house insulation, Christmas-tree snow, manufacture of axle greases and oil, annealing, pipeline enamel, oil-well drilling, welding, and other purposes.

PRICES

Prices received for domestic sheet and punch mica vary greatly and generally are determined by direct negotiation between buyer and seller after agreement as to the quality of particular lots. Therefore, the following quotations from E&MJ Metal and Mineral Markets serve only as a general guide and represent a range of prices during 1949: North Carolina district, clear sheet, punch, 12 to 22 cents per pound, according to size and quality; sheet, 1½ by 2 inches, 70 to

[12] South African Mining and Engineering Journal, Production of Micanite: Vol. 60, No. 2966, Dec. 17, 1949, pp. 507-509.

75 cents per pound; 2 by 2 inches, $1.00 to $1.20; 2 by 3 inches, $1.40 to $1.65; 3 by 3 inches, $1.70 to $2.10; 3 by 4 inches, $2.10 to $2.65; 3 by 5 inches, $2.40 to $3.25; 4 by 6 inches, $3.15 to $3.75; 6 by 8 inches, $4.00 to $6.00; stained or electric mica was sold at approximately the same prices as clear sheet.

North Carolina wet-ground mica ranged from $120 to $175 per ton during 1949, depending on fineness and quantity; dry-ground, from $32.50 to $80; scrap, $25 to $35, depending on quality.

South Dakota punch and untrimmed sheet, selected to contain a minimum area of 20 percent sound mica, cut to circle designated: 2-inch, highest quality, 45 cents; average grade, 30 cents; lowest quality, 20 cents; 1 inch, 5 cents to 25 cents, according to grade.

FOREIGN TRADE [13]

Imports.—In 1949 imports of mica of all types totaled 12,720 short tons valued at $19,334,309, compared with 17,896 short tons valued at $15,546,056 in 1948. Most of this decrease was attributed to greatly reduced imports of scrap mica. Imports of muscovite splittings from India, the principal supplier, increased. Imports of muscovite block from Brazil, the leading source of this type, decreased, and deliveries were reported slow. Splittings reported from United Kingdom are Indian splittings, and those reported from Mexico are believed to be largely Brazilian block split in Mexico.

Mica imported into and exported from the United States in 1945–49

Year	Imports for consumption								Exports

Exports.—The quantity of mica and mica products exported from the United States continued to decrease, although exports of ground mica were only slightly less than in the previous year. There was a marked increase in the number of countries to which unmanufactured mica was shipped.

[13] Figures on imports and exports compiled by M. B. Price and E. D. Page, of the Bureau of Mines, from records of the U. S. Department of Commerce.

[2] Revised figure.

TECHNOLOGY

A fluorine-phlogopite type of mica has been synthesized in a research program involving the National Bureau of Standards, the Federal Bureau of Mines, and the Colorado School of Mines, under the sponsorship and coordination of the Office of Naval Research. However, there remains the problem of orientation of the crystals produced, and the prospects of producing usable crystals at prices competitive with natural mica are speculative at present.

The American Society for Testing Materials, in cooperation with the Mica Fabricators' Association of New York, has established visual photographic color transparencies for the classification of block mica. These standards consist of one 8-by-10-inch original color transparency for each of 10 representative classes and illustrate the maximum, nominal, and minimum imperfections allowed in each case.[14]

New tentative methods of testing glass-bonded mica were accepted by Committee D-9 on Electrical Insulating Materials, American Society for Testing Materials. These methods cover tests required for investigation or examination of this material for use as electrical insulation.[15]

WORLD REVIEW

Argentina.—The most important deposits of muscovite mica in Argentina are in the Provinces of Catamarca, Cordoba, San Juan, and San Luis. A detailed study of the physical and mineralogical properties of this mineral was made.[16]

A special export rate of 7.1964 pesos per $1 United States currency was established for mica exports from Argentina under a revised exchange structure. This preferential rate is expected to stimulate the export of Argentine mica, particularly to the United States.[17]

World production of mica by countries,[1] 1943–49, in metric tons

Australia.—Mica is produced in the Hart Ranges and Plenty River area, Northern Territory of Australia, and stimulation of production has been undertaken by the Department of Supply and Development. Survey work was begun on mapping the field.[18]

India.—The mica mines of Bihar are to be served electric power by the new powerhouse of the Sindri fertilizer plant. This power plant was expected to be completed by December 1949, with an installed capacity of 80,000 kw.[19]

A committee of the Indian Standards Institute prepared a draft report entitled "Indian Standard Methods for Grading Processed Mica." This proposal describes a standard grading system for unmanufactured processed mica according to size, including methods of trimming and definitions of relevant terms used in the trade. A draft report entitled "Indian Specifications of Processed Mica" also was prepared. This describes standard classifications for all commercial forms of unmanufactured processed mica according to visual qualities and structural imperfections. It is reported that final action on these draft reports will not be taken until after the meeting of the International Committee on Mica Standards, expected to be held in Delhi in January 1950 under the chairmanship of the Indian Standards Institution.[20]

Madagascar.—On October 29, 1949, the "Journal Officiel de Madagascar et Dependances" published an order, dated October 24, of the High Commissioner, removing the official f. o. b. prices set for mica exported from Madagascar. Effective November 1, 1949, mica may be sold to France and foreign countries at prices free of control. However, the dollars or other foreign currency must continue to be delivered to the Government. If the export price should appear abnormally low, the Service of Mines may set a different value for computing the mining tax on the mica exported.[21]

Tanganyika.—A small plant was erected by Kunge Mica Mines to treat 3,000 tons of scrap mica at the company property on the east side of Lake Tanganyika. This company is reported to have produced about 30 tons of block mica annually during the war.[22]

Union of South Africa.—Production of mica in the Transvaal decreased in 1949 due to a labor shortage. New deposits were opened up along the Klein Letaba river.[23]

Molybdenum

By Hubert W. Davis

GENERAL SUMMARY

SUBSTANTIAL declines in the outputs of triple-alloy steel containing nickel, chromium, and molybdenum, chromium-molybdenum alloy steel, and molybdenum-type (6 percent molybdenum and 6 percent tungsten) high-speed steels and a smaller drop in production of molybdenum steel were largely responsible for a 37-percent decrease in shipments of molybdic oxide, calcium molybdate, and ferromolybdenum to domestic consumers in 1949. The smaller demand was also partly the result of unusually large purchases made before the price increase effective January 1, 1949. Exports of molybdic oxide, calcium molybdate, and ferromolybdenum, however, were up 8 percent; production declined 20 percent. Output and shipments of molybdenum metal and ammonium molybdate also declined; but production of sodium molybdate increased substantially, and shipments were virtually the same in both years. As a consequence of the lessened demand for molybdenum products in 1949, the quantity of concentrates converted to oxide was 21 percent smaller than in 1948.

Production and shipments of molybdenum concentrates were 16 and 22 percent, respectively, less in 1949 than in 1948. Colorado retained first place as a molybdenum-producing State; and Arizona, which advanced from fifth to fourth place, was the only State to record an increase in output.

Salient statistics of molybdenum concentrates in the United States, 1945–49, in thousands of pounds of contained molybdenum

	1945	1946	1947	1948	1949
Production	30,802	18,218	27,047	26,706	22,539
Shipments (including exports)	33,683	16,787	22,190	29,669	23,280
Exports [1]	2,863	565	2,989	4,132	5,320
Imports for consumption [2]	204	(3)			48
Consumption	32,696	14,994	20,221	25,156	19,960
Stocks (industry), Dec. 31 [4]	16,883	19,275	23,661	21,206	19,159

[1] Includes roasted concentrates.
[2] Excludes imports for conversion and reexport as follows: 1945, 460,416 pounds; 1946, 276,465 pounds; 1947–49, none.
[3] 10 pounds.
[4] At mines and at plants making molybdenum products.

A small quantity of molybdenum concentrates—the first since 1946—was imported into the United States in 1949.

Industry stocks of molybdenum concentrates were 10 percent less at the end of 1949 than at the close of 1948. However, stocks of molybdenum products held by producers gained 44 percent.

Effective January 1, 1949, the quoted prices of molybdenite concentrate, molybdic oxide, calcium molybdate, and ferromolybdenum were advanced 15 cents a pound of contained molybdenum.

DOMESTIC PRODUCTION

Production of molybdenum concentrates totaled 22,530,000 pounds (contained molybdenum) in 1949, a decrease of 16 percent from 1948. The chief mineral of molybdenum is molybdenite (MoS_2), which comprised virtually the entire output in 1949; powellite [$Ca(Mo,W)O_4$] contributed a relatively small quantity. Wulfenite ($PbMoO_4$), once mined from several deposits in southwestern United States, has not been produced since 1944.

Molybdenum was produced in six States in 1949; Colorado led, followed in order by Utah, New Mexico, Arizona, California, and Nevada. Arizona was the only State to show an increase in 1949. Output of concentrates at mines operated solely or almost solely for molybdenum was 10,960,000 pounds in 1949, a decrease of 18 percent from 1948, whereas byproduct concentrates from copper and tungsten operations totaled 11,570,000 pounds, a drop of 13 percent. Byproduct molybdenum represented 51 percent of the total concentrates produced in 1949 compared with nearly 50 percent in 1948.

Shipments of molybdenum concentrates were 23,280,000 pounds (contained molybdenum) in 1949, a decrease of 22 percent from 1948. The shipments in 1949 comprised 18,993,000 pounds to domestic consumers and 4,287,000 pounds for export.

A historical review of the molybdenum industry in the United States and a table showing its spectacular growth were presented in the chapter of this series in Minerals Yearbook, 1948, pp. 816–819.

Molybdenum in ore and concentrates produced and shipped from mines in the United States, 1940–49

Year	Production (pounds)	Shipped from mines		Year	Production (pounds)	Shipped from mines	
		Pounds [1]	Value [2]			Pounds [1]	Value [2]
1940	34,313,000	25,329,000	$17,189,000	1945	30,802,000	33,683,000	$23,976,000
1941	40,363,000	38,377,000	25,996,000	1946	18,218,000	16,786,600	11,529,000
1942	56,942,000	66,437,000	47,275,000	1947	27,047,000	22,189,800	15,178,000
1943	61,667,000	53,955,000	38,500,000	1948	26,706,000	29,669,000	20,418,000
1944	38,679,000	39,423,000	27,999,000	1949	22,530,000	23,280,000	19,332,000

[1] Figures for 1940–44 represent shipments from mines, plus concentrates converted to oxide by producer at Miami, Ariz.; those for 1945–49 represent shipments to domestic and foreign customers, plus concentrates converted to oxide at Miami, Ariz., and Langeloth, Pa.
[2] Largely estimated by Bureau of Mines.

Arizona.—The Miami Copper Co. was the sole producer of molybdenum in Arizona in 1948 and 1949. Since 1938 the company has been a regular producer of molybdenite, which is recovered as a byproduct of its copper operations at Miami, Ariz. The concentrates are converted to molybdic oxide at Miami; output in 1949 reversed a 2-year downward trend and was 30 percent greater than in 1948. Arizona advanced from fifth to fourth place as a producer of molybdenum in 1949.

Research on the separation of the minute quantity of molybdenite contained in the copper ore at the Morenci mine, Greenlee County, of Phelps Dodge Corp. was about completed in 1949, and production of molybdenite concentrate was begun early in 1950.

California.—California dropped from fourth to fifth place as a producer of molybdenum in 1949. The only producer in California was the United States Vanadium Corp. at Bishop, where the mineral is recovered as a byproduct of tungsten production. The treatment plant of the company was operated at a greatly reduced rate in 1949; as a consequence, recovery of molybdenum was 53 percent less than in 1948. Molybdenum occurs as molybdenite and powellite, which comprised 88 and 12 percent, respectively, of the output in 1949.

Colorado.—Colorado was again the premier molybdenum-producing State. The Climax Molybdenum Co., operating the world-famous deposit at Climax, Colo., was the sole producer of molybdenum concentrates in Colorado in 1949; output was 18 percent smaller than in 1948. Previous to 1948 the Climax deposit had been exploited solely for molybdenum, but in 1948 recovery of tungsten and in 1949 recovery of tin as byproducts were inaugurated. Most of its 1949 output of molybdenite concentrates was shipped to its processing plant at Langeloth, Pa., where the company produces ferromolybdenum, calcium molybdate, molybdic oxide, and other molybdenum products, as well as ferrotungsten.

Nevada.—Since 1941 the Nevada Mines Division of the Kennecott Copper Corp. has been the lone producer of molybdenite concentrates in Nevada. The concentrates are recovered as a byproduct of the McGill concentrator, where copper ores from the company Ruth and Copper Flat operations and from the Emma Nevada group of Consolidated Coppermines Corp. are milled. Output of concentrates was 42 percent less than in 1948 and was the smallest since recovery was inaugurated in 1941.

New Mexico.—The Chino Mines Division of the Kennecott Copper Corp., Hurley, and the Molybdenum Corp. of America, Questa, continued to be the only producers of molybdenite in New Mexico in 1949. The outputs of these producers were 33 and 4 percent, respectively, smaller than in 1948; State output was 27 percent less. At Hurley, molybdenite has been recovered as a byproduct of copper operations since 1937. The Questa mine, which is operated for molybdenum only and is outstanding in richness of the ore, was opened in 1919 and since 1923 has been a regular producer. The concentrates produced at Questa are shipped to the processing plant of the Molybdenum Corp. of America at Washington, Pa., where the company produces ferromolybdenum, calcium molybdate, molybdic oxide, and other molybdenum products.

Utah.—Utah was again the second largest molybdenum-producing State. The sole producer in Utah is the Utah Copper Division of the Kennecott Copper Corp., which since 1936 has been recovering molybdenite as a byproduct of copper at its Arthur and Magna concentrators. Output of molybdenite concentrates in Utah was 10 percent less in 1949 than in 1948.

CONSUMPTION AND USES

Consumption (as measured by shipments to domestic consumers) of molybdenum products in the United States was 37 percent smaller in 1949 than in 1948. The largest single use for molybdenum is as an alloying element in the manufacture of steels, to which it is added as molybdic oxide, calcium molybdate, or ferromolybdenum. In general, when an entire open-hearth heat is to be alloyed to a degree not exceeding 0.8 percent molybdenum, the addition is in the form of molybdic oxide or calcium molybdate; ferromolybdenum is used when higher percentages of molybdenum are desired. Of the total molybdenum used in the United States, it is estimated that about 70 percent is in steels. The addition of molybdenum to conventional 18:8 (18 percent chromium and 8 percent nickel) stainless steel has, it is reported,[1] produced a popular casting alloy with improved corrosion resistance and increased strength at elevated temperatures. Molybdenum is finding an expanding market in the high-temperature alloys developed for various components of gas turbines, as well as in jet aircraft engines and turbosuperchargers. Use of tungsten-molybdenum thermocouples in the study of high-temperature alloys is reported [2] to have resulted in improvement of the range of satisfactory service up to 3,990° F. It is also reported [3] that both the oxidation resistance and strength of molybdenum may be improved by making certain alloying additions and that such alloys can be successfully arc-melted and cast in an argon atmosphere. High-temperature ceramic coatings for molybdenum have been developed.

Much smaller quantities (about 20 percent of the total) of molybdenum, chiefly in the form of ferromolybdenum and molybdic oxide, are employed in gray iron and malleable castings. Molybdenum in various forms finds limited employment in the chemical, electrical, and ceramic industries, which account for about 10 percent of the total. A relatively small quantity of concentrates (50,000 to 75,000 pounds of contained molybdenum annually) is used by a few steel companies as an addition to molten metal in the ladle to raise the sulfur content to improve machinability, in addition to gaining the benefit of the contained molybdenum. Molybdenum is being used with remarkable success as a fertilizer, and it is reported that certain crop yields have doubled as a result of minute additions to the soil.

Production and shipments of molybdenum products[1] in the United States, 1945–49, in pounds of contained molybdenum

Year	Production	Shipments		
		To domestic consumers	Exports[2]	Total
1945	32,406,300	26,977,200	1,327,000	28,304,200
1946	15,039,100	16,501,700	442,400	16,944,100
1947	20,659,700	19,878,500	866,400	20,744,900
1948	24,445,300	23,808,900	1,215,800	25,024,700
1949	19,624,200	15,019,000	1,314,100	16,333,100

[1] Comprises ferromolybdenum, molybdic oxide, and molybdenum salts and metal.
[2] Reported by producers to the Bureau of Mines.

STOCKS

The accompanying table shows industry stocks of molybdenum concentrates and products, 1945–49.

Industry stocks of molybdenum concentrates and products, Dec. 31, 1945–49, in thousands of pounds of contained molybdenum

Year	Concentrates[1]	Products[2]		Total
		Producers	Consumers	
1945	16,883	10,176	2,653	29,712
1946	19,275	8,211	2,582	30,068
1947	23,661	8,126	2,695	34,482
1948	21,206	7,547	(3)	[4] 28,753
1949	19,159	10,838	(3)	[4] 29,997

[1] At mines and at plants making molybdenum products.
[2] Comprises ferromolybdenum, molybdic oxide, molybdenum salts, and metal.
[3] Figure not available.
[4] Excludes stocks of molybdenum products at consumers' plants.

PRICES

Effective January 1, 1949, the published price, f. o. b. mines, of molybdenite in concentrates containing 90 percent MoS_2, was increased to 54 cents a pound of MoS_2 (equivalent to 90 cents a pound of molybdenum contained). The former price of 45 cents a pound of MoS_2 had been in effect since 1938. Molybdenum concentrates are shipped largely to processing plants for conversion to molybdic oxide, the form in which most molybdenum is employed in iron and steel plants. Some oxide, however, is employed in making ferromolybdenum and calcium molybdate, which are also used in the manufacture of iron and steel. The prices of the principal molybdenum products are based on a pound of contained molybdenum, f. o. b. producer's plant. Effective January 1, 1949, the prices of molybdic oxide and calcium molybdate were raised to 95 cents a pound of contained molybdenum and of ferromolybdenum to $1.10; the former prices were 80 and 95 cents, respectively.

FOREIGN TRADE[4]

Imports of molybdenum ore and concentrates into the United States are normally small; 48,148 pounds (contained molybdenum) were received from China in 1949 compared with none in 1948. Some molybdenum ore and concentrates are occasionally imported for conversion to molybdenum products for export; none has been so imported since 1946.

Exports of molybdenum concentrates (including roasted concentrates) were 5,319,780 pounds (contained molybdenum) in 1949 compared with 4,132,341 pounds in 1948. Taking 52 and 29 percent, respectively, the United Kingdom and France were the chief foreign markets in 1949; Sweden and Germany took 10 and 5 percent, respectively.

Exports of ferromolybdenum were 955,103 pounds (gross weight) in 1949 compared with 1,188,949 pounds in 1948, and those of molybdenum metal and alloys were 78,479 pounds compared with 56,303 pounds in 1948.

Tariff.—The duty on molybdenum ore and concentrates continued to be 17½ cents a pound on the metallic molybdenum contained; and on ferromolybdenum, molybdenum metal and powder, calcium molybdate, and other compounds and alloys of molybdenum it was 50 cents a pound of molybdenum contained plus 15 percent ad valorem.

Molybdenum ore and concentrates (including roasted concentrates) exported from the United States, 1947–49, by countries

[U. S. Department of Commerce]

Country	1947		1948		1949	
	Molybdenum content (pounds)	Value	Molybdenum content (pounds)	Value	Molybdenum content (pounds)	Value

WORLD REVIEW

Despite the fact that molybdenum is produced in many parts of the world, the combined output of all countries other than the United States is less than 15 percent of the world total, and most of that comes from a few countries.

World production of molybdenum in ores and concentrates, by countries, 1940–49, in metric tons [1]

[1] Molybdenum is also produced in Greece, Rumania, Turkey, U. S. S. R., and Yugoslavia, but production data are not available. Estimates by author of chapter are included in total.
[2] Less than 1 ton.
[3] Data not yet available; estimate by author of chapter included in total.
[4] Exports to Japan proper.
[5] Data represent areas designated as Free China during the period of Japanese occupation.
[6] Preliminary data for fiscal year ended Mar. 31 of year following that stated.

Canada.—According to the Dominion Bureau of Statistics, there was no production of molybdenite in Canada in 1949 compared with 291,150 pounds in 1948, presumably from the La Corne mine in Quebec.

Chile.—Since 1939, Chile has been a regular producer of molybdenite concentrate; and since output was discontinued by the Greene Cananea Copper Co. in Mexico, it has been the largest producing foreign country. Output of molybdenite in Chile was 930 metric tons in 1949 compared with 887 tons in 1948.

Sweden.[5]—Molybdenum deposits have been found in Snavlunda, Orebro Province, Sweden. Mining rights have been acquired by Gullspang Elecktrokemiska AB, Gullspang, a smelting company.

United Kingdom.—Imports of molybdenum concentrates into the United Kingdom were 2,405 long tons during the first 11 months of 1949 compared with 2,287 tons in 1948.

Yugoslavia.—A new molybdenum mine near Maĉkatica, Serbia, will begin operation by 1951.[6]

Natural Gas

By D. S. Colby, F. S. Lott, and B. E. Oppegard

GENERAL SUMMARY

MARKETED production of natural gas is estimated to have increased about 7 percent to 5,487 billion cubic feet in 1949. The production of gas from oil wells was reduced as a result of decreased production of domestic crude oil. Consumption of natural gas for domestic uses is estimated to have increased 10 percent, compared with 12 percent in 1948, and commercial consumption is estimated to have increased 16 percent, compared with 13 percent in 1948. An over-all increase in industrial consumption of 4 percent is anticipated in 1949. This total is held down by decreases in the quantities consumed at petroleum refineries and at carbon-black plants. Electric

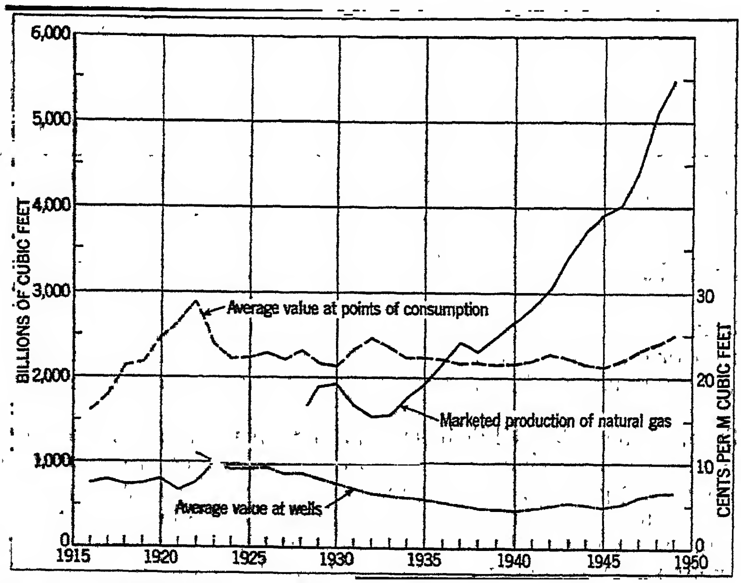

FIGURE 1.—Production and value of natural gas in the United States, 1916–49.

public-utility power plants, however, consumed 15 percent more natural gas than in 1948.

The average value of natural gas at the well remained 6.5 cents per thousand cubic feet in 1949. The average value increased in most States, but reduced production in the high-value States kept the over-all average down. At the point of consumption the average values of natural gas for domestic and commercial purposes are estimated to have increased to 67.5 and 45.0 cents per thousand cubic

feet, respectively. The value of gas for industrial purposes, however, is thought to have declined slightly to 12.3 cents per thousand cubic feet. The total value of natural gas marketed in 1949 on this basis was 1,316 million dollars as compared with 1,194 million in 1948. This gas was used by over 16 million consumers, either as "straight" natural gas or mixed with manufactured gas.

OUTLOOK

The growth and planned expansion of the natural-gas industry continued in 1949 in spite of the mild business recession in the first part of the year. The shortage of steel, which had hampered pipeline construction and appliance manufacture, disappeared almost entirely by the end of 1949. Restrictions on the installation of space-heating equipment were being relaxed as additional supplies of gas became available. Added impetus to conversion of consuming equipment from coal has been given by the uncertainty of coal supplies due to the increasing labor disturbances in the coal fields. This conversion is taking place in electric public utilities as well as in homes and factories. The present advantageous price position of natural gas relative to other fuels probably will continue under the controls of the Federal Power Commission and State public utility commissions.

Several factors in addition to increasing demand and costs tend to raise natural-gas prices. Both Kansas and Oklahoma have instituted minimum wellhead price regulation. Several bills were presented to the Congress which would have limited Federal Power Commission authority to companies conducting interstate business. State legislatures have considered, though not always favorably, bills to increase severance taxes and taxes on the gross revenue of utilities.

The major operating problems of gas-utility companies continue to be how best to utilize natural gas as it becomes available and how to meet peak-load requirements. Storage of natural gas or LP-gases is meeting this latter problem in some regions, while standby manufactured-gas plants provide peak supplies in others. Among the alternatives that can be adopted by distributing companies as new

supplies of natural gas reach their communities are complete conversion to natural gas, use of natural gas for base load supplemented by other gases during high-demand periods, re-forming the natural gas, or the use of natural to enrich manufactured gas.

Authorizations and specific plans for new construction, based upon the favorable position of natural gas with respect to available supplies and competitive fuels, appear to assure continued rapid growth in natural-gas sales for the next several years. Emphasis will be upon service to new consumers in areas far removed from the major sources of supply.

GOVERNMENT REGULATIONS

The authority of the Texas Railroad Commission to shut down an oil field to eliminate flaring of gas was upheld by the Texas Supreme Court.

It has long been suggested that State conservation commissions be given power to set minimum field prices for gas in order to enforce ratable take and protect the correlative rights of individual producers within a field. On February 18, 1949, the Kansas Corporation Commission set a minimum wellhead price for natural gas in the Kansas Hugoton field. The State Supreme Court will rule on the legality of this in 1950. In April 1949 the Oklahoma Senate passed a bill authorizing the State corporation commission to control the minimum price of natural gas within that State. The Oklahoma Corporation Commission had attempted in 1947 to set a minimum price under then existing statutes.

The United States Supreme Court in June 1949 ruled that the Federal Power Commission could not regulate the sale of a natural-gas company's reserves. In a decision of January 9, 1950, it ruled against the East Ohio Gas Co. in upholding the Federal Power Commission's authority over this company, although all of its business and facilities are in Ohio. Bills have been introduced into the United States Congress by Ohio Congressmen in an effort to exclude from the definition of "natural-gas company" any person who receives his supply of gas within or at the border of the State wherein he is engaged in local distribution.

A great deal of confusion has arisen over the extent to which the Federal Power Commission has control over independent producers and distributors of natural gas. A bill introduced in 1949 into the United States Senate provided that Federal Power Commission jurisdiction should not apply to natural-gas exploration, drilling, production or gathering, sale at arms length, sale before arms length sale to interstate facilities, local distribution, and local distribution facilities. This bill was passed by both the United States Senate and the United States House of Representatives in 1950 but was vetoed by President Truman.

RESERVES

The committee on natural-gas reserves of the American Gas Association reported proved reserves of natural gas in the United States to be 180,381,000 million cubic feet as of December 31, 1949. This represents a net increase of 4 percent over 1948. The gross addition to proved reserves in 1949 comprised 8.1 trillion cubic feet in extensions of old fields and 4.6 trillion cubic feet in new fields and pools.

Estimated proved recoverable reserves of natural gas in the United States, 1948–49, in millions of cubic feet [1]

1 Volumes are reported at a pressure base of 14.65 pounds per square inch absolute and at a standard temperature of 60° F.
2 Excludes gas loss due to natural-gas liquids recovery.
3 The net difference between gas stored in and gas withdrawn from underground storage reservoirs.
4 Net production equals gross withdrawals less gas injected into underground reservoirs; changes in underground storage are excluded. December production estimated occasionally.
5 Nonassociated gas is free gas not in contact with crude oil in the reservoir.
6 Associated gas is free gas in contact with crude oil in the reservoir.
7 Dissolved gas is gas in solution with crude oil in the reservoir.
8 Gas held in underground reservoirs for storage purposes only.
9 Includes Alabama, Florida, Maryland, Missouri, Nebraska, and Virginia.

Proved reserves of natural-gas liquids as of December 31, 1949, reported by this committee, were 3,729,012,000 barrels, 5 percent greater than in 1948.

PRODUCTION

GROSS PRODUCTION

Estimated gross production of natural gas in the United States in 1948 was 7,179,000 million cubic feet, an increase of 7 percent over the 1947 production of 6,733,000 million cubic feet. An increased proportion of gas in 1948 was produced from gas wells as compared to oil wells. Gas production from gas wells increased 22 percent, while gas produced from oil wells decreased 13 percent in 1948 as compared to 1947. In 1948 Mississippi again showed the largest percentage increase in gas production—45 percent—and Texas showed the greatest actual gain—208,000 million cubic feet. Production over the last 3 years has decreased in the Michigan and Illinois Basins and in the Appalachian States, except West Virginia. Gas from the large producing States of the Southwest is now being piped in increasing quantities into the markets that can no longer be completely satisfied by these less productive States.

Repressuring and recycling continue to grow in importance as means of increasing the recovery from oil and condensate fields. In 1948, 1,221,000 million cubic feet of gas were used for these purposes—an increase of 137,000 million feet above 1947.

Storage of natural gas in depleted fields close to consuming centers is advantageous as a means of providing fuel for peak demand periods in those communities that receive gas via long transmission lines. The States that have been long-time producers of gas are those best able to use this means of storage. Pennsylvania, Ohio, and West Virginia stored the largest quantities of gas in 1948. The total volume placed in storage in the United States was 136,406 million cubic feet, and the net volume stored was 57,371 million cubic feet—increases over 1947 of 40,090 and 47,698 million cubic feet, respectively. The quantities used for repressuring and recycling and the net quantity placed in storage when subtracted from the estimated gross production provide the volume removed from reserves. This quantity in 1948 was 5,900,827 million cubic feet, an increase of 5 percent over 1947. The percentage increase in withdrawals from reserves is smaller than the corresponding increase in production because of the large reduction in the volume of "vented and waste." This decreased from 1,067,938 million cubic feet in 1947 to 810,178 million cubic feet in 1948. Most of this reduction occurred in Texas and resulted from reduced wastage of casinghead gas from oil wells.

Gross production and disposition of natural gas in the United States, 1947–48, by States, in million cubic feet

MARKETED PRODUCTION

Marketed production of natural gas in 1948 increased 12 percent to 5,148,020 million cubic feet. This quantity includes gas stored and that lost in transmission. Texas, Louisiana, California, and Oklahoma remain the largest suppliers of marketed gas.

Beginning with 1947 statistics, marketed production of natural gas was reported on a new basis to include net volume stored and lost in transmission. Figures for years before 1947 were not tabulated on a basis comparable with the new series, but estimates for 1929–46 on the new basis are compared in the following table with the old series.

Year	Million cubic feet		Year	Million cubic feet	
	Old basis	New basis		Old basis	New basis
1929	1,917,693	1,952,166	1939	2,476,756	2,538,383
1930	1,943,421	1,978,911	1940	2,660,222	2,733,819
1931	1,686,436	1,721,902	1941	2,812,658	2,893,525

[6] Less than $500.
[7] Includes 16,324 million cubic feet piped to Mexico.

NUMBER OF WELLS

In 1948, 2,897 new gas wells were drilled and 2,355 were abandoned, which left 64,212 active wells at the end of the year. The over-all number of completions in 1949 was 2,887, very close to the 1948 figure. Large changes did take place in regional drilling activity in 1949. An increased number of wells was drilled in Texas and Louisiana and a decreased number in West Virginia and Ohio.

Drilling did not offset abandonments in 1948 in Indiana, Michigan, New York, Ohio, and Pennsylvania. Abandonments were highest in Ohio (597) and Pennsylvania (528). In Texas 442 wells were abandoned; but new drilling offset this, and the number of active wells increased in 1948 by 100.

Gas wells in the United States, 1947–49, by States

State	Producing Dec. 31, 1947	Drilled during 1948 [1]	Producing Dec. 31, 1948	Drilled during 1949 [1]

[2] Tennessee included with Kentucky.
[3] Includes Nebraska.

DEVELOPMENT AND PRODUCTION BY STATES[1]

Arkansas.—J. W. Sanders, chief engineer, Arkansas Oil and Gas Commission, reports that gas production from oil and condensate wells in south Arkansas decreased in 1949 to 58,880 million cubic feet from 65,620 million in 1948. This decrease is attributed to the reduction in allowables in controlled oil and condensate fields. Production from gas wells in north Arkansas increased from 5,703 million cubic feet in 1948 to 6,901 in 1949. The number of producing wells here on December 31, 1949, was 187, two less than the previous year. Two new gas fields were discovered—the Cecil field in Franklin County and the Rudy field in Crawford County. Neither were completely tested at year end. The Columbia pool remained shut-in for lack of market.

[1] Based on latest available trade publications and reports from Federal and State agencies.

California.—The California Department of Natural Resources reports that the net withdrawal of natural gas from formation in 1949 was 546,026 million cubic feet compared with 571,643 million in 1948. The 1949 production comprised 165,267 million cubic feet from dry gas wells, 380,759 million from oil wells, and in addition 35,118 million shrinkage at gasoline and recycling plants. The receipts of natural gas via pipeline from Texas increased from 65,560 million cubic feet in 1948 to 94,099 million in 1949.

Eight wildcat gas wells and 32 development wells are reported to have been completed during the year. Reserves added by discovery and development did not equal production in 1949, and estimated reserves of natural gas decreased by 201,000 million cubic feet.

Colorado.—J. R. Schwabrow, Federal Geological Survey, reports that the only gas discovery in Colorado in 1949 was Asbury Creek field in Mesa County. One noncommercial well was completed there which produced from the Dakota formations at 2,836 to 2,933 feet. Three outpost wells drilled in the Dove Creek field, a 1948 discovery, were dry.

A gasoline plant completed at the end of 1948 in the Rangely field treated 5,406 million cubic feet of gas in 1949.

Net production increased from 9,002 million cubic feet in 1948 to 13,529 million in 1949. This increase is attributed almost entirely to increased field use and larger losses in the Rangely field.

Illinois.—A. H. Bell and D. H. Swann, Illinois Geological Survey Division, report that two gas wells in the Dudley pool and one each in the Waverly and Omaha fields were completed and shut-in during 1949. Two gas wells in Louden field and one in Cottonwood field were completed and are producing. One well in Flat Rock field, formerly shut-in, was opened during 1949.

It is estimated that nearly 60 billion cubic feet of casinghead gas were produced in 1949, of which approximately 45 billion were used untreated in the field or vented. Only 13.5 billion cubic feet were treated at natural-gasoline plants. Of the resulting 9.5 billion cubic feet of residue gas, 3.1 billion were returned to the formation and about 6.0 billion were used as plant and lease fuel. Other natural gas marketed amounted to 378 million cubic feet.

Indiana.—H. R. Brown of the Indiana Department of Conservation reports that 35 gas wells were completed in 1949. The reserves committee of the American Gas Association reported net natural-gas production of 6,250 million cubic feet in 1949 compared with 5,504 million in 1948.

Kansas.—Earl K. Nixon, Kansas State Geological Survey, reports that four new gas pools were discovered in Kansas in 1949. The Jones pool and Jones Northeast pool, both in Harvey County, produce from the Mississippian formation. In Cowley County, the Mansur pool produces from the Layton sand and the Kansas City-Lansing limestone, and the New Salem pool from the Layton sand.

The west side of the Hugoton field in Morton County was extended 6 or 7 miles by completion of two outpost wells, each rated at nearly 10 million cubic feet per day. Its eastern boundary in Seward County was extended by a score or more wells with initial capacities of 15 to 25 million cubic feet daily. Approximately 91,000 acres were added

to the total area of the Hugoton field, which totaled 2,005,500 acres as of the end of 1949.

In 1949, 425 gas wells were completed in Kansas compared with 351 in 1948. The Hugoton field accounted for 405 of the 1949 completions. Natural-gas production in 1949 is reported to have been 263 billion cubic feet. The Hugoton field, producing from 1,847 wells, accounted for 221 billion cubic feet, an increase of 33 percent over 1948.

Kentucky.—C. D. Hunter, chief geologist, Kentucky West Virginia Gas Co., reports that gas-well completions in 1949 were just slightly below the 1948 figure. In all, 189 wells with an initial open-flow capacity of 163 million cubic feet per day were completed in the State. Of these wells, 149 were in the Big Sandy field. Only two wildcat gas wells were brought in in 1949. Both were in the less productive western part of the State.

The committee on natural-gas reserves of the American Gas Association estimates 1949 net production to have been 90,000 million cubic feet. This was greater than the quantity of new reserves discovered and estimates of proved reserves decreased by 29,000 million cubic feet.

Louisiana.—The Louisiana Department of Conservation Petroleum Activity Report for 1949 reports production of natural gas for the year to have been 1,018,262 million cubic feet. This was 5 percent above the production for 1948. It was reported that 377 gas and condensate wells were completed in 1949, of which 137 were in the Monroe field. Wildcat discoveries included 15 gas-condensate wells and 5 gas wells. The gas-well discoveries, by field and parish, were Midland, Acadia; South Arnaudville, St. Martin; West Delta Block 27 and Block 30, Plaquemines; and South Sarepta, Bossier. Gas-condensate discoveries by field and parish were Bayou Plaquemines, Iberville; Black Bay, Plaquemines; Burton, St. James; Eugene Island Block 110, South Tiger Lagoon, and Lake Sand, all in Iberia; Outside Island, Vermilion Block 39 and 76, Vermilion; North Welsh, Jefferson Davis; Ship Shoal Block 28 and Turtle Bayou, Terrebonne; and West Cameron Blocks 33, 45, and 149, Cameron.

Michigan.—G. E. Eddy, State geologist, Michigan Department of Conservation, reports that in 1949 38 new gas wells were completed and 54 facility wells were drilled in gas-storage fields. The total number of completions was 16 less than in the previous year.

Eight new fields were discovered during the year, although only the Isabella field in Isabella County promises to be significant. The State geologist reports that the Howell field produced 3,971 million cubic feet, about 27 percent of the State's total 1949 production of 14,500 million cubic feet. The reported 1948 production was 21,370 million cubic feet.

A large increase in the consumption of natural gas in Michigan was made possible in 1949 by completion of the Michigan-Wisconsin pipeline from the Southwest.

Mississippi.—The number of gas wells completed declined from 16 in 1948 to 5 in 1949. One wildcat was brought in in Marian County; three development wells were completed in the Baxterville field and one in the Hub field. H. M. Morse, supervisor, Mississippi State Oil and Gas Board, reports that delivery of natural gas to pipelines was

62,979 million cubic feet in 1949, almost double that of 1948. Over 70 percent of the gas, 44,460 million cubic feet, originated in the Gwinville field. The Baxterville field supplied 4,682 million; the Carthage field, 5,982 million; the Soso field, 6,420 million; the Sandy Hook field, 87 million; the Hub field, 879 million; the Jackson field, 289 million; and the Fayette field, 180 million cubic feet. No pipeline facilities were available at the Rodney, Sherron, Roxie, and McBride fields.

Missouri.—Frank C. Greene, district geologist, Missouri Division of Geological Survey and Water Resources, reported that five gas wells were completed in Missouri in 1949. Three of these wells were near Lisle, Cass County, and had a reported initial open flow of 2 million cubic feet per day. Two wells south of Harrisonville, Cass County, were brought in with an initial open flow of 370 thousand cubic feet per day.

Production of natural gas decreased from 31 million cubic feet in 1948 to 23 million in 1949.

Montana.—J. R. Schwabrow, Federal Geological Survey, reports a total of 65 gas-well completions with a combined open flow of 152 million cubic feet per day in Montana in 1949. Only one wildcat well was of commercial size. This was the Devil's Pocket well (Pet anticline), which had an initial flow of 32 million cubic feet per day.

Gas utilization is still limited by distribution facilities. A 6-inch pipeline was laid from the Telstad compressor station to the Utopia field, which started production in December. The sweetening plant under construction in the Cut Bank field was completed and began processing gas from Cut Bank and Reagan fields on October 25. Eastern Montana will receive gas from a pipeline under construction from the Worland field in Wyoming. Net production of natural gas in 1949 was reported to be 41,200 million cubic feet of which 1,400 million was loss. The corresponding 1948 figures were 40,200 million and 1,800 million.

New Mexico.—Information received from Foster Morell, Federal Geological Survey, indicates that two gas fields were discovered in the San Juan Basin of northwest New Mexico in 1949. These were the La Plata (three wells) and the Gavilan (one well) fields. The importance of these fields is still undetermined. Seventeen other wells were completed in the San Juan Basin, 14 of which were in the Fulcher Basin-Kutz Canyon field.

In northwestern New Mexico dry-gas deliveries to all residential, commercial, and industrial consumers rose to 11,544 million cubic feet from 9,300 million in 1948.

In southeastern New Mexico 47 gas wells were completed in Lea County compared with 35 in 1948. No major discoveries in this region and no gas completions in Eddy County were reported for 1949.

Production of gas in southeastern New Mexico declined from 207,852 million cubic feet in 1948 to an estimated 202,687 million in 1949. This production consisted of 37,150 million cubic feet of dry gas and 165,537 million of casinghead gas. Of this quantity, 170,011 million cubic feet were marketed.

In central New Mexico no gas wells were completed in 1949. Production of natural carbon dioxide from the Bueyeros field, Harding County, increased to 87 million cubic feet from 73 million in 1948.

New York.—W. L. Kreidler, senior geologist, New York Geological Survey, reported that production of natural gas in 1949 had declined to about 3,500 million cubic feet from 4,500 million in 1948. Twenty-five wells were drilled into the Medina and 10 wells into the Oriskany formations, but none resulted in commercial production. Four facility wells were drilled in gas-storage fields.

North Dakota.—Wilson M. Laird, State geologist of the North Dakota Geological Survey, reported that 26 wells were producing gas in the State in 1949, one more than in 1948, and that no permits had been issued for gas-well drilling during the year. The production of gas decreased to 529 million cubic feet in 1949 from 643 million cubic feet in 1948.

Ohio.—A summary of Ohio oil and gas activities prepared by R. L. Alkire of the Ohio Geological Survey states that the number of gas completions and average open flow per well declined in 1949 as compared to 1948. The number of gas wells completed declined from 493 (revised figure) to 292. Of these, 138 produced from the Clinton group and 73 in the Berea. The average initial open-flow capacity for all new gas wells was 676 thousand cubic feet per day; however, the average flow from those wells in the Clinton was 1,146 thousand.

The largest gas well brought in was in section 15, Brush Creek Township, Muskingum County. The initial open flow was 10.4 million cubic feet per day from the Clinton sand at 3,886 feet.

Discoveries and extensions to old fields added 51 billion cubic feet to proved reserves. Approximately 4,000 acres of new pools and 7,800 acres of extensions to old fields were proved. Net production for the year was 47,000 million cubic feet, according to the American Gas Association committee on natural-gas reserves.

Oklahoma.—Gas-well completions in 1949 numbered 213, about 40 less than in 1948. Eighty-eight of these were in the Hugoton field. Eleven new gas fields were discovered, four of which were in Hughes County. The most productive discovery well was in the Dustin Southeast field in Hughes County, which tested 15 million cubic feet per day on a ⅜-inch choke.

New gas production in 1949, according to the American Gas Association committee on natural-gas reserves, was 567,335 million cubic feet. In 1948 this committee reported production of 674,315 million cubic feet.

Pennsylvania.—J. G. Montgomery, Jr., vice-president, United Natural Gas Co., reports that 446 gas wells were completed in Pennsylvania in 1949. Of these, 430 produced from Upper Devonian strata and had an initial open flow of 93.4 million cubic feet per day. Three new fields were discovered, although only the one in Indiana County is considered to have commercial significance.

Greatest activity in Oriskany sand drilling was in Potter and Cameron Counties where 13 wells were completed with an initial open flow capacity of 60.5 million cubic feet per day. A well brought in in Westmoreland County from the Oriskany sand is significant in that

it strengthens the possibility of a northeast-southwest trend from Fayette County to Cameron and Potter Counties.

The deepest well in Pennsylvania and the deepest cable-tool well in the world was drilled to 10,312 feet in Fayette County.

Many depleted wells and about 50 new wells were utilized in conjunction with underground storage reservoirs.

The reserves committee of the American Gas Association reports that net natural-gas production in 1949 was 70,000 million cubic feet compared to a corresponding 1948 production of 74,592 million.

South Dakota.—J. R. Schwabrow, Federal Geological Survey, reports there were no natural-gas developments in 1949. An estimated 8 million cubic feet of gas were marketed and 4 million lost from the gas-water wells at Pierre. This was almost unchanged from 1948.

Tennessee.—H. C. Milhous, assistant geologist, Tennessee Department of Conservation, reports that there were no developments in gas production in 1949. Production decreased from 157.5 million cubic feet in 1948 to 137 million in 1949 due to the mild 1949 winter.

Texas.—The production of natural gas in Texas as reported by the Texas Railroad Commission increased 7 percent in 1949 to 3,519,173 million cubic feet, including 798,211 million returned to formation. This increase was predominantly from gas wells. Gas-well completions totaled 746 for the year, of which 112 were wildcats. As usual, the Panhandle had the greatest number of gas-well completions—310 in 1949—more than double the number reported for 1948. In Sherman County alone 112 wells were completed and 1 new field, as yet unnamed, was found.

The majority of the wildcat wells were drilled in the South and Gulf Coast regions. The discovery in south Texas that held the most promise was the Clayton gas-condensate field in western Live Oak County. Production is from the Wilcox formation. The field has been extended 2 miles southwest and 3½ miles northeast of the discovery well.

There were numerous gas discoveries on the Gulf coast, most of them of little importance. The Todd-field discovery in southeast Grimes County was the first commercial production in this county. This, with the nearby gas-condensate discovery in the northeast corner of Waller County and the New Ulm area in Austin County, holds promise for the previously undeveloped strip across the juncture of these counties. A gas well was completed in the Gulf of Mexico, 18 miles off Galveston County, and produced over 5 million cubic feet of gas and about 50 barrels of condensate per day on a ¼-inch choke.

East Texas opened six new gas fields, two in Harrison County. One of these—Woodlawn—had been shut-in since completion of the discovery well in 1947 for lack of market. The other, the North Laning field, is probably the most promising discovery in east Texas in 1949. It produces from the Young zone of the Rodessa formation.

Utah.—J. R. Schwabrow, Federal Geological Survey, reports no natural-gas developments in Utah in 1949. The South Last Chance

area was abandoned. The production of carbon dioxide gas in the Farnham field decreased from 156 million cubic feet in 1948 to 94 million in 1949. Marketed production of natural gas from the Clay Basin field was 6,126 million cubic feet compared with 6,610 million in 1948. In addition, an unreported quantity of gas was produced in 1949 from oil wells in the new Ashley Valley and Roosevelt fields.

West Virginia.—Paul H. Price, state geologist of West Virginia, reported 427 gas completions in the State in 1949. In 1948, 590 gas wells were completed. The initial open-flow gas production of all new wells was 352 million cubic feet per day, an average flow per well of 824 thousand cubic feet daily. The greatest number of new producing gas wells was reported in Wayne, Lincoln, Wyoming, and Raleigh Counties.

Net gas production as reported by the American Gas Association, reserves committee, was 180,000 million cubic feet in 1949, a decline of 26,000 million from 1948.

Wyoming.—J. R. Schwabrow, Federal Geological Survey, reports that 10 gas wells were completed in Wyoming in 1949, which had a combined open flow of 135 million cubic feet per day. One new field was found at Salt Wells, south of Baxter. The discovery well's open-flow production is estimated at 10 million cubic feet per day from the Dakota formation.

Plant construction was among the year's most important developments. A 12-million-cubic-feet-per-day combination gasoline and sulfur-extraction plant in the Elk Basin field began operation. At the Worland field a natural-gasoline plant and a sulfur-extraction plant were nearing completion at the end of the year. These will treat 30 million cubic feet of sour gas per day. The residue gas will be transported via pipeline to eastern Montana. These plants will be significant in reducing the waste of sour gas in the State, two-thirds of which occurred in the Worland field. Net production according to the report increased from 61 billion cubic feet in 1948 to 72 billion in 1949.

INTERSTATE SHIPMENTS AND EXPORTS

The interstate shipment of natural gas continued as the most rapidly growing activity of the industry. Shipments increased by 25 percent in 1948 to 1,756,629 million cubic feet. This is the largest increase yet recorded in a single year. Texas again produced the largest quantity of gas for interstate shipments, followed by Louisiana and Oklahoma. Kansas, which ranked fourth in gross exports, imported 155 billion cubic feet in 1948. Thus on a net basis it is little more than self-sufficient in natural gas.

The importing States, in the order of their gross receipts in billions of cubic feet, were Ohio, 201; Illinois, 161; Kansas, 155; and Pennsylvania, 142.

Exports to Mexico increased from 17,942 million cubic feet in 1947 to 18,511 million in 1948. Exports to Canada decreased from 207 million cubic feet in 1947 to 193 million in 1948.

Interstate transportation of natural gas in 1948 [1]

[1] Includes:
Exports to Canada—193 million cubic feet.
Exports to Mexico—18,511 million cubic feet.
[2] Includes gas stored and lost in transmission.

PIPELINES

Pipeline construction in 1949 proceeded unhampered, except by some scarcity of large-diameter pipe. The Federal Power Commission in 1949 issued 91 certificates of public convenience and necessity authorizing 7,537 miles of pipeline estimated to cost $570,408,000 and to increase delivery capacity of the lines by over 1 trillion cubic feet per year. This compares with 1948 authorizations estimated to cost $424,598,000 and to increase the delivery capacity of natural-gas pipelines by over 500 billion cubic feet per year. Still pending before the Commission are applications for construction that would add another 1.7 trillion cubic feet per year to this capacity.

Among the largest pipeline projects authorized in 1949 is the 20- to 26-inch line to be built by Tennessee Gas Transmission Co. from northeastern Kentucky to the Buffalo, N. Y., area. In all, over 100 cities of greater than 50,000 population will benefit by projects authorized in 1949.

CONSUMPTION

Consumption of natural gas increased to 4,945,000 million cubic feet in 1948 from 4,426,000 million in 1947. The increase was divided almost equally percentagewise between domestic, 12-percent increase;

Natural gas consumed in the United States, 1944–48

commercial,[2] 13-percent increase; and industrial users, 12-percent increase. Approximately 75 percent of all marketed natural gas was used by industrial consumers. The three largest consuming States were again Texas, using 32 percent; California, 12 percent; and Louisiana, 9 percent.

Treated for Natural Gasoline.—The quantity of natural gas processed at natural-gasoline and cycle plants increased 8 percent in 1948 to 4,394,000 million cubic feet. Texas remained the largest processor while Louisiana, New Mexico, and Oklahoma showed large percentage increases. Reductions in the volume of gas treated took place in Illinois, Michigan, Ohio, and Pennsylvania. Colorado began processing gas for the first time in 1948.

The ratio of gas treated to gas consumed declined from 0.92 in 1947 to 0.89 in 1948.

[2] "Commercial" uses comprise stores, hotels, theaters, etc.

Natural gas treated at natural-gasoline and cycle plants in the United States, 1944–48, by States, in million cubic feet

Ratio to total consumption	.89	.94	.91	.92	.89

[1] Partly estimated.

Domestic and Commercial.—Domestic consumption of natural gas increased 94,000 million cubic feet in 1948 to 896,000 million cubic feet. The number of domestic consumers increased by about 1,300,000 to 13,508,000. The increase in the number of consumers was greatest in Pennsylvania—512,000. This was due mainly to the initiation of deliveries of natural gas to the Philadelphia area by the Texas Eastern Transmission Corp. through the "big-inch" and "little-inch" pipelines. These consumers are not new users of gas but now use natural gas mixed with manufactured gas. The quantity of natural gas delivered to these consumers in 1948 was small, as deliveries did not begin until September.

California showed the largest increase in the volume of gas consumed by domestic installations—23,000 million cubic feet. This State also had the second-largest increase in number of consumers—149,600. These increases were made possible by completion of the Texas–California transmission line.

Commercial consumption of natural gas rose to 323,000 million cubic feet, and the number of consumers increased 106,000 to 1,145,000. Statewise the increases followed the same pattern as domestic consumption. Average consumption per meter increased from 274,000 cubic feet to 282,000.

Field.—Field use of natural gas increased 9 percent to 1,022,000 million cubic feet. In the post-World War II years, field use has, year by year, become a smaller percentage of marketed production, decreasing from 23 percent in 1945 to 20 percent in 1948 in spite of the increased field consumption entailed in gasoline-plant and cycle-plant operation. This trend probably reflects the more prudent use of natural gas in many fields as its value increased.

Carbon-Black Manufacture.—The consumption of natural gas in the manufacture of carbon black decreased in 1948 by 1 percent to 481,000 million cubic feet, the first decline since 1943. Declines took place in all reported States except New Mexico. The continued increase in consumption there can be attributed to the low average value of gas—

Domestic and commercial consumption of natural gas in the United States in 1948, by States [1]

[1] Federal Power Commission. These figures include some manufactured gas and are therefore shown separately. The natural gas component in these figures is included with "Other Industrial."

[2] Gas used in portland-cement plants included under "Unclassified by States," for United States total and under "Other industrial" for State total to avoid disclosing figures of individual operators.

[3] Gas used in carbon-black manufacture included under "Unclassified by States' for United States total and under "Other industrial" for State total to avoid disclosing figures of individual operators.

[4] Less than 500 M cubic feet.

3.7 cents per thousand cubic feet. The national average value of gas consumed by carbon-black plants in 1948 was 4.7 cents per thousand cubic feet compared with 3.6 cents in 1947. Further details of the carbon-black industry appear in the Carbon Black chapter.

Petroleum Refineries.—The use of natural gas as fuel at petroleum refineries increased 21 percent in 1948 to 441,000 million cubic feet. It continues to increase in importance as a refinery fuel, constituting 34 percent of all such fuel in 1948. Refineries in Texas consume over half of the total amount used, and 85 percent is consumed in Texas, California, and Louisiana.

Electric Public-Utility Power Plants.—Gas consumption by electric public-utility power plants, as reported by the Federal Power Commission, increased in 1948 by 28 percent to 478,000 million cubic feet. A small amount of manufactured gas is included in this figure. Texas and California showed the greatest increases in consumption. Easing of the gas shortage with completion of the Texas-California pipeline made this possible in California. Large gains were also made in Arizona, Illinois, Iowa, Louisiana, and Minnesota. Of the States that used over 1 billion cubic feet per year, only Alabama, Florida, and Tennessee showed decreases.

Portland-Cement Plants.—Production of portland cement in 1948 increased 10 percent, while at the same time the use of natural gas as fuel at these plants increased 19 percent to 72,000 million cubic feet. This reflects the better availability of gas in 1948, as production of portland cement in 1947 increased 14 percent while gas consumption increased only 4 percent.

Other Industrial.—The consumption of natural gas by all industry other than those individually mentioned increased 14 percent to 1,710,000 million cubic feet. The largest increase—60,000 million cubic feet—took place in Texas, followed by Illinois, Oklahoma, and California. Illinois, Indiana, and Missouri, which lost industrial consumption in 1947, more than regained this loss in 1948 as a result of the increased throughputs of the Panhandle Eastern Pipeline Co. and the Texas Eastern Transmission Co. pipelines. Of the States that lost industrial consumption, Michigan, Wisconsin, and New York will no doubt regain this consumption when transmission lines now under construction to these markets are completed in 1949 and 1950.

The Bureau of the Census published a detailed break-down of fuel consumption by industry for 1947. This census did not include "Carbon-black manfacture," "Electric public-utility power plants," and most of the "Field" uses, which categories are included under "Industrial" by the Bureau of Mines.

Mixed Gas.—The over-all rise in the number of consumers of mixed gas was due to the large gains made in Pennsylvania. Completion of natural-gas lines to Philadelphia resulted in this city's conversion from manufactured gas to mixed gas. The District of Columbia converted from mixed gas to straight natural gas in 1947. Minnesota, Nebraska, and Ohio showed large decreases in the number of mixed-gas consumers. The total volume of mixed gas consumed in 1948 decreased by 9 percent to 114,000 million cubic feet. The quantity of mixed gas consumed usually will increase when natural gas is first made available to a locality and subsequently diminish as the natural gas entirely replaces manufactured gas.

Consumption of natural gas used with manufactured gas in the United States in 1948, by States

State	Domestic		Commercial		Industrial (million cubic feet)	Total	
	Number of consumers	Million cubic feet	Number of consumers	Million cubic feet		Million cubic feet	Value at point of consumption (thousands of dollars)

Total: 1948	2,798,410	70,806	160,430	17,745	25,847	114,398	83,827
1947	2,719,800	83,239	155,320	18,923	22,103	124,265	90,932

PRICES

The average value at wells for natural gas rose in 1948 to 6.5 cents per thousand cubic feet from 6.0 cents per thousand in 1947. The increase in price in Texas was greater than the average—from 3.7 to 4.5 cents per thousand cubic feet. New Mexico still has the lowest wellhead price—2.7 cents per thousand cubic feet. Of the three largest producers in the Southwest—Texas, Oklahoma, and Louisiana—the price of gas in Louisiana at 3.9 cents per thousand cubic feet is now the lowest.

The price of natural gas to domestic consumers declined an average of 0.3 cent per thousand cubic feet to 65.3 cents. The declines were general in all areas except the East and Great Lakes regions.

The average value at point of consumption of gas sold to industry, including petroleum refineries and portland-cement plants, rose from 16.1 cents per thousand cubic feet in 1947 to 17.2 cents in 1948. Large [illegible]

District of Columbia). The increase in Texas nullified the 1947 decline. Price declines in Illinois and Indiana following the 1947 increases indicate the better supply position in these States.

Data on the average values of natural gas at wells and at points of consumption, by individual States and by uses, in 1948 are tabulated in the Marketed Production and in the Consumption sections of this chapter.

TECHNOLOGY

The majority of technical developments within the industry are aimed at alleviating or eliminating the seasonal load variation. The Federal Power Commission has granted one company in the Chicago

area permission to construct a plant to produce and store liquefied natural gas. It will have a storage capacity of 400,000 million cubic feet. Another approach to peak load relief is the standby oil-gas generator. A so-called "push-button" unit is being tested, which will have a short start-up and shut-down time and be able to produce continuously; it will feature silicon carbide cracking tubes permitting higher operating temperatures.

In the appliance industry the peak-load problem is being attacked by the introduction of combination gas-oil burners that would burn gas under normal conditions but could switch to oil during high demand periods.

Improvements in the gas turbine, which is now reported to have a thermal efficiency of 30 percent, have prompted one pipeline operator to order an experimental unit to drive a centrifugal compressor at a pipeline compressor station.

WORLD REVIEW

By comparison, natural-gas utilization outside the United States is very small. Large producing fields have usually been in sparsely populated regions. Austria, Czechoslovakia, Hungary, Poland, Rumania, and the U. S. S. R. have for many years marketed natural gas. The U. S. S. R. is reported to have recently completed several transmission pipelines. News of recent developments in these countries is very sketchy. Germany has only one producing gas field, Bentheim. Its production is consumed by a chemical plant. Great Britain's small production, too, is used industrially. The South American oil-producing countries have made local use of their natural gas for both domestic and industrial purposes.

With the proved practicality of long-distance pipeline transmission, interest is growing in foreign countries in more extensive marketing of natural gas.

Argentina.—Natural gas consumption in Argentina in 1948 was 8.2 billion cubic feet, an increase of 23 percent over the previous year. In September of 1949 construction was completed on an 1,100-mile, 10-inch line from the Comodoro Rivadavia fields to Buenos Aires. Plans have been made to tie the Plaza Huincul fields into this line by constructing a 500-mile, 8-inch line to General Conesa.

Canada.—Production of natural gas in Canada in 1949 was 74.9 billion cubic feet, 78 percent over 1948. Nearly 90 percent of this was produced in Alberta Province. Gas reserves of Alberta were estimated to be about 4 trillion cubic feet at the end of 1948. This estimate did not include the considerable reserves of the Pincher Creek field. Several proposals have been made for pipelines to transport gas to other Provinces and to the Pacific Northwest States. No authorizations will be granted until the Provincial Government is convinced that the future requirements of Alberta will not be jeopardized by such exports.

France.—In 1949 France completed a 114-mile pipeline from Toulouse to Bordeaux to supply 12 million cubic feet of gas per day from the St. Marcet field.

Consumption of natural gas, by countries, 1940 and 1944–48, in million cubic meters

[1] Preliminary figures.
[2] Data not available.
[3] Less than 500.000 cubic meters.
[4] American-British Zones.
[5] Beginning 1945, industries under control of National Resources Commission.
[6] Excluding USSR, where natural-gas consumption was last reported as 1,400 million cubic meters in 1936.

Japan.—Since the end of World War II, Japan has developed the gas resources on the Chiba Peninsula near Tokyo. Proved reserves at the end of 1949 were 560 billion cubic feet. The operators of the field hope to construct a 12-inch pipeline to Tokyo to supply this and neighboring cities with 10 million cubic feet of gas per day. The fuel shortage in Japan has been so acute that compressed natural gas is being used as motorcar fuel.

Mexico.—In 1949 Mexico produced about 41 billion cubic feet of natural gas. Over 75 percent of this was produced in the Tuxpan area. Recent discoveries in the northeastern part of the country in the Reynasa, Cana, Brazil, and 18 de Marzo fields promise to hold larger gas reserves than have been proved anywhere in the country. It is possible that production from these fields may supplant gas now being exported from Texas for use in the Monterrey area of Mexico.

A 20-inch pipeline was completed in 1949 from Poza Rica to Mexico City. The gas will be entirely for industrial use. Pipelines from Monterrey to Torreon and from Reynasa to Mexico City are in the planning stages.

Natural Gasoline

and Liquefied Petroleum Gases[1]

By G. W. Cale, E. M. Seeley, A. T. Coumbe, and I. F. Avery

GENERAL SUMMARY

COMBINED production of natural-gas liquids in 1949 totaled 6,561 million gallons, an increase of 6 percent over the preceding year and another record. The gain was maintained consistently throughout the year, as each quarter recorded an increment over the comparable 1948 quarter.

The average yield of all light products was 1.39 gallons per thousand cubic feet of gas processed in 1949, a slight decrease from the preceding year. The yield of natural gasoline dropped to 0.64 gallon, and the recovery of LP-gases[2] was 0.51 gallon per thousand cubic feet. The production of propane gained 12 percent and butane 31 percent compared with 1948. Natural gasoline continued to be the most valuable of all products processed; LP-gases held second place, and other products were last.

Notwithstanding a 46-percent reduction in the total number of plants during the past 20 years, the over-all plant capacity has nearly trebled during this period. The industry has followed an expansion program which included enlarging existing facilities during 1949, resulting in a tremendous increase in capacity, especially at cycle plants. The total daily capacity of all natural-gasoline plants totaled 20.6 million gallons and cycle plants 6.6 million gallons.

The trend toward extraction of higher propane yields has been accelerated by installation of refrigeration and other equipment in many plants.

A new development that may have far-reaching significance in future is the underground storage of surplus LP-gases during the summer months. This practice has now advanced beyond the experimental stage, and several companies have utilized salt-water sands in storing surplus products. This procedure assures an adequate supply of LP-gases during the winter months and in addition acts as a conservation program, as it is unnecessary to burn excess products during the slack season. Another benefit is the large saving effected in utilizing underground storage rather than erecting specially designed pressure storage tanks.

Noteworthy is the recent development of upgrading the cycle-plant gasoline octane number at central plants and increasing the volume of finished gasoline and naphtha processed at the plants. Of special interest is the report that some cycle plants have already installed small catalytic reformer units to manufacture finished motor fuel.

The total demand for natural-gas liquids processed at natural-gasoline and cycle plants was 6,706 million gallons, an increase of 6.7 per-

[1] Preliminary figures.
[2] Liquefied refinery gases.

cent compared with 1948. Shipments of light hydrocarbons to refineries totaled 3,765 million gallons, equivalent to 56 percent of the total demand in 1949, compared with 59 percent in 1948. It is evident that the sales of light liquid products to refineries are becoming less important each year, relative to total output of the industry.

Sales of natural gasoline to jobbers and other trade outlets increased 6 percent in 1949 compared with the previous year, while sales of finished gasoline and naphtha rose 36 percent. Stocks of light hydrocarbons were 287 million gallons at the year's end, a 22-percent increase over the closing inventory of 1948.

The total value of all natural-gas liquids at plants declined to $372,150,000 in 1949, a drop of 19 percent compared with the preceding year. This monetary loss was directly attributable to the sharp break in the market as evidenced by lower prices for products in all areas. The average value declined from 7.4 cents per gallon in 1948 to 5.7 cents in 1949. The average price of 26–70 natural gasoline in 1949 was 5.8948 cents per gallon f. o. b. group 3 basis, a decline of 31 percent from the preceding year. Likewise, the average price of this product f. o. b. Breckenridge dropped 33 percent. A break occurred in LP-gas prices throughout the country in 1949 because a surplus of this material was made available in the principal consuming areas. The drop was unusually severe in the New York Harbor area, where the average price for commercial propane decreased 2.5 cents per gallon.

Export shipments totaled 237 million gallons, a gain of 21 million gallons compared with 1948. The largest importer of United States natural gasoline was Canada, while the United Kingdom was second and the Netherlands Antilles third. Canada also led in LP-gas imports, Mexico took second place, and Brazil was next in importance.

RESERVES

Reserves of natural-gas liquids totaled 3,729,012,000 barrels as of December 31, 1949, according to a report of the American Gas Association and the American Petroleum Institute. This estimate includes condensate, natural gasoline, and LP-gases and represents an increase of 188,229,000 barrels over 1948.

Estimated proved recoverable reserves of natural-gas liquids [1] in the United States, 1948–49, in thousands of barrels

Total	3,540,783	294,211	92,565	198,547	2,104,620	630,791	993,601	3,729,012

[1] Comprises natural gasoline, LP-gases, and condensate.
[2] Not allocated by types, but occurring principally in column shown.

Largest increases in reserves were reported by the following States (in millions of barrels): Louisiana 72, Texas 69, Oklahoma 34, California 12, Wyoming 8, and New Mexico 5. States reporting the biggest declines were: Colorado 12, West Virginia 2, and Kentucky and Mississippi 1 each.

Estimated reserves of natural gas were 180,381,344 million cubic feet on December 31, 1949, an increase of 6,512,004 million cubic feet compared with reserves on December 31, 1948. The comparable reserves of 3,729,012,000 barrels of natural-gas liquids would therefore indicate an average yield of 0.87 gallon per thousand cubic feet of gas reserves.

PRODUCTION

Production of natural gasoline and allied products continued to shatter all previous records, with an output of 6,560,546 thousand gallons—a 6-percent increment over 1948. Commencing in January 1949 and continuing throughout the year, production of light hydrocarbons each month surpassed the output of the comparable 1948 month.

The 1949 production of natural gasoline totaled 3,007,528 thousand gallons, a 1-percent increase over the preceding year, whereas LP-gases gained over 9 percent, with a production of 2,418,436 thousand gallons. The largest increase was made by finished gasoline and other light products, with an output of 1,134,582 thousand gallons, a gain of almost 17 percent in comparison with 1948.

Texas produced almost 50 percent of the Nation's output of light products in 1949, while California was second with 17 percent and Louisiana third with 12 percent.

[2] A producer operating in more than 1 State is counted but once in arriving at total for United States.
[3] Preliminary figures.

REVIEW BY STATES

California.—In California production of all light products totaled 1,137,461 thousand gallons in 1949, an increase of 2 percent over the preceding year. Output of natural gasoline gained 3.5 percent, while LP-gases increased 2 percent in contrast with 1948.

Louisiana.—The total production of light hydrocarbons in 1949 was 763,898 thousand gallons, which represented an increment of 8 percent in comparison with the previous year's production. Output of natural gasoline declined approximately 1 percent but production of LP-gases gained 12 percent, and finished gasoline and naphtha rose 37 percent. Production of light products in the Gulf Coast area continued to decline moderately, but output in Louisiana Inland gained 16 percent compared with 1948.

Oklahoma.—The combined production of natural-gas liquids continued the upward trend of recent years increasing 13 percent to a record output of 529,939 thousand gallons in 1949. Finished gasoline and naphtha jumped 79 percent, while LP-gases rose 22 percent and natural gasoline increased 5 percent in 1949.

[1] Preliminary figures.

Texas.—Production of light hydrocarbons in 1949 continued to shatter all former records when a total of 3,240,014 thousand gallons was recovered, a gain of 7 percent compared to the preceding year. The Texas output for the year represented approximately 50 percent of the Nation's entire production. Finished gasoline and naphtha increased 24 percent, LP-gases were up 8 percent, and natural gasoline declined 1.4 percent in 1949 compared with 1948.

Other States.—Outstanding was Colorado's greatly increased output of light liquids in 1949 over the previous year. Significant gains were recorded by Michigan, Montana, and New Mexico, while smaller increases were registered by Kansas, Kentucky, Mississippi, and West Virginia. Arkansas production remained virtually unchanged compared with 1948, whereas that of Illinois, New York, Ohio, Pennsylvania, and Wyoming decreased.

YIELDS, PROCESSES, AND NUMBER OF PLANTS

Cycle Plants.—Approximately 1,783,087 thousand gallons of light hydrocarbons were recovered at cycle plants in 1949 from 1,150,000,000 thousand cubic feet of natural gas—an indicated yield of 1.55 gallons per thousand cubic feet. This compares with 1.60 gallons per thousand cubic feet in 1948 and 1947.

Yields.—The average yield of all light products decreased slightly in 1949 compared with the preceding year. The yield in 1949 was 1.39 gallons per thousand cubic feet of gas processed as against 1.40 gallons the previous year. The yield of natural gasoline declined to 0.64 gallon per thousand cubic feet in 1949 from 0.68 gallon in 1948. The average yield of LP-gases during the year increased slightly to 0.51 gallon per thousand cubic feet compared with 0.50 gallon in 1948.

Propane production exceeded all former records, with an output of 874,708 thousand gallons, a gain of 12 percent over 1948.

The production of butane increased 31 percent in 1949 contrasted with the preceding year, but a moderate loss was reported in the output of commercial butane-propane mixtures.

The average value of natural-gas liquids recovered per 1,000 cubic feet of natural gas declined to 7.9 cents per gallon in 1949 as against 10.4 cents per gallon in 1948. The decrease resulted from a sharp break in the market for these products. Natural gasoline maintained its position as the most valuable of all products recovered, contributing 4.1 cents per 1,000 cubic feet of gas processed. LP-gases were valued at 2.1 cents and other products at 1.7 cents. Comparable amounts in 1948 were 5.9 cents, 2.7 cents, and 1.9 cents per 1,000 cubic feet of gas processed.

Production by Processes.—A gain of 2 plants was reported in 1948, when natural-gasoline and cycle plants numbered 548. The number of compression-type plants continued to decline, dropping from 135 in 1947 to 131 in 1948, but absorption plants increased from 373 to 376. Moreover, cycle plants gained 3 in number—from 38 to 41. An interesting fact is that, notwithstanding a 46-percent reduction in the total number of plants during the past 20 years, the over-all plant capacity has nearly trebled during this period.

A definite trend toward expansion of existing cycle plants is evidenced by construction completed during 1949. A typical example is the La Gloria Corp. plant, Falfurrias, Tex., where a large addition was constructed and designated the "casinghead-gasoline plant." Although it is adjacent to the cycle plant, it is operated as a separate plant, producing only raw, unfractionated natural gasoline.

Indicative of present-day technique is the Sun Oil Co. cycle plant, Star County, Tex., where all natural gas is completely utilized. Five oil fields are served by the plant, and in one instance casinghead gas is piped 26 miles to the plant. Although no one field can supply enough gas to warrant erection of this cycle plant, the combined gas capacity of the 5 fields—35 million cubic feet daily—was ample to justify construction of such facilities.

Natural gasoline and allied products produced in the United States in 1948, by States and by methods of manufacture [1]

[1] Figures for 1949 not yet available.
[2] Includes 20 plants manufacturing LP-gases.
[3] Includes combination of absorption process with compression and charcoal processes. Includes 230 plants manufacturing LP-gases; and 3 charcoal plants in West Virginia and Ohio with 1,664,000 gallons produced in 1948 and 3 charcoal plants with 1,586,000 gallons in 1947.
[4] Includes 32 plants manufacturing LP-gases.
[5] Includes 35,070,000 gallons of field condensate.
[6] Drip gasoline.

MARKET DEMAND—SHIPMENTS

The total demand for natural-gas liquids processed at natural-gasoline and cycle plants was 6,706,096 thousand gallons—a new record and an increase of 7 percent over the 1948 peak. Deliveries of natural gasoline showed a slight increase of less than 1 percent, but LP-gases gained 9 percent in 1949 over the previous year. Shipments of condensate declined 2 percent, but those of finished gasoline and naphtha rose sharply, gaining 25 percent. The figures for LP-gases in the adjacent table do not include LR-gases produced at petroleum refineries.

Shipments to Refineries.—Shipments of natural-gas liquids to refineries totaled 3,764,960 thousand gallons, which represented 56 percent of the total demand in 1949. A definite pattern has been established during recent years, clearly indicating the declining relative importance of sales of light liquids to refineries. A slight gain (0.5 percent) was registered by natural-gasoline shipments to refineries during 1949, when 2,770,418 thousand gallons were received. Shipments of LP-gases to refineries totaled 513,162 thousand gallons, a 19-percent gain contrasted with 1948. Condensate shipments dropped 1.9 percent when only 338,929 thousand gallons were shipped to refineries.

Normal butane shipments to refineries in 1949 increased 97 percent, while isopentane dropped 10 percent and isobutane 18 percent compared with the preceding year.

Supply and distribution at plants of natural gasoline and allied products in the United States, 1948–49, by months, in thousands of gallons

[1] Preliminary figures.

Percentage of natural gasoline and allied products in refinery gasoline in the United States, 1945–49, by districts

Year	East Coast	Appalachian	Indiana, Illinois, Kentucky	Oklahoma, Kansas, Missouri	Texas Inland	Texas Gulf Coast	Louisiana Gulf Coast	Arkansas, Louisiana Inland	Rocky Mountain	California	Total
1945	1.7	1.7	5.8	7.3	20.5	10.9	7.5	19.3	6.9	14.2	9.1
1946	1.2	1.9	5.0	7.9	22.7	8.8	5.1	16.6	4.7	15.4	8.4
1947	.8	2.0	5.5	7.7	22.6	8.8	5.3	10.3	3.9	17.4	8.7
1948	.8	2.4	5.0	8.9	25.0	8.3	4.8	7.1	3.8	17.2	8.5
1949 [1]	1.5	2.0	5.3	9.5	27.6	8.5	6.0	7.5	4.5	18.4	9.1

[1] Preliminary figures.

During 1949, 3,589,194 thousand gallons of natural gasoline and allied products were utilized at domestic refineries, a 12-percent increase over the previous year. The percentage of natural gasoline and allied products used in refinery gasoline varies greatly in different parts of the country. For example, in the Texas Inland refining district the light liquids utilized represented 28 percent of the total gasoline output at refineries, in California 18 percent, in Oklahoma-Kansas-Missouri 10 percent, and in Louisiana Gulf Coast 6 percent. The national average was 9.1 percent in 1949, 8.5 percent in 1948, and 8.7 percent in 1947.

"Direct" Sales.—Sales to jobbers and other trade outlets of natural gasoline amounted to 183,554 thousand gallons in 1949, a 6-percent gain over the preceding year. Sales of finished gasoline and naphtha totaled 505,323 thousand gallons, a marked increment of 36 percent contrasted with 1948. LP-gases utilized for fuel rose again, reaching 1,635,120 thousand gallons, an increase of 7.5 percent, illustrating the heavy demand for this product. However, shipments of LP-gases from the natural-gasoline plants to chemical plants in 1949 revealed virtually no change from the previous year, totaling 285,314 thousand gallons. Noteworthy is the unprecedented demand for finished gasoline and naphtha by jobbers and other market outlets.

SALES OF LP-GASES [3]

A large gain in market requirements for LP-gases, evident in recent years, failed to repeat in 1949, when sales of 2,836,599,000 gallons were only about 4 percent over the 1948 total of 2,736,801,000. The increase of 100 million gallons in sales of LP-gas in 1949 over the 1948 total is less than a fifth of the volume expansion in deliveries reported for 1948. Nominal gains in market requirements were reported for most areas in 1949 except for district 3, where sales remained at about the same level as in the previous year, and district 5, where the 1949 total was 4 percent below the 1948 demand. Exports of LP-gas declined in 1948, according to the United States Department of Commerce. However, an upward trend was again evident in 1949, when overseas shipments were 53,383,000 gallons, a gain of 17 percent over the 1948 total of 45,520,000 gallons.

[3] The survey covering sales of LP-gases in the Pacific Coast marketing area (district 5) was made by E. T. Knudsen, supervising economist. Bureau of Mines, Los Angeles, Calif.

The pronounced shift to a greater relative use of propane, evident in recent years, was repeated in 1949, when sales of 1,403,359,000 gallons were 10 percent over the 1948 total of 1,279,744,000 and made up about one-half of all deliveries compared with a 47-percent share in 1948. Requirements for butane declined 5 percent from 512,615,000 gallons in 1948 to 488,801,000 in 1949, and the relative part of the market for this gas dropped from 19 percent of the total in 1948 to 17 percent in 1949. There was virtually no change in the volume reported for butane-propane mixtures (944,439,000 gallons in 1949 compared with 944,442,000 in 1948) while the relative proportion for these mixtures declined from about 35 percent of total sales in 1948 to 33 percent in 1949. Propane reported for domestic (household) and commercial use, gas manufacturing, chemical raw material, internal-combustion-engine fuel, and miscellaneous uses all showed gains in 1949 over 1948, while quantities indicated for industrial fuel and synthetic rubber components were lower. More butane was sold for domestic consumption and miscellaneous uses in 1949 than in 1948; however, all other uses declined. Gains in sales of butane-propane mixtures for domestic fuel and chemical raw material in 1949 were completely offset by lower demands for other principal uses.

Sales of LP-gases in the United States, 1945–49

Year	Butane		Propane		Butane-propane mixture		Total	
	Thousand gallons	Percent of total	Thousand gallons	Percent of total	Thousand gallons	Percent of total	Thousand gallons	Increase over previous year, percent

[1] Included in "Other uses."
[2] Revised figure.

The reporting of LP-gas sales by marketing districts, initiated in 1948, was repeated in 1949, so demand in the several areas for the 2 years can be compared. Sales in district 3 increased slightly from 1,122,870,000 gallons in 1948 to 1,123,349,000 in 1949, and the quantities represented about 40 percent of the national total for both years.

The market for LP-gas in district 2 rose by 9 percent from 788,142,000 gallons in 1948 to 855,816,000 in 1949, and the relative share for the area was 29 percent of total deliveries in 1948 and 30 percent in 1949. Distributors in district 1 reported about 17 percent of the LP-gas sales in both years, and the volume rose by 8 percent from 454,555,000 gallons in 1948 to 491,753,000 in 1949. The only market to show a decline in sales was district 5, where requirements dropped from 325,307,000 gallons in 1948 (12 percent of all sales) to 312,014,000 in 1949 (11 percent of the national market). Less than 2 percent of the LP-gas is credited to district 4; however, sales in that area increased from 45,927,000 gallons in 1948 to 53,667,000 in 1949—a gain of 17 percent.

[1] The States in each district are as follows:
DISTRICT 1.—Maine, New Hampshire, Vermont, Massachusetts, Rhode Island, Connecticut, New York, New Jersey, Pennsylvania, Delaware, Maryland, District of Columbia, Virginia, West Virginia, North Carolina, South Carolina, Georgia, Florida.
DISTRICT 2.—North Dakota, South Dakota, Minnesota, Nebraska, Iowa, Wisconsin, Illinois, Indiana, Michigan, Ohio, Kentucky, Tennessee, Missouri, Kansas, Oklahoma.
DISTRICT 3.—New Mexico, Texas, Arkansas, Louisiana, Mississippi, Alabama.
DISTRICT 4.—Idaho, Montana, Wyoming, Utah, Colorado.
DISTRICT 5.—California, Oregon, Washington, Arizona, Nevada.
[2] Less than 0.5 percent.
[3] Revised figure.

Domestic (Household) and Commercial Uses.—Sales of LP-gas for domestic and commercial consumption did not show the large relative increase in 1949 as in recent years, when deliveries of 1,627,550,000 gallons were only 10 percent over the 1948 total of 1,473,289,000 gallons in contrast to gains of 28 percent in 1948 and 52 percent in 1947. More than half (52 percent) of the LP-gas sold for domestic use is propane, and the 1949 quantity (854,456,000 gallons) was about 12 percent over the 1948 total. Butane-propane mixtures are also widely used in some areas for domestic fuel; however, the 1949 total (618,495,000 gallons) was only 4 percent above the 1948 demand, and their proportionate share of the market dropped from 40 percent in 1948 to 38 percent in 1949. Relatively little butane is sold for household fuel purposes; however, the quantity reported—154,499,000 gallons—was about 37 percent over 1948 requirements.

There was very little change in the relative proportions of LP-gas sold for domestic fuel in the several marketing areas in 1949 compared with 1948. Sales reported for district 3 declined from about 37 percent of the national total in 1948 to 35 percent in 1949, while there were slight gains in districts 1 and 2. District 2 was credited with 31 percent of all deliveries for domestic fuel in 1948 and 32 percent in 1949, while 17 percent of the total was reported for district 1—a small gain over 1948. Distributors in districts 4 and 5 reported about 3 and 12 percent, respectively, of the domestic item for both years under review.

Gas-Manufacturing Plant Use.—There was little change in the quantity of LP-gas sold to gas-manufacturing plants for use as an enriching agent and for direct distribution through their mains in 1949, as the total 239,210,000 gallons was less than 1 percent above 1948 requirements (237,638,000 gallons). Propane sold for these purposes increased 9 percent in 1949, while the butane total was lower by 3 percent and mixtures were down sharply—20 percent—for the year. Propane delivered to manufactured-gas companies represented 61 percent of their requirements in 1949 compared with a 56-percent share in 1948. The butane in the total declined from 27 percent in 1948 to 26 percent in 1949, while butane-propane mixtures shrank from 17 percent of the manufactured-gas-company item in 1948 to 14 percent in 1949.

More than half (54 percent for both 1948 and 1949) of the LP-gases sold to manufactured-gas companies was reported for district 2, while an additional 30 percent was credited to district 1. About 12 percent of the national total is delivered to gas companies in the Pacific Coast area or district 5, while only relatively small amounts are used in other areas.

Industrial-Plant Use.—LP-gases sold to industrial plants for fuel and other uses declined from a revised total of 180,518,000 gallons in 1948 to 162,197,000 in 1949—a 10-percent shrinkage. The propane in the 1949 total—99,736,000 gallons—was only about 1 percent below the 1948 quantity, but the butane—43,343,000 gallons in 1949—and the mixture—19,118,000 gallons in 1949—were 20 and 25 percent, respectively, under 1948 requirements. The propane share of the LP-gases sold to industrial plants increased from 56 percent of the total in 1948 to 61 percent in 1949, while the butane was down from 30 percent of the 1948 item to 27 percent in 1949. Mixtures represented 14 percent of these deliveries in 1948 and only 12 percent in 1949.

The larger share of the LP-gas sold to industrial plants was reported from district 2, and the proportion for the area increased from 51 percent of the total in 1948 to 53 percent in 1949. Another 31 percent was credited to district 1, while only relative small amounts of this industrial fuel were delivered in remaining areas, with the possible exception of district 5, where the demand dropped from 15 percent of the national total in 1948 to 10 percent in 1949.

Synthetic Rubber Components.—The sharp drop in the manufacture of synthetic rubber in 1949 was reflected in the lower demand for LP-gas used as raw material, as the total of 177,850,000 gallons was about 21 percent below 1948 requirements (225,641,000 gallons). Butane is mostly used to make synthetic rubber, and the sales of this gas for the purpose declined by 20 percent from 194,777,000 gallons in 1948 to 156,607,000 in 1949. Relatively smaller amounts of mixtures—26,739,000 gallons in 1948 and 19,863,000 in 1949—and propane—4,125,000 gallons in 1948 and 1,380,000 in 1949—are also sold for the manufacture of synthetic rubber.

Over four-fifths of the LP-gases delivered for synthetic rubber components were reported from district 3, where most of the manufacturing plants are situated.

Raw Material and Solvents for Chemical Plants.—LP-gas sold to chemical plants showed a nominal increase (4 percent) from a revised total

of 524,350,000 gallons in 1948 to 544,886,000 in 1949. About half the LP-gas delivered for chemical raw material is reported as propane, and the quantity increased 6 percent from 261,327,000 gallons in 1948 to 277,045,000 in 1949. Butane-propane mixtures constituted over a third of the total (38 percent in 1948 and 39 percent in 1949), and deliveries of these to chemical plants were 211,365,000 gallons in 1949, a gain of 8 percent over the 196,571,000 gallons in 1948. Only relatively small amounts of butane are used as chemical raw material, and the demand declined from 66,452,000 gallons in 1948 to 56,476,000 in 1949.

Most of the chemical plants using LP-gas for raw material and solvents are in district 3, and the quantities sold in that area represented 68 percent of the total for both 1948 and 1949. Relatively smaller amounts were credited to district 1—16 percent of the total in 1949—and to district 2—10 percent of all such deliveries for the same year. Sales of LP-gas to chemical plants in district 5 dropped from 9 percent of the total in 1948 to 7 percent in 1949.

Internal-Combustion-Engine Fuel.—LP-gas sold for engine fuel declined from 92,941,000 gallons in 1948 to 77,981,000 in 1949. It is believed that at least part of this large indicated shrinkage in demand is due to some overreporting in 1948. The quantities of butane and butane-propane mixtures sold for internal-combustion-engine fuel both fell in 1949, while the demand for propane showed a large increase. The butane reported in 1949—14,993,000 gallons—was a fourth below the 1948 quantity (20,019,000 gallons), while "mixtures" were down similarly from 58,790,000 gallons in 1948 to 42,724,000 in 1949. Propane used for engine fuel was greater in volume by nearly half—from 14,132,000 gallons in 1948 to 20,264,000 in 1949.

Approximately half of the LP-gas used for internal-combustion-engine fuel was reported from district 2, and sales in that area were down 10 percent. Deliveries in district 5 accounted for about a third of the demand, and there the 1949 quantity was 22 percent below 1948 requirements. District 3 was a market for about one-fifth of this fuel, and dealers there reported sales in 1949 a quarter under the 1948 item. Only minor quantities of LP-gas were sold for engine fuel in districts 1 and 4.

STOCKS

Stocks of light liquids December 31, 1949, totaled 286,888,000 gallons, an increase of 22 percent compared with the previous year. Stocks increased from January to July, when a peak of 322,067,000 gallons was reached; however, the decline was fairly constant during the balance of 1949. Stocks of natural gasoline gained 14 percent and LP-gases increased 12 percent, whereas other products gained 70 percent. Stocks of light products appeared to be adequate to supply the ever-expanding demand.

Stocks of natural gasoline and allied products in the United States, 1945–48, and 1949, by months, in thousands of gallons

PRICES

The average price of 26–70 natural gasoline in 1949 was 5.89 cents per gallon f. o. b. group 3, a sharp drop from the previous year's average price of 8.5 cents per gallon, equivalent to 31 percent. The high price for 1949 was established in January at 8.45 cents per gallon. The market weakened in February and by April the price had declined to 5.07 cents per gallon, the lowest of the year. A slight recovery took place during the fall and winter months, and the price leveled off to 5.88 during October, November, and December.

An identical pattern was followed by this product f. o. b. Breckenridge, Tex., where the average price of 26–70 natural gasoline during 1949 was 5.40 cents per gallon, a 33-percent decrease from the preceding year. High for 1949 was 7.95 cents per gallon in January, while

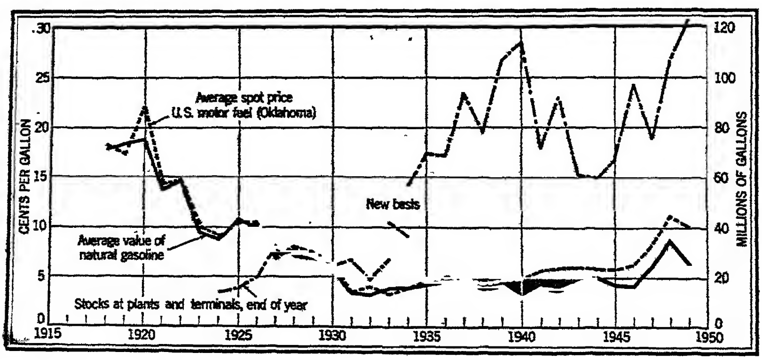

FIGURE 2.—Trends in average value of natural gasoline, spot price of gasoline, and stocks of natural gasoline, 1918–49.

the low was 4.58 cents per gallon in April, with the market strengthening to 5.38 cents per gallon during the last quarter.

The average price of regular-grade gasoline f. o. b. Oklahoma (group 3) approximated 10.13 cents per gallon during 1949, a decline of about 1 cent per gallon compared to the previous year; however, the market was unusually steady throughout the entire period.

Average monthly refinery prices for several grades of LP-gas at various cities are shown in Platt's Oil Price Handbook for 1947 and 1948; however, the quotations in the 1949 edition are limited to New York and Philadelphia. The average refinery prices for 1949 showed pronounced declines from 1948 levels and approached values prevailing in 1947. The average refinery price for commercial propane at New York Harbor rose from 6.58 cents in 1947 to 9 cents in 1948 and declined to a 6.49-cent average in 1949. Commercial propane at Philadelphia averaged 6.56 cents a gallon in 1947, 8.94 cents in 1948, and then down to 6.44 cents in 1949.

TECHNOLOGY

Owing to the vast expansion program in the natural-gasoline industry, the daily capacity of all natural-gasoline plants totaled 20.6 million gallons by the end of 1949, and cycle plants accounted for an additional 6.6 million gallons capacity per day. The trend toward extraction of higher propane yields has been accelerated during the year by installation of refrigeration or other equipment, which results in lowering the temperature of the absorption oil, or through increasing the lean-oil circulation rate. An article in the Oil and Gas Journal (April 20, 1950) entitled "Application of Refrigeration Results in Obtaining Higher Yields," states:

> A method for achieving this result is the use of rich-oil deethanization prior to stripping. Where propane recoveries in the range of 70 percent are desired, this scheme has been found to result in low capital and operating costs. Through use of special heat-exchanger arrangements, good heat economy likewise is obtained.

Another significant trend is the underground storage of surplus LP-gases during summer months. This procedure is considerably beyond the experimental stage, one company stores 95,000 barrels of LP-gases in the Bodcaw sand in Oklahoma. A twofold purpose was served: (1) An adequate supply of LP-gases was available during the winter months; and (2) storage of these products was a conservation program, as it was not necessary to burn them during the slack season.

Another company reports economical storage of LP-gases, utilizing salt-water sands, where surplus products may be stored until demand warrants their removal from the underground reservoirs. The products can then be re-produced without further processing, other than removal of the salt water.

Still another trend is the upgrading of cycle-plant gasoline octane number at central plants, to improve its competitive position relative to refinery gasolines. Another noteworthy development of natural-gasoline and cycle plants is the sharp increase in the manufacture of finished gasoline and naphtha which gained over 25 percent in 1949 compared with the preceding year. Some cycle plants have installed small catalytic reformer units to manufacture high-quality finished motor fuel.

FOREIGN TRADE [4]

Exports of natural gasoline in 1949 totaled 183,267 thousand gallons, contrasted with 170,774 thousand gallons the preceding year, an increase of 7 percent. Value of the product decreased to $17,464,514 in 1949 in comparison with $20,126,140 the previous year owing to the break in the natural-gasoline market. Canada was the largest importer, taking 32 percent of United States exports; the United Kingdom was next with 24 percent, and the Netherlands Antilles received 20 percent.

Shipments of LP-gases abroad totaled 53,383 thousand gallons valued at $5,777,393 compared with 45,520 thousand gallons valued at $5,259,048 in 1948. Canada continued to be the largest importer, with 58 percent; Mexico ranked second, with 30 percent, Brazil 6 percent, and Philippine Republic almost 2 percent. Many other countries received shipments during 1949 in smaller quantities.

LP-gases exported from the United States, 1945–49, by countries, in thousands of gallons [1]

Nickel

By Hubert W. Davis

GENERAL SUMMARY

THE 2-year upward trend in consumption of nickel in the United States was reversed in 1949, largely because of marked declines in outputs of engineering and stainless steels, and copper-nickel alloys. Total consumption of nickel in 1949 was 27 percent smaller than in 1948, which, however, was a peacetime record. On the other hand, deliveries to the National Stockpile were substantially greater. Despite the much smaller consumption, output of nickel in Canada declined only 3 percent in 1949. The drop in sales of Canadian nickel, however, was more pronounced. Imports of nickel into the United States were 5 percent less in 1949 than in 1948. Receipts of nickel from Canada dropped 6 percent, but this decline was partly offset by a gain of 22 percent in imports from Norway. Production of nickel matte and ferronickel in New Caledonia was hampered by an inadequate supply of ore. Domestic output of nickel was, as heretofore, small in 1949.

Salient statistics for nickel, 1945–49

	1945	1946	1947	1948	1949
United States:					
Production:					
Primary short tons	1,155	352	646	883	790
Secondary do	6,483	8,248	9,541	8,850	5,680
Imports (gross weight) [1] do	122,528	104,734	88,408	106,939	97,144
Exports (gross weight) [2] do	3,876	7,977	12,037	8,184	4,503
Consumption do	96,252	80,105	80,757	93,558	68,326

Exports do	108,222	111,422	117,056	131,840	127,141
World production do	160,000	136,000	154,000	166,000	161,000

[1] Excludes "All other manufactures of nickel"; weight not recorded.
[2] Excludes "Manufactures"; weight not recorded.
[3] Price quoted to United States buyers by International Nickel Co., Inc., for electrolytic nickel in carlots f. o. b. Port Colborne, Ontario; price includes duty of 2½ cents a pound 1945–47 and 1¼ cents 1948–49.

The steel industry continued to be the chief consumer of nickel in the United States. Usage of nickel in stainless steels was 27 percent less in 1949 than in 1948, but that for other steels was 38 percent smaller. Consumption of nickel in high-temperature and electric-resistance alloys was down 34 percent, but that for anodes decreased only 3 percent. The use of nickel in cast irons was 19 percent less. Most of the nickel consumed in 1949 was in the form of metal; proportionately less oxide and oxide sinter were used than in 1948.

Since July 22, 1948, the contract price to United States buyers for electrolytic nickel in carlots f. o. b. Port Colborne, Ontario, has been 40 cents a pound, including duty of 1¼ cents a pound; and for nickel oxide sinter (on which there is no duty) f. o. b. Copper Cliff, Ontario, 36¼ cents (nickel content) a pound.

PRODUCTION

Domestic production of nickel is small and comprises metals recovered from scrap-nickel anodes, nickel-silver, and copper-nickel alloys (including Monel metal) and primary nickel recovered in copper refining and produced from ore and as a byproduct of talc production. Domestic primary nickel production totaled 1,581,000 pounds in 1949 and comprised both crude and refined nickel sulfate recovered as a byproduct of copper refining at Baltimore, Md.; Carteret and Perth Amboy, N. J.; Laurel Hill, N. Y.; and Tacoma, Wash. Shipments were 1,577,000 pounds, the bulk of which was crude nickel sulfate sold to refiners for use as an intermediate in the manufacture of refined nickel salts. Although all the nickel recovered as a byproduct of copper refining is credited to domestic production, some is recovered from imported blister copper. There has been no production of nickel from ore or as a byproduct of talc production since 1945.

In addition to the nickel recovered as a byproduct of copper refining in 1949, 4,618,000 pounds (nickel content) of refined salts (chiefly sulfate) were produced in the United States from Canadian cobalt-nickel ore and nickel residues, from domestic crude nickel sulfate, and from nickel cathode, shot, and scrap.

The total production of refined nickel salts in the United States was 5,125,000 pounds (nickel content) in 1949; shipments to consumers for electroplating, catalysts, and ceramics were 4,987,000 pounds.

Nickel produced in the United States, 1945–49

Year	Primary (short tons) [1]		Secondary	
	Byproduct of copper refining	Other	Short tons	Value
1945	719	436	6,483	$4,538,100
1946	352		8,248	5,801,600
1947	646		9,541	7,188,189
1948	883		8,850	6,966,720
1949	790		5,680	4,877,984

[1] Bureau of Mines not at liberty to publish value.

CONSUMPTION AND CONSUMERS' STOCKS

The accompanying tables give data on consumption and consumers' stocks of nickel. The data cover all known consumers of nickel in the form of primary and secondary metal, matte, and oxide. The figures for nickel salts, however, fall short of the total and probably represent only 51 and 43 percent, respectively, of the totals in 1949 and 1948.

Nickel (exclusive of scrap) consumed and in stock in the United States, 1948–49, by forms, in pounds of nickel

Form	1948			1949		
	Consumption	Stocks at consumers' plants Dec. 31	In transit to consumers' plants Dec. 31	Consumption	Stocks at consumers' plants Dec. 31	In transit to consumers' plants Dec. 31

[1] Comprises copper-nickel alloys, nickel-silver, brass, bronze, beryllium alloys, magnesium and aluminum alloys, Monel, Inconel, and malleable nickel.

FOREIGN TRADE [1]

Imports of nickel into the United States were 5 percent less in 1949 than in 1948. Imports in 1949 comprised chiefly refined nickel, matte, oxide, scrap, and nickel residues. As heretofore, Canada was the chief source of the imports; it supplied 137,072,528 pounds of refined nickel (pig, ingot, shot, and cathode), 3,327 pounds of bars, rods, etc., 22,256,644 pounds of roasted and sintered matte (averaging about 68 percent nickel), 24,483,602 pounds of oxide and oxide sinter (averaging about 74 percent nickel), 224,632 pounds of nickel scrap, and an undetermined quantity of nickel residues. The matte is refined to Monel metal at the plant of the International Nickel Co., Inc., Huntington, W. Va. Norway furnished 7,572,420 pounds of refined nickel. The United Kingdom supplied 35,607 pounds of refined nickel, 2,406,474 pounds of nickel scrap, and 808 pounds of bars, rods, etc. Germany furnished 344 pounds of refined nickel and 4,634 pounds of bars, rods, etc., and Netherlands, Belgium-Luxembourg, Mozambique, and Libya 196,038, 29,485, 450, and 399 pounds,

[1] Figures on imports and exports compiled by M. B. Price and E. D. Page, of the Bureau of Mines, from records of the U. S. Department of Commerce.

respectively, of nickel scrap. Sweden supplied 57 pounds of bars, rods, etc.

The nickel content of the unmanufactured nickel products imported into the United States is estimated at 182,942,000 pounds in 1949, compared with 192,800,000 pounds (revised figure) in 1948.

Since January 1, 1948, the rate of duty on refined nickel imported into the United States has been 1¼ cents a pound. Nickel ore, matte, oxide, and scrap entered the United States duty free.

Exports of nickel comprise largely products manufactured from imported raw materials. Exports of alloys and scrap (including Monel metal), which comprise the bulk of the foreign shipments, were 52 percent less in 1949 than in 1948; those of refined nickel, nickel-chrome electric-resistance wire, and nickel silver were 40, 8, and 19 percent, respectively, smaller.

The United Kingdom (3,405,107 pounds) and Canada (2,646,415 pounds) were the chief foreign markets for refined nickel, Monel metal, alloys, and scrap in 1949.

Nickel products (excluding residues) imported for consumption in the United States, 1947–49, by classes

[U. S. Department of Commerce]

Class	1947		1948		1949

WORLD REVIEW

The accompanying table shows world production of nickel by countries, 1942–49, insofar as statistics are available. Despite the fact that nickel is produced in many countries, one country—Canada—has supplied about 78 percent of the world output since 1942.

World mine production of nickel, by countries, 1942–49, in metric tons of contained metal

[Compiled by Berenice B. Mitchell]

1 Data not available; estimate by author of chapter included in total.
2 Estimate.
3 Preliminary data for year ended Mar. 31 of year following that stated.
4 Less than 1 ton.
5 Byproduct in electrolytic refining of copper. In 1944 and 1945 includes also production from ore.

Brazil.—According to the Mining Journal:[2]

> The important deposit of nickel at San José de Tocantins is being worked by the Empressa Comercial de Goias S. A. The ore shows an average content of 12 to 13 percent. It is now conveyed by road to Anapolis, 130 miles south, and thence by rail to Santos, a distance of 804 miles. Within the Jacuba, Forquilha, and Cachimbo area a visible reserve of more than 2,000,000 tons has been found, most of it with a 5-percent nickel content. Due to the high transportation costs the National Department of Mineral Production suggests building local mills for the preparation of ferronickel with a 75-percent nickel content. Exports of nickel from Brazil to Germany exceeded 4,000 tons annually before the war.

Canada.—Virtually all the Canadian nickel output is derived from the copper-nickel ores of the Sudbury district, Ontario. Some nickel is also recovered as a byproduct from silver-cobalt ores of cobalt. Two companies—International Nickel Co. of Canada, Ltd., and Falconbridge Nickel Mines, Ltd.—are the principal producers. Nickel production in Canada was 128,328 short tons in 1949 compared with 131,740 tons in 1948. Exports of nickel from Canada were 127,141 short tons in 1949 compared with 131,840 tons in 1948.

Sales of nickel in all forms by the International Nickel Co. of Canada, Ltd., were 209,292,257 pounds in 1949 compared with 240,098,274 pounds in 1948.[3] The 13-percent decline in sales was caused by inventory adjustments by consuming industries, work stoppages in the steel mills, and uncertainties in the business outlook

2 Mining Journal (London), vol. 234, No. 5978, Mar. 17, 1950, p. 258.
3 International Nickel Co. of Canada, Ltd., Annual Report: 1949, 16 pp.

in the United States. About 85 percent of the 1949 total was sold in the United States, Great Britain, and Canada.

Ore mined was 9,984,891 short tons in 1949 compared with 10,866,-862 tons in 1948. Underground development in the operating mines totaled 84,654 feet in 1949, bringing the total footage to 1,408,314 or over 266 miles. Proved ore reserves at the end of 1949 were 251,805,-000 short tons containing 7,630,000 tons of nickel-copper compared with 246,177,000 tons containing 7,503,000 tons of nickel-copper at the end of 1948.

Concerning developments in 1949, the company reported as follows:

> The year was marked by much activity in preparing our underground mines for greater production of ore to compensate for the nearing completion of our working of the low-grade Frood-Stobie open pits. The No. 2 Shaft at the Murray Mine is being deepened from the 1500 level to the 3450 level and sinking is proceeding on a three-shift basis. At the Levack Mine, preparatory work has been done for deepening the No. 2 Shaft approximately 1,050 feet. Excavation is also under way at Levack for an internal shaft with necessary permanent hoist and headframe installations. Development from the No. 2 Shaft at Garson Mine was continued at all levels below the 2000 level. At the Frood-Stobie Mine, further progress was made on development from the No. 7 Shaft and in the areas immediately below the bottom of the open pits which are to be mined from underground.
>
> Satisfactory progress has been made on the project for the mining of lower grade ores from the Creighton Mine. A new No. 7 Creighton Shaft is being sunk to a depth of approximately 2,000 feet and a new Concentrator under construction at the mine site is scheduled to be completed by 1951. The foundations for the building to house the Crushing Plant and Mill have been completed. The Concentrator will have a capacity of 6,000 tons per day and will supply the concentrate by pipe line to Copper Cliff, a distance of approximately 7½ miles.

The change-over from the Orford process to the new matte flotation process for the separation of nickel and copper was completed in July 1949. The entire output of the company's nickel is now handled by this new process.

Falconbridge Nickel Mines, Ltd.,[4] reported that its mine, smelter, and refinery production reached new peaks in 1949, but sales were slightly below 1948. Ore treated was 941,929 short tons in 1949 compared with 821,259 tons in 1948. Although refinery production was 18 percent greater than in 1948, it did not pace smelter production, and as a consequence inventory of matte increased. However, the program underway at the refinery at Kristiansand, Norway, will increase capacity sufficiently to handle the accumulated surplus of matte. At the Falconbridge mine, which produced 921,916 short tons of ore in 1949, the internal shaft reached a depth of 4,000 feet at the year end; stations were established at 175-foot intervals, and loading pockets for development work were completed and collared. At the McKim mine, which yielded 15,896 tons of ore, preproduction development made good progress in 1949, and tonnages and grades of ore indicated by diamond drilling have been proved by drifting on four upper levels. The ore-pass system to the 1300 loading pocket was completed, and a ventilation-escapement raise was driven from the 300 level to surface and was being extended to lower levels. The Bexora nickel prospect was thoroughly tested during a 6-month period, but no commercial ore bodies were found and the option was dropped. Field parties were active in southern Manitoba and in

[4] Falconbridge Nickel Mines, Ltd., 21st Annual Report: 1949, 18 pp.

Ontario. At the year end three properties were under option for investigations in 1950. Ore reserves of the company totaled 14,791,000 short tons on December 31, 1949, and comprised 8,592,000 tons of developed ore averaging 1.62 percent nickel in the Falconbridge and McKim mines and 6,199,000 tons of indicated ore averaging 1.86 percent nickel in Sudbury district holdings.

The Sherritt Gordon Mines, Ltd.,[5] continued its program of exploration and development of nickel-copper ores in the Lynn Lake area of northern Manitoba in 1949. Sinking of the "A" shaft was completed, and a pilot mill of 50 tons daily capacity was built. At the end of 1949 the ore reserves were calculated at 10,365,000 tons averaging 1.443 percent nickel and 0.681 percent copper, which, according to the company, is sufficient to support a 2,000-ton-per-day operation for about 15 years. The results of the pilot-mill operation at Lynn Lake and of the pilot leaching plant operation at Ottawa exceeded expectations. In 1949, 288 tons of concentrates were produced from 2,245 tons of ore milled; and over 100 tons of concentrates were shipped to Ottawa.

Chile.[6]—Nickel deposits have been discovered near Concepcion, about 250 miles south of Santiago, and work was in progress to determine the size and value of the deposit.

Indonesia.—According to Metal Bulletin: [7]

> Exploration for nickel ores by N. V. Mijnbouw Mattschappij Celebes has been making steady progress. Contact has been established with a foreign group which examined samples of the ores. These examinations have yielded results satisfactory in every way.

New Caledonia.—The Pin-Pin concession at Moindah, 130 miles north of Noumea, and the Thio Group at Thio, on the east coast, both belonging to La Société le Nickel, were the only nickel properties in production in 1949. However, the Pin-Pin concession discontinued operation in April. Output of ore was 93,870 metric tons and comprised 91,730 tons averaging 3.5 percent nickel at the Thio Group and 2,140 tons averaging 7.5 percent nickel at the Pin-Pin concession. Output of ore in 1949 was inadequate to pace consumption; as a consequence, only one blast furnace, one electric furnace, and two Bessemer converters were operated.

Production of matte was 3,950 metric tons averaging 77 percent nickel in 1949 (2,208 tons in 1948).

Production of ferronickel was 1,936 metric tons averaging 37 percent nickel in 1949 (4,049 tons in 1948).

La Société le Nickel expected to receive much heavy mining and conveying equipment from the United States under Economic Cooperation Administration allotments to triple mine-extraction rates.

Norway.[8]—Operating conditions in 1949 at the Falconbridge nickel refinery at Kristiansand, with respect to power, materials, and supplies, showed a marked improvement over previous years, but the shortage of skilled labor continued and was particularly acute during the summer. Moreover, the modernization program involving the addition of buildings and equipment to the existing plant interfered

somewhat with production during 1949. Nevertheless, refinery production, at 18 percent above 1948, established a new peak. An active research and development program was continued during 1949, with particular emphasis on the new chloride electrolyte process, cobalt recovery, and quality of special products.

Union of South Africa.—A small quantity (618 metric tons in 1949) of nickel in the form of matte is produced annually in the Rustenburg district, Union of South Africa, by Rustenburg Platinum Mines, Ltd. The matte is exported to England for refining.

United Kingdom.—Nickel production by the Mond Nickel Co. at the refinery at Clydach, Wales, was 49,400,000 pounds in 1949 compared with 39,800,000 pounds in 1948.

Nitrogen Compounds

By Bertrand L. Johnson

GENERAL SUMMARY

THE United States—the largest producer and importer of nitrogen in the world—was still experiencing a shortage of nitrogen when 1949 opened. During much of the year supplies of nitrogenous fertilizer were inadequate for agricultural use. Later, conditions improved, and toward the end of the year the supply and demand were reported balanced. Temporarily, at least, existing facilities could supply the present and the probable future demands for nitrogen, provided that war does not increase the need for a further munition supply and thereby curtail quantities available for agricultural use.

There were no Government controls over the distribution of nitrogenous fertilizers by private producers for use in domestic agriculture. Exports were allocated during the first half of 1949 through the Food and Agriculture Organization of the United Nations, and export quotas were maintained during much of the balance of the year after the allocation by the International Emergency Food Committee stopped June 30, 1949.

Laws enacted by Congress in 1948 required the Army to supply 50 percent of the export requirements of the United States in the nonoccupied areas under the IEFC nitrogen-allocation program and also to make available 10 percent of its anhydrous ammonia production to domestic ammonium sulfate producers facing shut-down because of lack of material. Both of these laws were repealed by Congress September 29, 1949.

Ammonia solutions (including liquid anhydrous ammonia), ammonium sulfate, ammonium nitrate, and synthetic sodium nitrate form the principal part of our domestic production of nitrogen compounds. Little industrial chemical nitrogen is imported, but large quantities of nitrogenous fertilizer materials enter the United States each year. Export fertilizer nitrogen is mostly in the form of ammonium sulfate and ammonium nitrate, large quantities of which are shipped abroad. Much smaller tonnages of anhydrous ammonia and ammonium nitrate are exported as industrial chemicals.

DOMESTIC PRODUCTION

Ammonium Compounds.—Domestic production of synthetic anhydrous ammonia reached a new high in 1949 of 1,294,057 short tons. Sixteen plants were in operation in 11 States; several of the private plants had considerably increased their productive capacity.

At the beginning of 1949 the Army had remaining in its possession two operating anhydrous ammonia plants—the Morgantown Ordnance Works, Morgantown, W. Va., and the Ohio River Ordnance Works,

West Henderson, Ky.—and two lines of anhydrous-ammonia production equipment of the Louisiana Ordnance Works, Louisiana, Mo., which were later erected at the San Jacinto Ordnance Depot, near Houston, Tex. This work was completed late in 1949, and operation of the first unit was begun about the first of 1950. The Army also had an option on the entire production of the Cactus plant at Etter, Tex., to meet its need for nitrogen in occupied areas. Later in the year it released the output of this plant from export requirements. At the end of 1949 the Army was planning to close its three synthetic ammonia plants, as adequate quantities to meet its fertilizer requirements in Japan and Korea were available from private industry.

Nitrogen compounds produced in the United States, 1946–49, in short tons

	1946	1947	1948	1949
Ammonia (NH_3):

[1] Data from Bureau of the Census monthly Facts for Industry series.
[2] Revised figure.
[3] Does not include ammonium sulfate produced at byproduct coking plants from purchased anhydrous ammonia as follows: 1946 (no data); 1947—11,070 short tons; 1948—30,749 short tons; 1949—58,826 short tons

The total production of ammonium sulfate from both synthetic and byproduct sources jumped more than half a million tons in 1949 to 1,603,002 short tons, an increase of 46 percent, owing to a marked increase in the production of synthetic ammonium sulfate.

Production of byproduct coke-oven ammonium sulfate was cut down in 1949 to 756,807 short tons from 830,683 tons in 1948, because of a strike in the domestic steel industry, but reportedly without causing serious damage to the fertilizer mixers during the mill shut-down.

Within the past year or so, a number of plants have been built to produce synthetic sulfate of ammonia from anhydrous ammonia; and there has been a large and increasing production of this material, the output of which in 1949 was greater than that of byproduct coke-oven ammonium sulfate. Synthetic ammonium sulfate technical was produced in 15 plants in 7 States and in 5 coke-oven plants manufacturing ammonium sulfate from purchased synthetic anhydrous ammonia. The production rose from 264,476 short tons in 1948 to 846,195 tons in 1949, an increase of 220 percent. The continued increase in supplies of synthetic sulfate of ammonia will tend to reduce the dependency of the fertilizer industry on coke-oven products.

The Government-owned wartime experimental plant at Salem, Oreg., built originally for the production of alumina from clay, and now available for sale, was operated by Columbia Metals Corp. for the production of synthetic ammonium sulfate during part of the first half of 1949, on an interim lease expiring June 30, 1949. It was then turned back to the Real Property Disposal Division (formerly War Assets Administration) of General Services Administration.

The postwar conversion to fertilizer production of synthetic ammonia plants built for war purposes made possible a notable increase in the output of ammonium nitrate. The synthetic ammonia is first oxidized to nitric acid, which is then neutralized with ammonia to produce ammonium nitrate. In 1949 the production of this material rose to 1,018,706 short tons from 988,342 tons in 1948, but still was 68,163 tons below the 1947 high. Ammonium nitrate of fertilizer grade was produced in 6 plants in 6 States. Ammonium nitrate of other grades came from 23 plants in 13 States.

Sodium Nitrate.—The synthetic nitrate of soda consumed in the United States in 1949 was produced domestically. None of the synthetic is known to have been imported. Before 1949 the only regular commercial producer was the Solvay Process Division, Allied Chemical & Dye Corp., which manufactured it at its Hopewell, Va., plant and marketed it under the brand name "Arcadian." Another producer entered the field in 1949—the Mathieson Chemical Corp. This company began producing synthetic nitrate of soda at its Lake Charles, La., plant in October 1949, using anhydrous ammonia and soda ash as raw materials.

The domestic output of synthetic sodium nitrate in 1949 is reported to have been produced at a rate double that of 1948. The export program was said to have taken 3 percent of the production. The increased production and a drop in demand from the glass and chemical trades made more material available for fertilizer.

Deposits of soluble nitrate minerals, none of present economic importance, are scattered throughout the United States. (See Minerals Yearbook 1942, p. 1522.)

CONSUMPTION AND USES

Anhydrous ammonia and solutions—the leading forms of nitrogen for fertilizer purposes—supply over 30 percent of all nitrogen consumed in agricultural fertilizers. The use of liquid ammonia as a source of nitrogen has been increasing; in 1947 it is reported to have totaled—in the United States—about 35,000 tons, slightly more than 4 percent of all chemical nitrogen used in this country.

Ammonium sulfate supplying a little over 20 percent of the fertilizer nitrogen stands second as a source of nitrogen for nitrogenous fertilizers. Both the "converted" type made from byproduct ammonia from coke-oven distillation and that made from purchased synthetic ammonia are employed, principally in mixed fertilizers, only a small percentage being utilized for direct application. While coke-oven sulfate of ammonia production was low during the steel strike in 1949,

the demand from the mixers is also reported to have slowed owing to an accumulation of mixed fertilizers.

Ammonium nitrate was first employed in mixed fertilizers about 1930 and was first applied as a top dressing in the 1942–43 season. For the year ended June 30, 1950, the United States Department of Agriculture estimated that 430,000 short tons, with a nitrogen content of 142,000 tons, were used in agriculture. Consumption in recent years is thus seen to have increased rapidly, and ammonium nitrate now ranks third in the United States as a source of fertilizer nitrogen, furnishing over 15 percent of the total fertilizer nitrogen consumed in 1949 in the United States.

The balance of fertilizer nitrogen comes from sodium nitrate, calcium cyanamide, some miscellaneous products, and natural organics.

An increasing demand is reported for anhydrous ammonia and its compounds for industrial use in the production of plastics and synthetic fibers and for refrigeration, as well as for the production of urea. The latter compound is in demand, not only for fertilizer, but also for animal feeds and plastics.

PRICES

Chilean Nitrate.—The base rate for imported Chilean nitrate of soda at the usual ports of importation throughout most of December 1948 was $48 per ton for the bulk product and $51.50 per ton for the bagged material. On December 31, 1948, the prices were advanced $3 per ton, bringing the price for the bulk product to $51 per ton and for the bagged nitrate to $54.50 per ton of 2,000 pounds. These prices are for shipment in carlots, f. o. b. cars at the port warehouse from which delivery is made. In October 1949, Chilean nitrate prices were reduced $3 per ton to the prices prevailing during the latter part of the previous year—$48 per ton for bulk and $51.50 for bagged material—reportedly because of competition from synthetic nitrate. These prices were in effect the balance of the year.

Synthetic Nitrate.—Prices for domestic synthetic nitrate of soda, crude, carlots, works, as quoted in Oil, Paint and Drug Reporter, remained throughout 1949 at the prices effective October 1, 1948—$45 per ton in bulk and $48.50 for the bagged material. The supply position improved during the year. Increased production and decreased demand from the glass and chemical trades is reported to have made more material available for fertilizer. At the end of the year, domestic nitrate is said to have been selling at certain South Atlantic and Gulf ports at prices competitive with imported nitrate.

FOREIGN TRADE [1]

Large amounts of natural sodium nitrate from Chile enter the United States each year, the quantity greatly exceeding the tonnage of any other nitrogenous material. The domestic demand for Chilean sodium nitrate, as indicated by the imports, declined in 1949 from 1948 but did not recede to the levels of 1946 and 1947. The

[1] Figures on imports and exports compiled by M. B. Price and E. D. Page, of the Bureau of Mines, from records of the U. S. Department of Commerce.

quantity imported fell from 709,573 short tons in 1948 to 675,543 tons in 1949. The total value of the imports in 1949, however, exceeded the record made in 1948, reaching a new high level of $26,006,053.

Early in 1949 the domestic demand for natural Chilean nitrate was greater than the supply, there were no stocks on hand, and the market position was tight. By June the supply position had improved appreciably, and by August stocks had accumulated, meeting requirements without difficulty. Supplies were no longer a problem. For the balance of the year stocks remained ample to meet requirements.

Small, irregular imports of Chilean sodium-potassium nitrate into the United States have been the rule in recent years. In 1948 there were no known imports; but in 1949 they suddenly jumped to 6,802 short tons, valued at $310,343.

[1] All from Chile except sodium nitrate from Canada as follows: 1947: 42 tons, $2,542; 1948: 199 tons, $11,057; 1949: 8 tons, $416.
[2] Revised figure.

In July 1949 the Office of International Trade, United States Department of Commerce, announced that an export quota permitting shipments of nitrogenous fertilizer containing up to 52,000 short tons of nitrogen had been established for the fiscal year July 1949 through June 1950. No country quotas were announced. This was 10,000 tons less than that for the previous fiscal year because of increases in nitrogenous fertilizer production in some foreign countries. On September 23 a supplemental quota of 30,000 tons was announced, raising the total amount of nitrogen that could be exported in the form of fertilizers during the fiscal year ended June 30, 1950, to 82,000 tons. On November 23, 1949, another supplemental quota was announced, permitting additional exports up to 25,000 tons of nitrogen, shipments to be made before January 25, 1950. These supplemental quotas were established to relieve members of the nitrogenous fertilizer industry who had surplus stocks on hand. On December 5, 1949, OIT announced removal of all quantitative quotas from exports of most nitrogenous fertilizer materials made before January 25, 1950. This relaxation of export controls was made possible by increased domestic supplies of nitrogenous fertilizers. Controls on ammonium nitrate and materials containing ammonium nitrate were, however, retained because of the possibility that these materials might be used for munitions making, and licenses were required for exporting these materials.

WORLD REVIEW

The world-wide shortage of nitrogen prevalent after World War II continued into 1949; but during the year the nitrogen situation became more favorable, and at the end of 1949 the world nitrogen shortage was apparently over. During most of the year there had been inadequate supplies of nitrogen for agricultural use. At the close, however, the productive capacity for fertilizer nitrogen products exceeded the prospective demand for the immediate future on the basis of normal peacetime demands, but the supply would not be adequate in a wartime economy.

Control of world nitrogen exports continued, in the first half of 1949, under the auspices of the Food and Agriculture Organization of the United Nations. This international allocation of nitrogen fertilizers from exporting countries was discontinued June 30, 1949. Since then, exporting countries have been entitled to sell to any importing country, and importing countries have been free to buy from any exporting country. United States export controls, however, were retained.

World nitrogen supplies (excluding U. S. S. R.) for the 1949–50 year have been estimated by Aikman (London), Ltd., at 3,599,000 metric tons of agricultural nitrogen and 575,000 tons for industry. The Food and Agriculture Organization of the United Nations early in 1950 estimated 3,310,900 metric tons for the production of fertilizer nitrogen in 1948–49 and 3,737,990 tons in 1949–50.

World production and consumption of fertilizer nitrogen compounds, by principal countries, fiscal years, 1948–50, in metric tons of contained nitrogen

Chile.—A new process of nitrate recovery—the Lesesne "butterfly" process—which is reported to recover 95 percent of the nitrate in the crude ore, was successfully operated on a pilot-plant scale in Chile by the Compania Salitrera de Tarapaca y Antofagasta and in February 1950 was placed in commercial operation at that company's Mapocho plant. This process employs a solar evaporation technique, as does the Guggenheim method, but differs from the latter in that it does not utilize ponds. The name of the process is derived from the butterflylike appearance of the sprinkling assembly of nozzles and supports mounted on a railroad tank car. The nitrate solution is sprayed on the ground, where it evaporates, leaving a thin coating of the salts. The deposit is harvested when it has reached a thickness of about 2½ inches. The yield is not pure sodium nitrate but a concentrated mixture of salts that has to be further refined for the fertilizer market.

The nitrate plant of the Compania Salitrera Iquique at Taltal, Chile, is reported to have been reopened in 1949 after having been closed for 15 years.

Peat

By J. A. Corgan and Golden V. Chiriaco

GENERAL SUMMARY

LITTLE change characterized the statistical picture of the peat industry in the United States in 1949 compared with 1948. Production totaled 129,532 short tons in 1949, a decline of less than 1 percent from the 129,581 tons produced in 1948. The average value per ton in 1949 showed a 10-percent increase over that in 1948. No exports of peat were reported for 1949. Imports increased about 4 percent over 1948 and accounted for about 42 percent of the total quantity consumed in this country in 1949.

In March 1949 a general conference was called by the Federal Trade Commission in Washington to set up trade-practice rules for the peat industry. Proposed rules were issued in September, after which several hearings were held, whereby all interested or affected parties, including peat operators, were given an opportunity to be heard. One of the controversial issues was the proper application of the terms "moss peat" and "peat moss" to a particular kind of peat. After full consideration of the facts submitted, the Federal Trade Commission promulgated, on January 13, 1950, a set of rules designed to foster and promote the maintenance of fair competitive conditions to protect the peat industry, trade, and the public. A copy of the rules may be obtained by writing to the Federal Trade Commission, Washington 25, D. C.

In March 1950, a bill was introduced in the Senate, which, if enacted, will authorize the United States Department of the Interior to survey the possibility of using peat and its related byproducts to increase our energy supply, thereby aiding in the conservation of fuel resources.

RESERVES

Peat occurs in about half of the States. An estimate of 13,827,000,000 short tons has been calculated as air-dried peat.[1] Minnesota, Wisconsin, and Michigan combined contain 75 percent of the reserves; 14 percent of the country's total is in Florida; and the rest is distributed through the New England and Pacific Coast States.

PRODUCTION

Peat production in the United States in 1949 totaled 129,532 short tons, a decline of less than 1 percent from the 129,581 tons produced in 1948. The peat produced in 1949 was valued at $1,020,014, compared with a total value of $929,560, recorded for 1948.

Forty-eight producers operating in 19 States accounted for the 1949 output. Although nine plants that produced peat in 1948 were inactive in 1949, this loss in production was compensated by the output from several plants that resumed production in 1949 after a year or two of inactivity.

[1] Soper, E. K., and Osbon, C. C., The Occurrence and Uses of Peat in the United States: U. S. Geol. Survey Bull. 728, 1922, p. 92.

The average value per ton in 1949 was $7.87, a 10-percent increase over the 1948 value of $7.17.

Peat produced in the United States, 1945–49

Year	Short tons	Value	
		Total	Per ton
1945 (estimated)	107,000	$821,000	$7.67
1946	140,707	1,006,231	7.15
1947	136,232	868,979	6.38
1948	129,581	929,560	7.17
1949	129,532	1,020,014	7.87

New Jersey was the largest peat-producing State in 1949, followed, in order of output, by Ohio, Minnesota, Florida, Michigan, Indiana, Illinois, Pennsylvania, Connecticut, California, Maine, Colorado, Wisconsin, Iowa, Georgia, Texas, Washington, Massachusetts, and New Hampshire.

About 60 percent of the total output in 1949 was designated as peat humus and was produced in 14 States. Reed or sedge peat, produced in 12 States, comprised about 32 percent; and moss peat and other, produced in 7 States, about 8 percent.

Peat produced in the United States, by States, 1947–49

USES

For many years peat has been used in this country principally for soil improvement. Of the total sales reported for 1949, 59 percent was used for this purpose, 32 percent for mixed fertilizers, and 9 percent for other purposes, including litter for poultry yards, for golf greens, in nurseries and greenhouses, for landscape plantings, etc.

Although some European countries utilize peat for fuel and power purposes, it has not been used generally in this country for fuel purposes because of ample supplies of higher-grade fuels at competitive prices.

Peat sold in the United States in 1946–49, by uses

Year	Soil improvement		Mixed fertilizers		Other uses		Total

United States Government Specifications.—The Federal Government purchases a certain amount of peat, provided it meets required specifications. These specifications may be obtained from the Federal Supply Service, General Services Administration, Washington 25, D. C.

IMPORTS[2]

Imports of peat totaled 94,747 short tons in 1949, an increase of 21 percent over the 1939 prewar figure of 78,611 tons and 4 percent more than the quantity imported in 1948 (91,073 short tons). No exports of peat were reported; consequently, the quantity available for domestic consumption in 1949 totaled 224,279 tons.

[2] Figures on imports compiled by M. B. Price and E. D. Page, of the Bureau of Mines, from records of the U. S. Department of Commerce.

[1] In addition to countries listed, Argentina, Australia, Poland, and U. S. S. R. produce peat, but data of production are not available; estimates for these are not included in total. U. S. S. R. produced approximately 20,000,000 tons in 1945.
[2] Data not available; estimate included in total.
[3] Estimate.
[4] American zone only.
[5] Bizonal area.
[6] Data represent Trianon Hungary after October 1944.
[7] Negligible.
[8] Data for 1943 are as reported to the Bureau of Mines by producers and probably represent only about ⅔ of total production. Data for 1944–49 believed to represent reasonably complete coverage.

Petroleum and Petroleum Products

By A. G. White, G. W. Cale, A. T. Coumbe, and A. L. Clapp

GENERAL SUMMARY

THE OUTSTANDING feature of the oil situation in 1949 was the sharp downward adjustment of crude production and the volume of refinery operations to meet a small decline in total demand and to secure some liquidation of the excess stocks of refined products on hand at the end of 1948.

The total demand for all oils in 1949 amounted to 2,233.7 million barrels or a daily average of 6,119,000 barrels, a decline of 0.4 percent from 1948. Total exports in 1949 amounted to 119.5 million barrels or 327,000 barrels daily, a decline of 11.1 percent compared with 1948. Domestic demand in continental United States totaled 2,114.2 million barrels in 1949 or 5,792,000 barrels daily, a gain of 0.3 percent. The downward trend in exports may be attributed to the expansion in crude production and refinery capacity abroad and the problem of obtaining dollar exchange to buy American oil products. The almost static domestic demand was, in considerable part, due to abnormal conditions. Unusually mild weather in the first and last quarters of 1949 reduced the demand for heating oils by an amount that may have reduced the total domestic demand for all oils by 2 to 3 percent. A sharp reduction in the volume of industrial operations in the middle of the year cut the demand for heavy fuel oils. The continued rapid expansion in the volume of natural gas marketed reduced the anticipated demand for both oil and coal.

The new supply of all oils in 1949 averaged 6,112,000 barrels daily, a decline of 324,000 barrels daily or 5.0 percent compared with 1948. Most of this decline was due to the difference in stock accumulation in the 2 years. Total stocks of all oils increased by 293,000 barrels daily in 1948, whereas such stocks declined 7,000 barrels daily in 1949. The production of domestic crude oil in 1949 was reduced drastically as every other source of new supply increased materially. Crude production averaged only 5,042,000 barrels daily in 1949, a decline of 478,000 barrels daily or 8.7 percent compared with 1948. The production of natural gasoline and other light oils averaged 428,000 barrels daily, a gain of 26,000 barrels daily or 6.5 percent compared with 1948. Total imports of all oils averaged 642,000 barrels daily in 1949, a gain of 128,000 barrels daily or 24.9 percent compared with 1948. The total demand for foreign and domestic crude oil averaged 5,476,000

barrels daily in 1949, a decline of 5.6 percent compared with 1948, and resulted in a drastic reduction in the volume of refinery operations.

In summary, 1948 represented a year in which the total demand gained 4.1 percent over the previous year and the total supply of all oils was inflated to the extent of adding 107 million barrels to total stocks. In 1949, there was a small decline in total demand due, in considerable part, to abnormal conditions, with new supply and demand in close balance but resulting in a drastic cut in relative crude demand and refinery operations compared with 1948.

TABLE 1.—Demand for all oils in the United States, 1940–49

[Millions of barrels]

Year	Domestic demand	Exports	Total demand	Year	Domestic demand	Exports	Total demand
1940	1,326.6	130.5	1,457.1	1945	1,772.7	183.0	1,955.7
1941	1,485.8	108.8	1,594.6	1946	1,792.8	153.1	1,945.9
1942	1,449.9	116.9	1,566.8	1947	1,989.8	164.5	2,154.3
1943	1,521.4	150.0	1,671.4	1948	2,113.7	134.7	2,248.4
1944	1,671.3	207.6	1,878.9	1949 [1]	2,114.2	119.5	2,233.7

[1] Preliminary figures.

In considering the probable trend of supply and demand in 1950, assuming normal conditions, there should be a substantial relative gain in total demand, including a further downward trend in exports and a considerable gain in domestic demand that might total 6 to 7 percent compared with 1949. About half of this increase represents the assumption of normal conditions in 1950 compared to abnormal conditions in 1949. Although some further liquidation of excess refined stocks seems probable, a materially larger new supply of all oils should be required, with a substantial gain in the volume of refinery operations. The extent of the recovery in the production of domestic crude will depend on the rate of increase in the production of light oils from natural gas and the trend of total imports.

The total production of crude oil declined from 2,020.2 million barrels in 1948 to 1,840.3 million in 1949, a decline of 8.7 percent on a daily average basis. The total decline in production amounted to 179.9 million barrels with Texas accounting for 159.5 million of the total. The average production of Texas decreased from 2,469,000 barrels daily in 1948 to 2,038,000 barrels daily in 1949, a decline of 17.5 percent. The major markets for Texas crude oil are at refineries in Texas and the east coast. The demand for Texas crude oil was affected in 1949 by the decline in exports, the large increase in imports, the unusually mild weather on the east coast, and adjustments for surplus stocks of refined products accumulated in these districts. Total stocks of crude oil increased 26.0 million barrels in 1948 and decreased 3.3 million in 1949. The total demand for crude oil declined from 2,123.3 million barrels in 1948 to 1,998.5 million in 1949, a daily average decline of 5.6 percent, including a decline of 7.5 percent in the demand for domestic crude oil and a gain of 25.1 percent in the demand for foreign crude oil.

Total imports of all oils increased from 188.1 million barrels in 1948 to 234.1 million in 1949, a daily average gain of 24.9 percent. Crude imports rose from 129.1 million barrels in 1948 to 154.9 million in 1949. Imports of refined products, mostly residual fuel oil, rose from 59.0 million barrels in 1948 to 79.2 million in 1949. Imports exceeded exports by 53.4 million barrels in 1948 and 114.6 million in 1949.

The total demand for all oils declined from 2,248.4 million barrels in 1948 to 2,233.7 million in 1949, representing a loss of 14.7 million, including a decline of 15.2 million barrels in exports and a gain of 0.5 million in domestic demand. The principal declines in exports were 9.1 million barrels for distillate fuel oil and 6.7 million for crude oil. The most important changes in domestic demand were a gain of 41.7 million barrels for motor fuel and declines of 12.6 million for distillate fuel oil, 9.5 million for kerosine, 5.2 million for residual fuel oil, and 13.8 million barrels for all other products.

The primary problem resulting from operations in 1948 was the increase of 79.8 million barrels in stocks of refined oils. The temporary oil shortages in the cold winter of 1947–48 furnished an incentive for an early seasonal build-up of stocks of fuel oils, and the subsequent decline in oil demand in the latter half of 1948 contributed to the surplus of stocks at the end of the year. Abnormally mild weather in the first and last quarters of 1949 prevented the reduction of fuel-oil stocks to normal seasonal levels. Total refined stocks were reduced by only 0.8 million barrels in 1949, including a gain of 13.5 million barrels in the California district and a decline of 14.3 million in districts east of California. This surplus stock problem, orginating in 1948, has finally been adjusted by the unexpectedly high demand in the first quarter of 1950 combined with an abnormally low rate of refinery operations.

The expansion in refinery capacity has been sufficient to permit greater flexibility in seasonal operations and better adjustment of product supply to meet unforeseen changes in demand. The total crude-oil capacity of refineries in the United States has risen from 5,569,482 barrels daily on January 1, 1947, to 6,696,300 barrels daily in January 1, 1950.

A brief review of the demand for the major oil products in 1949 should clarify the trends of total demand. The total demand for motor fuel continued the steady upward trend, with large gains in domestic demand to offset the variations in exports. The total demand for motor fuel in 1949 amounted to 952.4 million barrels, including 39.5 million barrels of exports and a domestic demand of 912.9 million. The daily average changes, compared with 1948, indicate a gain of 5.1 percent in total demand, an increase of 5.9 percent in exports, and a gain of 5 percent in domestic demand. Motor fuel was the only major product to show a substantial gain in demand in 1949. The increase in the number of motor vehicles should insure continued gains in demand for several years to come. Mild weather, which reduces fuel-oil demand, generally is favorable to motor transport.

The total demand for residual fuel oil amounted to 508.0 million barrels in 1949, including exports of almost 12.7 million and a domestic demand of 495.3 million barrels. Compared with 1948, on a daily average basis, this was a decline of 0.8 percent in total demand and domestic demand. The demand for residual fuel oil was sustained, in part, by sharp reductions in price early in 1949. The decline of 26.6 million barrels in consumption by railroads and the decrease of 4.7 million barrels in bunker use by ships engaged in the foreign trade was largely offset by the gain of 23.7 million barrels in consumption by public utility electric power plants.

[1] Bureau of Mines.
[2] U. S. Department of Commerce.
[3] Preliminary figures.
[4] Figures for 1948 on new basis, excluding distributors' stocks in California, and comparable with 1949 are as follows in thousands of barrels: Refined products, 343,537; total stocks, 605,743.

The total demand for distillate fuel oil amounted to 340.2 million barrels in 1949, including exports of 12.2 million and a domestic demand of 328.0 million barrels. On a daily average basis, compared with 1948, total demand declined 5.8 percent, exports fell 43.1 percent, and domestic demand was reduced 3.4 percent. Exports declined rapidly in both 1948 and 1949. Domestic demand was reduced materially in 1949 because of the decrease in heating-oil consumption due to abnormally mild weather. The expansion in the use of natural gas also reduced the rate of growth in distillate fuel-oil use.

The total demand for kerosine in 1949 amounted to 105.2 million barrels, including exports of 2.5 million and a domestic demand of 102.7 million barrels. The relative change from 1948, in daily averages, was a decline of about 9 percent in total demand, a loss of about 22 percent in exports, and a reduction of 8 percent in domestic demand. The sharp decline in the domestic demand for kerosine in 1949 was related to the effect of mild weather in reducing the use of heating oils and probably to a shift from kerosine to No. 1 distillate fuel oil in small space-heating installations.

The reduction of 13.9 million barrels in the total demand for all other products in 1949, compared with 1948, included a reduction of about 3.4 million barrels in the demand for lubricants and a decline of 14.8 million barrels in crude losses and refinery shortage. The total demand for petroleum coke increased 2.7 million barrels and the production of still gas rose 1.5 million barrels.

A brief review of supply and demand by quarters in 1949 will further clarify the trends during the year.

In the first quarter of 1949, both crude production at 5,328,000 barrels daily and total crude runs at 5,496,000 barrels daily were at the highest level during the year. Compared with the first quarter of 1948, total daily average imports were about 23 percent greater, including a gain of 50 percent for crude oil and a decline of about 8 percent for products. Total daily average demand, however, was 1.6 percent less than in 1948, including a gain of 13 percent in exports and a decline of 2.3 percent in domestic demand. The principal changes in daily average domestic demand were a gain of 5.5 percent for motor fuel and declines of 3.5 percent for residual, 4.0 percent for distillate, 14.7 percent for kerosine, and 11.6 percent for all other products. The abnormally mild weather in the first quarter of 1949, compared with the cold weather in the same period of 1948, was a major factor in the relative decline in the demand for fuel oils. Stocks of crude oil increased 12.7 million barrels during the quarter while stocks of refined products decreased only 5.4 million. Distributors and consumers evidently had unusually large stocks on hand, and seasonal restocking was postponed until later than normal.

In the second quarter of 1949, crude production dropped to only 4,963,000 barrels daily, and total crude run declined to 5,166,000 barrels daily, the lowest quarterly average during the year. Compared with the second quarter of 1948, total imports were 23 percent greater and total demand was 4.9 percent less, including a decline of 10.5 percent in exports and a drop of 4.5 percent in domestic demand. The principal changes in domestic demand were a gain of 5.6 percent for motor fuel and declines of 10.8 percent for residual fuel oil, 18.8

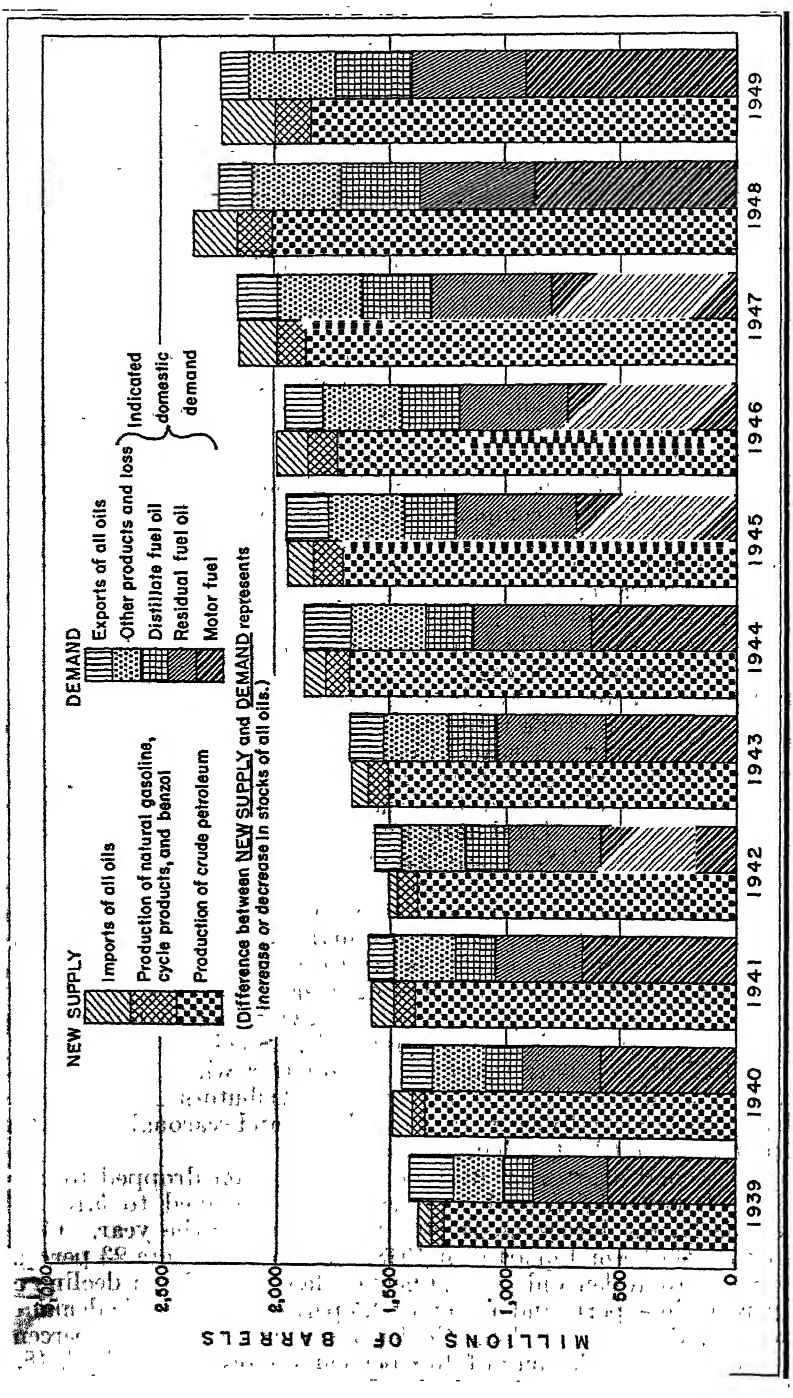

FIGURE 1.—Supply and demand of all oils in the United States, 1939–49.

percent for distillate fuel oil, 23.8 percent for kerosine, and 6.2 percent for all other products. Fuel-oil demand was reduced by a sharp drop in general industrial operations and by postponed restocking as distributors and consumers used up excess stocks left over from the first quarter. Stocks of crude oil increased 5.4 million barrels during the quarter, and stocks of refined products showed a seasonal gain of 14.9 million barrels.

In the third quarter of 1949, crude production declined further to 4,807,000 barrels daily, while total crude runs rose to 5,279,000 barrels daily. There was an upward trend in total imports, showing a gain of 21 percent compared with the third quarter of 1948. Total demand was 1.4 percent greater in the third quarter, compared with 1948, including a decline of about 26 percent in exports and a gain of 3.3 percent in domestic demand. The principal changes in domestic demand in the third quarter, compared with the same period of 1948, were gains of 4.0 percent for motor fuel, 1.7 percent for residual, and 8.7 percent for distillate, a decline of 1.9 percent for kerosine, and a gain of 1.0 percent for all other products. Stocks of crude oil were reduced 23.0 million barrels during the quarter, and stocks of refined products increased only 6.5 million barrels. While there was an upward trend in demand, stocks of refined products were still abnormally high.

In the fourth quarter of 1949, production of crude oil rose to 5,076,000 barrels daily and total crude runs increased to 5,381,000 barrels daily. Compared with the fourth quarter of 1948, total imports showed a gain of almost 32 percent, including an increase of about 99 percent in refined products. The total demand for all oils increased 3.5 percent, including a decline of about 19 percent in exports and a gain of 4.6 percent in domestic demand. The principal changes in domestic demand, compared with 1948, were gains of 5.1 percent for motor fuel, 10.1 percent for residual fuel oil, 1.1 percent for distillate fuel oil, and 5.9 percent for kerosine and a drop of 2.5 percent for other products. Total stocks of crude oil increased 1.7 million barrels during the fourth quarter and stocks of refined products declined 16.8 million. Abnormally mild weather materially reduced the normal demand for heating oils, but the demand for industrial fuel oil was strong and further increased by uncertainty as to adequate supplies of coal.

In the first quarter of 1950, crude production declined to 4,921,000 barrels daily and total crude runs to 5,380,000 barrels daily. Compared with the first quarter of 1949, total imports were about 38 percent greater, and total demand for all oils increased 8.8 percent, including a decline of almost 25 percent in exports and a gain of 10.8 percent in domestic demand. The principal changes in domestic demand compared with 1949 were gains of 7.7 percent for motor fuel, 11.3 percent for residual fuel oil, 15.2 percent for distillate fuel oil, 14.5 percent for kerosine, and 9.9 percent for other products. Stocks of crude oil were reduced 12.1 million barrels during the first quarter of 1950, and stocks of refined products declined 40.8 million barrels. The improvement in demand was primarily the result of normal weather and a shortage of coal that stimulated conversions to fuel oil.

This review covers a critical period of oil operations and demand. The abnormal accumulations of refined stocks in 1948 overhung the market and depressed refinery operations until the end of the first quarter of 1950, when such stocks were reduced to close to minimum seasonal levels. Mild weather in the first and last quarters of 1949 depressed the demand for heating oils far below normal. The rapid expansion in the volume of natural gas marketed has taken a substantial part of the increased fuel market that might have gone to oil or coal. The curtailment of coal supply during the past winter was a material stimulus to the substitution of oil fuel where conversion facilities were available, but much of this increased demand was met by a 100-percent gain in the imports of residual fuel oil in the winter of 1949–50 compared with the winter of 1948–49.

Demand in Noncontiguous Territories.—In computing domestic demand in continental United States, the shipments from the United States to the Territories are included with exports, and any imports from foreign countries to the Territories are deleted from total imports. The major part of such shipments from the United States go to Hawaii, Alaska, and Puerto Rico. Puerto Rico is normally the chief Territorial importer of foreign oils.

The accompanying table has been prepared to show shipments to the Territories from the United States and imports received by them. No crude oil is involved in their movements. The receipts of products from the United States plus the imports from foreign sources indicate the total supply available in the Territories and, less some minor reexports, indicate their total demand.

The figures for 1949 indicate that shipments to the Territories from the United States rose from 12,179,000 barrels in 1948 to 13,353,000 barrels in 1949 and that total direct imports from foreign countries increased from 2,567,000 barrels in 1948 to 2,881,000 barrels in 1949. The indicated total supply of all oils in the Territories rose from

[1] U. S. Department of Commerce: 1948 final data; 1949 preliminary data.
[2] Bureau of Mines data.

14,746,000 barrels in 1948 to 16,234,000 barrels in 1949. Reexports to foreign countries amounted to 234,000 barrels in 1948 and 258,000 barrels in 1949. (See table of exports by countries of destination, in the last section of this chapter.) These figures indicate a total net demand for oil products in the noncontiguous Territories of about 14.5 million barrels in 1948 and 16.0 million barrels in 1949. If these figures are added to the domestic demand figures for continental United States, the sum will show the total domestic demand within the political boundaries of the United States.

World Oil Supply.—World production of crude petroleum in 1949 declined from 3,433 million barrels in 1948 to 3,398 million in 1949. The total decline of 35 million barrels represents a decrease of 180 million barrels for the United States and a gain of 145 million for the rest of the world. The largest gains in production were 44 million barrels for Kuwait, 31 millions for Saudi Arabia, 15 million estimated for Russia, 14 million for Iran, 13 million for Indonesia, 10 million for Canada, and 6 million for Colombia. The chief decreases in production outside the United States were about 8 million barrels for Venezuela and less than 1 million for Argentina. The United States produced 54.2 percent of the world total in 1949 compared with 58.8 percent in 1948 and 61.4 percent in 1947.

According to data for 1949 in this report, exports and shipments of all oils from continental United States totaled 119.5 million barrels and imports 234.1 million, resulting in a net import of 114.6 million barrels in 1949 compared with a net import of 53.5 million in 1948. As total stocks of all oils declined 2.9 million barrels in 1949, the production of all oils in the United States of 1,996.7 million barrels was 117.5 million less than domestic demand in continental United States, amounting to 2,114.2 million barrels.

RESERVES

The Committee on Petroleum Reserves, American Petroleum Institute, estimated proved reserves of crude oil in the United States on December 31, 1949, at 24,649 million barrels, compared with 23,280 million on December 31, 1948. These estimates refer solely to proved or blocked-out reserves, including only oil recoverable under existing economic and operating conditions.

The increase in total net crude reserves in 1949 was 1,369 million barrels. In arriving at this net figure, the total of estimated new reserves added in 1949 was 3,188 million barrels, including an upward revision of 2,298 million of reserves due to extensions of old pools and revisions of previous estimates and an estimate of 890 million for new reserves discovered in 1949 in new fields and in new pools in old fields. From this estimate of total reserves added in 1949 was deducted an estimated production of 1,819 million barrels of crude oil during 1949 to determine the net gain in total reserves.

TABLE 5.—Estimates of proved oil reserves in the United States, on Dec. 31, 1943–49, by States [1]

[1] From reports of Committee on Petroleum Reserves, American Petroleum Institute, of the amount of crude oil that may be extracted by present methods from fields completely developed or sufficiently explored to permit reasonably accurate calculations. The change in reserves during any year represents total new discoveries, extensions, and revisions, minus production.
[2] New basis; excludes condensate.

The principal changes in net crude-oil reserves in 1949 were gains of 1,026 million barrels for Texas, 80 million for Oklahoma, 75 million for Illinois, 64 million for Kansas, 59 million for California, 41 million for Louisiana, 40 million for New Mexico, and 38 million for Mississippi. The principal declines were 24 million for Wyoming and 21 million for Colorado.

As of December 31, 1949, Texas had 54.8 percent of the total estimated reserves, California 15.5 percent, Louisiana 7.7 percent, and Oklahoma 5.4 percent—83.4 percent of the total for the four States combined.

The total proved reserves of natural-gas liquids, not included in the crude-oil reserves, were 3,729 million barrels on December 31, 1949. This figure, combined with the crude-oil reserves, made a proved reserve for all liquid hydrocarbons of 28,378 million barrels on December 31, 1949, compared with 26,821 million barrels as of December 31, 1948.

CRUDE PETROLEUM

SUPPLY AND DEMAND

The total demand for crude petroleum in 1949 amounted to 1,998.5 million barrels or an average of 5,475,000 barrels daily, a decline of 326,000 barrels daily or 5.6 percent compared with 1948. The demand for domestic crude oil declined from 5,460,000 barrels daily in 1948 to 5,048,000 barrels daily, a decrease of 412,000 barrels daily or 7.5 percent. The demand for foreign crude oil rose from 341,000 barrels daily in 1948 to 427,000 barrels daily in 1949, an increase of 86,000 barrels daily or 25.5 percent.

The new supply of crude petroleum in 1949 included a domestic production of 1,840.3 million barrels of 5,042,000 barrels daily and an import of 154.9 million barrels or 425,000 barrels daily. Total stocks of crude petroleum increased 71,000 barrels daily in 1948 but declined 9,000 barrels daily in 1949. Stocks of refined products increased 218,000 barrels daily in 1948 but declined 2,000 barrels daily in 1949. The total demand for all oils averaged 6,143,000 barrels daily in 1948 and 6,119,000 barrels daily in 1949, a decline of 24,000 barrels daily or 0.4 percent. (Daily averages are used in computing changes, since 1948 was a leap year with 366 days.)

The preceding figures indicate that crude demand was inflated in 1948 by large additions to stocks of crude oil and refined products. With a small decline in the total demand for all oils in 1949 and small withdrawals from stocks, compared with large gains in 1948, the total supply of crude oil required declined sharply, and the decline in domestic crude oil was even greater due to the large gain in crude imports.

Most of the excessive stocks of refined products at the end of 1948 were still on hand at the end of 1949 and were only reduced to normal levels during the first quarter of 1950, when demand for all oils was unexpectedly high and refinery operations were maintained at a low seasonal level.

In comparing the various uses for crude oil in 1949 with 1948, the changed basis for reporting crude transfers and runs in California in 1949 must be considered. If 1948 is revised to compare with the new basis used in 1949, some 17.3 million barrels of domestic crude oil will be added to total crude runs, involving a reduction of transfers of crude oil to residual fuel oil of 17.1 million barrels.

On this bases, the total demand for crude oil in 1949 remains the same, showing a decline from 1948 of 124.8 million barrels. Runs to stills were reduced from 2,048.3 million barrels (new basis) in 1948 to

1,945.5 million in 1949, a decline of 102.8 million barrels, 267,000 barrels daily or 4.8 percent. Crude exports declined from 39.7 million barrels in 1948 to 33.1 million in 1949. Transfers to residual and distillate fuel oils declined from 10.2 million barrels (new basis) in 1948 to 7.5 million in 1949, and crude losses declined from 25.0 million (new basis) in 1948 to 12.5 million in 1949.

PRODUCTION

General

Production of crude petroleum in the United States dropped from the record level of 2,020.2 million barrels in 1948 to 1,840.3 million in 1949, a decline of 478,000 barrels daily or 8.7 percent.

The decrease of 179.9 million barrels in crude production in 1949 compared with 1948 was distributed very irregularly among States. Only a few States showed gains, including Louisiana with an increase of 9.2 million barrels, Colorado with 6.1 million, Indiana with 2.6 million, and smaller gains for Utah and West Virginia. The principal declines in production in 1949 were 159.5 million barrels for Texas, 9 million for Kansas, 8.1 million for Wyoming, 7.8 million for Mississippi, 7.2 million for California, 1.7 million for Ohio, 1.7 million for Arkansas, and 1.3 million for Pennsylvania. In a few instances the declines may have been due to natural conditions affecting production, but generally they were due to a static market for all oils, lower refining operations resulting from excess product stocks, the sharp decline in the demand for heavy crudes used in fuel-oil production, and the low demand for lubricating oils.

Thirteen States produced over 10 million barrels of crude oil in 1949, representing 97.9 percent of total production in 1949 compared with 98.2 percent in 1948. Six States produced more than 50 mil-

lion barrels of oil in 1949, and these States combined produced 86.2 percent of the total in 1949 compared with 86.9 percent in 1948. Texas ranked first with 40.4 percent of the total national output in 1949, California second with 18.1 percent, Louisiana third with 10.4 percent, Oklahoma fourth with 8.3 percent, Kansas fifth with 5.5 percent, and Illinois sixth with 3.5 percent. Texas was the only State in the group to show a decline in the percentage of total output in 1949 compared with 1948.

The seven States next in importance produced 11.7 percent of the national output in 1949 compared with 11.3 percent in 1948. New Mexico, with static production, ranked as the seventh State in importance, while Wyoming dropped to eighth place owing to a sharp decline in production. Mississippi and Arkansas retained ninth and tenth places, even though production declined compared with 1948. Colorado was the only State in this group to show a gain in production and remained the eleventh producer, followed by Michigan and Pennsylvania.

The production of all other States rose from 1.8 percent of the national total in 1948 to 2.1 percent in 1949. The gain in production in Indiana from 7 million barrels in 1948 to 9.6 million in 1949 was the most notable increase while production in most other States declined.

[1] Preliminary figures.

Production by States

Alabama.—Crude production in 1949 totaled 462,000 barrels compared with 466,000 barrels the previous year, a decline of 4,000 barrels. There were 14 wildcat wells drilled during the year in 8 counties in southern Alabama; however, all were failures. Four oil wells were completed in the Gilbertown field, Choctaw County, which raises the producers to 39. Daily average production per well in the field is approximately 36 barrels, and cumulative production through December 1949 totals 1,927,548 barrels. Humble Oil & Refining Co. drilled the deepest well of the year in Washington County. It was dry and abandoned at 15,668 feet after hitting salt.

Arkansas.—Crude-oil output declined 5.5 percent in 1949 compared with 1948, when production dropped from 31,682 thousand barrels to 29,936 thousand barrels. This decrease was the result of an emergency order of the Arkansas Oil and Gas Commission issued in June, which reduced the top allowables for wells in controlled fields 15 percent. This order remained in effect until November 1, when the allowable was increased.

The Magnolia field, Columbia County, continued to lead all others in production, with an annual output of 4,292 thousand barrels in 1949. The Smackover field was second with 3,900 thousand barrels, the Schuler field third with 3,170 thousand barrels, and the Wesson field fourth with 2,638 thousand barrels.

During 1949, 321 wells were drilled representing a moderate gain over the previous year. Wildcat drilling declined from 106 wells in 1948 to only 78 in 1949. Adhering to the pattern of recent years, greatest activity was centered in southern Arkansas in Union, Ouachita, Nevada, and Columbia Counties. Three new oil fields, three new pools, and two producing zones were discovered during the year.

The most promising of the new discoveries are the Pine Tree field, Columbia County, and the Curry pool, Ouachita County. In the former field the discovery well flowed over 500 barrels daily from perforations at 8,426 to 8,433 feet opposite porous section of the Smackover lime topped at 8,412 feet. Two additional producers have been

completed in this field. The Curry pool, Ouachita County, was opened in July by a well drilled to the Travis Peak sand; the strike is 2½ miles north of production in the Stephens field. The well flowed over 400 barrels daily on official State test, producing from perforations at 3,608 to 3,620 feet. Subsequently five producers have been completed, most of them flowing or pumping over 100 barrels daily. Six dry holes have been drilled in the field.

California.—Oil production declined moderately in 1949 (2 percent) compared with 1948, when output decreased to 332,839 thousand barrels. Several factors contributed to the drop, one being shutting in 3,000 wells producing heavy crude in 22 fields. Another cause was the earthquake at Wilmington resulting in casing damage to many wells at or near the 1,700-foot subsea level. Many fields reported declines, with such major fields as Coalinga, Kettleman Hills, and Wilmington, dropping 7, 8, and 10 percent, respectively. However, Ventura Avenue, Huntington Beach, and the New Cuyama Group fields increased production.

Drilling activity likewise declined during the year, when 2,512 wells were drilled in contrast with 2,876 wells in 1948. The drilling effort resulted in 1,914 oil wells, 40 gas wells, and 558 dry holes. However, exploratory drilling attained a new record when 558 wells were drilled in 1949, or 100 more than during the preceding year; more than one-third of the exploratory drilling was in Kern County. This wildcatting resulted in the discovery of 3 new oil fields and 12 new oil zones in old fields. The most important new fields discovered during 1949 were Cuyama South and Placerita Canyon–Juanita area. The net result of wildcatting was disappointing as only 2.4 percent of exploratory wells were successful. With respect to reserves, Cuyama South is the first major field discovered since 1938. Placerita Canyon developed a high potential, which resulted in a large volume of oil being produced, but the reserve was greatly depleted during the first year of operation. The discovery well was completed in sec. 31–4–15, March 3, 1949, flowing 314 barrels daily of 22.2 gravity oil, total depth 1,831 feet. This well started a town-lot drilling campaign which was intensified during the fall by a decision of the Superior Court, which overthrew the well-spacing act and stimulated the drilling of 150 new wells. At the end of the year, 182 wells had been completed, with a pool production of 25,000 barrels daily.

Colorado.—Oil production soared to an all-time record in 1949, when output reached 23,934 thousand barrels, an increase of 35 percent or approximately 6.1 million barrels over the preceding year. The Rangely field was responsible for 6.0 million barrels of the increment. Fields which registered a loss in production during 1949 were Fort Collins-Wellington, Moffat, Walden, and Wilson Creek.

Drilling activity registered a sharp drop compared with 1948, as only 21 oil producers were completed contrasted with 149 the previous year. In spite of the decline in drilling, a lease campaign of major proportions progressed in the eastern part of the State. The outstanding strike of the year was a wildcat well drilled in Routt County, which found oil in a 29-foot sand between 6,670 and 6,699 feet in the lower Morrison horizon. Initial production was about 250 barrels daily of 38 gravity oil, and elevation is 9,000 feet above sea level on the Yampa anticline. The construction of a pipeline from the Rangley field to Salt Lake City, Utah, was instrumental in augmenting production in the field to an average of approximately 54,000 barrels per day.

[2] Preliminary figures.

Florida.—Oil production increased materially in 1949, with output of 441,000 barrels contrasted with 290,000 barrels the previous year. Three oil wells and one successful extension were completed in Collier County.

Exploration activity declined to 19 wells in 1949 compared with 24 wells the preceding year. The Sunniland field, Collier County, was responsible for the State's only production.

Illinois.—Crude production totaled 64,583 thousand barrels in 1949 compared with 64,808 thousand barrels the preceding year, indicating a decline of 0.3 percent. Among the fields recording gains were Albion, Centralia, East Inman, Robinson, and Sailor Springs. Losses were registered by the following fields—Boyd, Clay City, Johnsonville, Louden, Marine, New Harmony-Keensburg and Salem.

Drilling activity was maintained at a high tempo, with 2,706 wells completed; a breakdown reveals 1,392 oil wells, 6 gas wells, and 1,308 dry holes. Wildcat completions likewise increased in 1949, when 724 wells were drilled, of which 98 produced oil, 3 yielded gas, and 623 were failures.

[1] Includes Schnell.

Indiana.—The State made a sharp increase in oil production in 1949, when 9,556 thousand barrels were produced compared to 6,974 thousand barrels the preceding year, an increment of 37 percent.

Drilling activity was greatly accelerated during the year, when 1,276 wells were drilled in contrast with 1,077 wells in 1948. Likewise wildcat completions made a large gain totaling 471 and resulted in 62 oil wells, 7 gas wells, and 402 dry holes. In 1948 only 307 wildcat wells were drilled. Over half of the successful wildcat wells were drilled in three counties—Posey, Gibson, and Sullivan.

[1] Preliminary figures.

Kansas.—A substantial drop in production (9 percent) was recorded in 1949 compared with the preceding year. Oil output totaled 101,868 thousand barrels, contrasted with 110,908 thousand barrels in 1948. The decline resulted from proration orders of the Kansas Corporation Commission. There was no let-up in drilling activity, as 3,356 wells were completed compared with 3,252 in 1948. Likewise, wildcatting continued at a high tempo, with 522 completions; 89 produced oil and 9 gas, and 424 were classified as failures.

In accordance with the usual pattern of Kansas fields, most of the discoveries opened up small pools. Almost half of the best strikes were made in four counties—Barton, Ellis, Stafford, and Butler. However, the outstanding new pools of the year were the Berland in Rooks County, the Huffstutter in Phillips County, and the Davis Ranch in Wabaunsee County; their combined production totaled over 66,000 barrels during November.

Of particular significance among the year's discoveries was the new Rhodes pool in Barber County, where the fifth well drilled in the pool had an initial potential of 9,000 barrels daily.

Kentucky.—Production of 8,656 thousand barrels during 1949 reflected a 1.6-percent decrease from the previous year's output of 8,801 thousand barrels. Drilling activity for the State, as a whole, gained sharply in 1949 over 1948, evidenced by 1,043 wells drilled compared with 903 in 1948. This drilling resulted in 448 oil wells, 193 gas wells, and 402 dry holes.

In eastern Kentucky 186 wells were completed in proved territory; however, wildcatting in this part of the State met with no success. In western Kentucky, 346 oil wells were completed, including 29 wildcats. Greatest exploration activity was centered in Union, Daviess, Henderson, and McLean Counties.

[1] Preliminary figures.

Louisiana.—All previous production records were again shattered in 1949, when crude output totaled 190,715 thousand barrels, a 5-percent gain over the previous record of 181,458 thousand barrels established in 1948. This trend was in direct contrast to some other large producing States which sharply curtailed their production of petroleum. The Gulf Coast production was 146,322 thousand barrels, a 6-percent gain over 1948, while the rest of the State produced 44,393 thousand barrels, an increment of 2 percent.

In northern Louisiana, fields making the largest increases in production in 1949 were Caddo, Haynesville and Lisbon, whereas individual fields suffering the biggest losses were Big Creek, Delhi, Ora, and Rodessa. During the year 1,444 wells were drilled in northern Louisiana, resulting in 927 oil wells, 192 gas wells, and 325 dry holes. This compares with 1,550 wells drilled in 1948, of which 1,095 were oil wells. The number of wildcat wells drilled declined from 114 in 1948 to 106 in 1949, a continuation of the trend during recent years. Wildcat wells were responsible for the discovery of six new oil fields and several new oil pay horizons in old fields, as well as extensions of old fields.

Noteworthy was the discovery of Wilcox production in the east central part of the State in Catahoula, Concordia, and La Salle Parishes, where four new oil fields were discovered. Of paramount importance was the new West Catahoula Lake field, where 25 oil wells were completed without defining the limits of the field. The wells are producing from a depth of 4,000 feet, which has been conducive to a rapid development program. Also producing from the Wilcox

sand are the new Chaney Lake and Vidalia fields of Concordia Parish, where drilling operations are not sufficiently advanced to determine the field's possibilities. Of more than passing interest was the rapid development of production in the Pettit lime in the Lisbon field, Claiborne Parish. Successful drilling operations were continued in the Haynesville, East Haynesville, Ruston, and Hico-Knowles areas.

In the Gulf coast area, individual fields that made the largest gains in production were Bay St. Elaine, Caillou Island, David Haas, Delta Farms, Golden Meadows, Section 28, University, and Weeks Island. Losses were reported in the following fields: Anse la Butte, Eola, Gibson, Hackberry, Jennings, Paradis, and Quarantine Bay. During the year, 923 wells were drilled in the Gulf coast region, a 20-percent increase over 1948. The total includes 597 oil wells, 19 gas wells, and 307 dry holes. There were 175 wildcats drilled in 1949 in the area covered by the Houma, Lafayette, Lake Charles, and New Orleans districts of the Louisiana Conservation Department. These districts include the offshore leases in the Gulf of Mexico. Of the 175 tests, 70, or 40 percent, were successful, which established a very high percentage of discoveries. Of the 70 discoveries, 50 were made by major companies and 20 by independents and smaller companies according to the Oil and Gas Journal. New fields resulted from 39 of the 70 successful wells, with new pay zones in old fields making up the balance.

New field discoveries in the Gulf of Mexico totaled 13 during 1949, augmenting the State's reserves of crude oil and natural gas. Largest number of discoveries was made in Cameron, Vermilion, Terrebonne, Lafourche, Jefferson, Iberia, and Plaquemines Parishes, on the Gulf. In addition to the 13 new fields discovered offshore, these parishes also included 10 new fields on land.

South Louisiana is an area of deep drilling and high pressures, which explains the very high drilling costs. Offshore drilling is unusually expensive due to the expense involved in building drilling platforms and transporting all equipment, fuel, and supplies over the water. Operators have been very successful in discoveries in the Gulf, and the percentage of strikes is high compared with other areas. All of the prospects now being drilled are in salt-dome formations, which are fairly easy to locate with underwater geophysical equipment. However, only the most favorable prospects are being drilled at this time.

Outstanding are the exceptionally deep wells being drilled in southern Louisiana with marked success. To mention a few—an oil strike was made at a depth of 13,000 feet in Jefferson Parish, two new horizons were discovered near 14,000 feet in Iberia Parish, and a new 14,-400-foot field was located in the Gulf in Lafourche Parish.

[4] Includes Little Creek and Summerville.

Michigan.—The State's petroleum output totaled 16,495 thousand barrels in 1949, representing a 2-percent loss compared with the preceding year. Fields that increased production in 1949 were Beaver Creek and Pentwater, while losses were registered in the following fields: Coldwater, Deep River, Kimball Lake, and Reed City.

Drilling activity increased sharply in 1949 in comparison with the previous year; total completions equaled 925 wells, classified as follows: 426 oil wells, 23 gas well, and 476 dry holes. Of 344 wildcat completions, 28 struck oil, and 3 found gas. The leading counties were Allegan, Gladwin, and Van Buren, where over half the discoveries were made.

[1] Preliminary figures—estimated in part.

Mississippi.—The production of petroleum totaled 37,966 thousand barrels in 1949, compared with 45,761 thousand barrels the previous year, a drop of 17 percent. The principal oil fields, in order of their importance, are Tinsley, Mallalieu, Brookhaven, Cranfield, La Grange, Baxterville, and Heidelberg.

New wells drilled totaled 333, including 161 oil wells, 5 gas wells, and 167 dry holes. Wildcat completions totaled 115 wells, a slight gain over the 1948 total of 109 wells. Five oil fields and two gas-condensate fields were discovered during the year, all in southern Mississippi. According to reports, none of the strikes appeared to have major importance.

In Franklin County a strike was made by a well flowing 356 barrels of 43.8 gravity oil daily. The area has been named the Bude field. This well produced from a lower Tuscaloosa stringer sand at 11,090 to 11,098 feet. Six dry holes were drilled in the area, and by the end of 1949 only four wells were producing in the field.

A small strike was made by Humble Oil & Refining Co., in sec. 3, T. 4 N., R. 8 W., Greene County, in the southeastern part of the State. On initial test the well pumped 46 barrels per day of 24.6 gravity oil, producing from the lower Tuscaloosa sand at 7,804 feet to 7,812. It is the only well in the field.

In Adams County oil was found in the Wilcox sand at 6,465 to 6,469 feet in a wildcat well that gaged 360 barrels of 37 gravity oil per day. There are four producing wells in the field, which has been designated the Ellislie field.

[1] Preliminary figures.

Montana.—Crude production totaled 9,149 thousand barrels in 1949 compared with 9,382 thousand barrels the previous year, a decrease of 2.5 percent. Principal oil fields that reported declines in 1949 compared with 1948, showed the following output: Cut Bank 3.5 million barrels, Cat Creek almost ½ million barrels, and Kevin-Sunburst 1.6 million barrels. The Pondera field produced over ½ million barrels, a substantial gain over 1948.

Well completions totaled 279, which resulted in 138 oil wells, 54 gas wells, and 87 dry holes.

Exploration activity declined during the year, when 45 wildcats were drilled contrasted with 57 wildcats in 1948. Four new oil fields, one gas-condensate field, one new gas field, and one new oil pool in an established producing field were discovered during the year. Operators made a determined effort to locate Devonian reef production; however, no outstanding strikes were reported in the State.

[2] Preliminary figures.

Nebraska.—The production of crude oil increased to 330,000 barrels in 1949 in contrast with 215,000 barrels the previous year, a gain of 53 percent. Wildcat completions totaled 18, of which 3 were oil wells and 15 dry holes. In addition, seven oil wells were drilled in proved territory.

A leasing campaign of enormous proportions was carried on by several major oil companies in western Nebraska during the year. Outstanding was the strike of Ohio Oil Co. in its discovery of the Gurley field in Cheyenne County, southwestern Nebraska. The well [illegible] 225 barrels of 35 gravity oil per day from the first Dakota horizon at 4,401 to 4,429 feet. Five additional oil wells have since been completed in the field.

[1] Preliminary figures.

New Mexico.—The record crude production in 1948 was equaled in 1949, when output again totaled almost 48 million barrels. The major producing fields were as follows: Drinkard, Monument, Vacuum, Eunice, Hobbs, Brunson, and Maljamar.

In southeastern New Mexico well completions totaled 486, resulting in 334 oil wells, 48 gas wells, and 104 dry holes; 66 wildcat wells were drilled, resulting in 14 oil producers and 52 failures. An intensive wildcat campaign was carried on in Lea and Eddy Counties which resulted in the discovery of 13 new oil fields, 11 being in Lea County. These strikes added materially to the crude-oil reserves of New Mexico. The principal discoveries were very deep wells producing from the Devonian pay at 10,500 to 12,500 feet, also from the Pennsylvanian pay at 9,000 to 9,600 feet.

Of outstanding importance was the Amerada Petroleum Co.'s discovery well in sec. 2, T. 12 S., R. 33 E., Lea County, with an initial production of 1,744 barrels daily, producing from the Devonian at 10,950 feet to 10,965 feet.

In northwestern New Mexico a wildcat well of prime importance was reported to have discovered oil in the Dakota sandstone in sec. 20, T. 24 N., R. 2 W., Rio Arriba County.

The area formerly considered solely a natural-gas territory now has potentialities of oil production. This strike greatly accelerated leasing activity in the San Juan Basin. Although the well was not completed before the end of 1949, owing to a fishing job, preliminary tests indicate a 135-barrel well of 42.7 gravity oil producing from the second Dakota pay at 7,674 to 7,686 feet.

New York.—Oil production declined to 4,248 thousand barrels in 1949 compared with 4,621 thousand barrels the previous year, a drop of 8 percent. Completions for the year totaled 446 oil wells, all drilled in proved territory.

[1] Preliminary figures.

Ohio.—Crude production declined 4.6 percent in 1949 compared with the preceding year; 3,433 thousand barrels were produced contrasted with 3,600 thousand barrels in 1948. A reduction in the price of crude oil was responsible for a sharp decline in drilling activity. Well completions totaled 1,044, exclusive of service wells, compared with 1,522 wells in 1948. In all 349 oil wells and 308 gas wells were completed during 1949.

No discoveries of particular significance were made in Ohio during the year. Drilling activity was greatest in the following counties: Perry, Ashland, Monroe, Washington, Muskingum, Knox, and Athens. The year's largest oil well was the Preston Oil Co. No. 1 Albert, Perry County, total depth 2,922 feet, which produced 275 barrels from the Clinton sand the first 24 hours after shot. In the Corning area, two field extensions were made, which added several hundred acres of production to the pools, one in Jackson Township, Knox County, the other in Jackson Township, Muskingum County.

[1] Preliminary figures.

Oklahoma.—Oil production during 1949 dropped slightly; output totaled 151,902 thousand barrels contrasted with 154,455 thousand barrels in 1948, a 1.7 percent decline. Production gained in the Allen, Hewitt, Knox, Seminole City, Sholem-Alechem, Tatums and Witcher fields, whereas it decreased in the Apache, Burbank, Cement, Cumberland, Cushing, Healdton, Oklahoma City, Velma, and West Edmond fields.

There were 4,308 wells drilled in the State during 1949 compared with 4,263 the previous year, indicating a slight gain. Wildcat completions totaled 804, resulting in 163 oil wells, 18 gas wells, and 623 failures. The firm price structure for Oklahoma crude was maintained throughout the year, tending to stimulate exploration activity. This drilling resulted in the discovery of 77 new pools; however, many of these were small in extent.

[2] Includes Bayou.
[3] Includes Pearson.
[4] Includes Tussy.

Of major importance is the Elk City area, Beckham County, which was discovered in December 1948. The field is now producing 5,000 barrels daily, with 13 producers, and the proved area is 8 miles long and 3 miles wide at its maximum width. The field produces high-gravity oil, and it is reported that a major company will erect a large natural-gasoline plant in the area.

Intensive development work was carried on in McClain and Garvin Counties, where approximately 360 wells are producing in 5 fields. Garvin County led the State in number of wildcat producers with 20, while Stephens County was second with 11 and Major, Okfuskee, and Seminole Counties were responsible for 10 each.

Of particular significance was extension of the Ringwood field, Major County, in the Anadarko Basin, where 19 producers were drilled in 1949. The field is now 7 miles long, and the exact limits have not been determined. Important extensions were made to Velma, Sholem-Alechem, and North Alma fields in Stephens and Carter Counties.

The development of new producing horizons in old fields of east central Oklahoma was noteworthy; good wells were completed in the Olive district and the South Slick pool of Creek County. A strike was made in Love County, southern Oklahoma, when a 200-barrel well was completed in sec. 36, T. 6S., R. 2E., flowing from 6,500-foot Pennsylvania sands. This well was responsible for an active leasing campaign in the county.

In Hughes County a wildcat well in sec. 14, T. 8N., R. 8E., was successful in opening up the Benjamin field by producing from the Cromwell sand at 3,303 to 3,312 feet; however, the extent of the field is unknown.

Pennsylvania.—Crude production decreased 10 percent during the year; output declined to 11,374 thousand barrels contrasted with 12,667 thousand barrels in 1948. A material decrease in drilling activity was registered, as evidenced by completion of 1,223 wells in 1949 contrasted with 1,889 wells the preceding year. The year's total included 956 oil wells, 215 gas wells, and 52 failures. No new oil fields were discovered during the year.

[1] Preliminary figures.

Tennessee.—Oil production in 1949 increased slightly from the previous year's total of 19,000 barrels; however, drilling activity declined somewhat from the 1948 level. Crude oil was produced from six counties in the north and northeast-central part of the State.

Forty-seven wells were drilled during the year, 8 of which were successful. Two of these were wildcats and are producing from the Silurian in Sumner County; one was a new pool extension now producing from the Upper Stones River in Clay County, and the other five, also classed as new pool extension wells, are producing from the Chester in Morgan County. The second-deepest well ever drilled in Tennessee was Stephens Petroleum Co.'s deep test in McNairy County, reported to have been drilled to 5,280 feet; however, it was plugged in July.

Texas.—Crude production totaled 743,990 thousand barrels in 1949 compared with 903,498 thousand barrels the previous year, a drop of 159,508 thousand barrels, equivalent to 17.6 percent. Texas had the distinction of the largest decline in production of any of the States, as well as the greatest percentage decrease. This drop in crude output was due to the monthly proration orders of the Texas Railroad Commission. All districts except the Panhandle reported a substantial loss in production. Percentage losses in 1949 compared with 1948 were as follows: Gulf coast 24 percent, west Texas 16 percent, east Texas 19 percent, and rest of State 15 percent.

Drilling activity was maintained at a high level during 1949, when 13,619 wells were drilled in contrast with 12,172 wells the previous year. The most active district was west Texas, with 3,258 wells, while north central Texas was second with 2,571 and the Gulf coast third with 1,980.

Gulf Coast.—Crude production in the Gulf coast suffered the sharpest drop of any district in the State when output fell to 208,701 thousand barrels in 1949 compared with 274,440 thousand barrels in 1948, a 24-percent decrease. Oil fields reporting moderate gains in 1949 were Bloomington, Chocolate Bayou, Dyersdale, High Island, Hull, and Pierce Junction. Individual fields having large losses were Agua Dulce, Anahuac, Conroe, Friendswood, Hastings, Stratton, Thompson, West Ranch, and White Point.

During the year 1,980 wells were drilled, including 1,103 oil wells, 182 gas wells, and 695 dry holes. The number of wells drilled exceeded the 1948 total by approximately 100 wells, about evenly divided between oil and gas wells. Exploratory wells totaled 531 and resulted in 109 oil wells, 46 gas wells, and 376 dry holes. Notwithstanding the large number of strikes made during the year, the majority had minor significance. The East Village Mills oil field, Hardin County, appeared to be outstanding among the year's discoveries. It is producing from the Wilcox sand at approximately 7,000 feet, and the field is being rapidly drilled by 17 producers.

Of possible major importance is the New Ulm area in Austin County, where not only gas condensate has been found but also oil. The production is of dual-sand character, and the prospects are promising for Wilcox production on what is reportedly a very extensive structure.

[1] Preliminary figures.
[2] Includes crude oil consumed on leases and net change in stocks held on leases for entire district.
[3] Joiner, Kilgore, Lathrop, and other pools in Cherokee, Gregg, Rusk, Smith, and Upshur Counties.
[4] Includes other fields in Falls, Freestone, Limestone, and Navarro Counties.
[5] Includes the fields in and between Wilbarger, Wichita, Clay, Montague, and Cooke Counties on the north and Runnels, Coleman, Brown, and Comanche Counties on the south.
[6] Includes crude oil consumed on leases and net change in stocks held on leases for east (exclusive of East Texas proper) central, north, and south Texas.
[7] Carson, Gray, Hutchinson, Moore, and Wheeler Counties.
[8] Includes fields in Brooks, Duval, Hidalgo, Jim Hogg, Jim Wells, La Salle, Live Oak, McMullen, Starr, Webb, and Zapata Counties.
[9] Includes the part of Jordan pool in Crane County.

East Texas.—Petroleum production declined to 138,317 thousand barrels in 1949 contrasted with 171,694 thousand barrels in 1948, a decrease of 19 percent. With the exception of the New Hope field, production in all of the other fields dropped in 1949; the largest decrease occurred in the East Texas field, with a drop of over 18 million barrels. Other fields showing big declines were Hawkins, Quitman, Talco, and Van.

Drilling activity increased phenomenally during 1949, when 1,107 wells were drilled compared with 629 wells the previous year. Wildcat completions numbered 186 in contrast with 147 in 1948. There were 17 new oil strikes and 4 gas discoveries during the year. No outstanding discoveries were made in East Texas in 1949; however, Wood County led the district with three strikes, and Smith County was next with two successful wells.

Central Texas.—Oil production totaled 16,999 thousand barrels in 1949 compared with 18,732 thousand barrels in 1948, a decrease of 9 percent. The Charlotte field gained in output during the year, but there were declines in most other fields, including Falls City and Mexia-Powell. The district experienced intensified exploration activity during 1949, when 592 wildcat wells were drilled, resulting in 93 oil wells, 15 gas wells, and 484 dry holes. The most active counties were Throckmorton, Stephens, Coleman, Shackelford, and Jones.

North Texas.—Crude production amounted to 69,764 thousand barrels in 1949, which is almost identical to the preceding year's output of 69,951 thousand barrels. This district showed no signs of diminution in drilling activity during the year. Wildcat completions numbered 475, resulting in 83 oil wells, 6 gas wells, and 386 dry holes. The largest number of strikes was recorded in Archer County, with Jack and Young Counties tied for second place. Noteworthy were two discoveries in Jack County which produced 40 gravity sweet crude and apparently opened fields of considerable possibilities.

Panhandle.—Crude production increased to 33,019 thousand barrels in 1949 compared with the previous year's output of 31,725 thousand barrels, representing a 4-percent gain. The Panhandle was the sole district in the State where production increased in 1949.

Drilling activity in proved areas continued without abatement during the year and established a large gain over 1948. In all, 959 wells were drilled; 580 produced oil and 310 gas, and 69 were failures. No new discoveries of consequence were made during the year.

South Texas.—Oil production in 1949 was 47,764 thousand barrels contrasted with 62,096 thousand barrels the previous year, a decline of 23 percent.

Exploration activity was accelerated when 645 wildcats were drilled, which resulted in 74 oil wells, 34 gas wells, and 537 dry holes. The largest number of discoveries was made in Duval, Nueces, Starr, Brooks, Caldwell, and Frio Counties. No field of major importance was uncovered in the district; but many strikes were made, some of which have distinct possibilities. Of particular interest was the Clayton gas-condensate field, and reports indicate that it may develop into a major producing area. Eighteen wells were drilled in the London Gin field of Nueces County, which rated high in rapid development because of comparatively easy drilling. Many new pay zones were found, as well as extensions of old fields which opened up considerable additional proved territory.

West Texas.—Oil production declined 16 percent in 1949 contrasted with 1948, totaling 229,426 thousand barrels against 274,860 thousand barrels, a direct reversal of the trend during the preceding year. The counties responsible for the largest output were Andrews, Crane-Upton, Ector, Gaines-Yoakum, Hockley, Pecos, and Winkler.

Intensive drilling activity was responsible for a record number of wells being drilled in the area. Completions totaled 3,258 wells, resulting in 2,788 oil producers, 24 gas wells, and 446 failures. Wildcat wells numbered 343 and were responsible for 63 oil strikes, 6 new gas wells, and 274 dry holes.

Greatest activity was centered in Crockett, Gaines, Pecos, Runnels, Tom Green, and Scurry Counties. The outstanding discovery of the

year was the finding of reef oil in four new fields in Scurry County; moreover, the limits of these fields had not been defined by the end of 1949, although it was reported that a billion barrels of additional reserves had been discovered. Approximately 200 producing oil wells were completed during the year, and the exploration activity had been extended into Borden and Kent Counties. Reports indicate that the new fields may be joined, forming one enormous field 25 miles or more in length.

Utah.—Crude petroleum produced during the year amounted to approximately 613,000 barrels from three fields, the major production being from the Ashley Valley. The Roosevelt and Boundary Butte fields had less importance. A total of 49 wells was drilled in the State, including 25 oil wells and 1 gas producer.

A notable strike was the wildcat drilled in Uintah County by Carter Oil Co., which flowed over 1,600 barrels daily of 32.6 gravity oil from Tertiary formation at a total depth of 9,392 feet, with the top of the sand at 9,351. Production has been held to 600 barrels per day through choke, and pressure has remained constant.

Virginia.—The State output gained 10,000 barrels in 1949, when 43,000 barrels of crude oil were produced compared with 33,000 barrels in 1948. No development completions were made during the year, however, three wildcats were drilled, of which one was a gas well and the other two were failures.

West Virginia.—A moderate increase of 5 percent in crude production was made in 1949, when output totaled 2,839 thousand barrels compared with 2,692 thousand barrels the preceding year. In all, 518 wells were drilled during the year, classified as follows: 344 gas, 87 oil, and 87 dry holes.

The Silverton field, Jackson County, continued to maintain its position as the most active area for oil production in the State. Twenty-four oil wells were completed, averaging 15 barrels daily initial production, the average depth being 2,589 feet.

Wyoming.—Oil production declined sharply in 1949 to 46,935 thousand barrels compared with 55,032 thousand barrels the previous year, a drop of 15 percent. Decreases were largest in the following fields: Big Sand Draw, Byron-Garland, Little Buffalo, Frannie, Hamilton Dome, Oregon Basin, Salt Creek, Steamboat Butte, and Winkleman.

Drilling activity continued at a high level during 1949, when 587 wells were drilled; a breakdown indicates the following: 322 oil wells,

8 gas wells, and 257 dry holes. In all, 131 exploratory wells were drilled, twenty-one of which were successful. The largest number of discoveries was made in Weston, Hot Springs, and Fremont Counties. Operators made a determined effort to locate oil in sands of Cretaceous age in the Powder River Basin, and their efforts were rewarded with eight discoveries. The oil is of high gravity, approximately 40°.

The outstanding drilling feat of the year was performed by the Superior Oil Co. in its Pacific Creek wildcat in Sublette County, which was drilled to a record depth of 20,521 feet in the Frontier sands of Cretaceous age. Although some gas shows were encountered, the well was finally abandoned.

WELLS

A record number of wells—37,656—was drilled in the United States during 1949 contrasted with 37,508 wells the previous year. Both totals include oil wells, gas wells, and dry holes. A generally firm price for crude oil throughout the year tended to maintain drilling operations at a high level.

Oil-well completions declined from 22,585 in 1948 to 22,042 in 1949, while the number of gas wells remained virtually constant, with 2,887 completions in 1949 compared with 2,897 the preceding year. Dry holes increased to 12,727 against 12,026 in 1948. Oil-well completions represented approximately 59 percent of the total wells drilled in 1949, dry holes comprising 34 percent and gas wells about 7 percent.

Texas led all States in number of wells drilled, with 13,619; Oklahoma was second with 4,308 wells and Kansas third with 3,356 wells.

By the end of 1948, there were 437,880 producing wells in the United States, with a daily average production per well of 12.8 barrels. Mississippi had the distinction of being in first place, with a

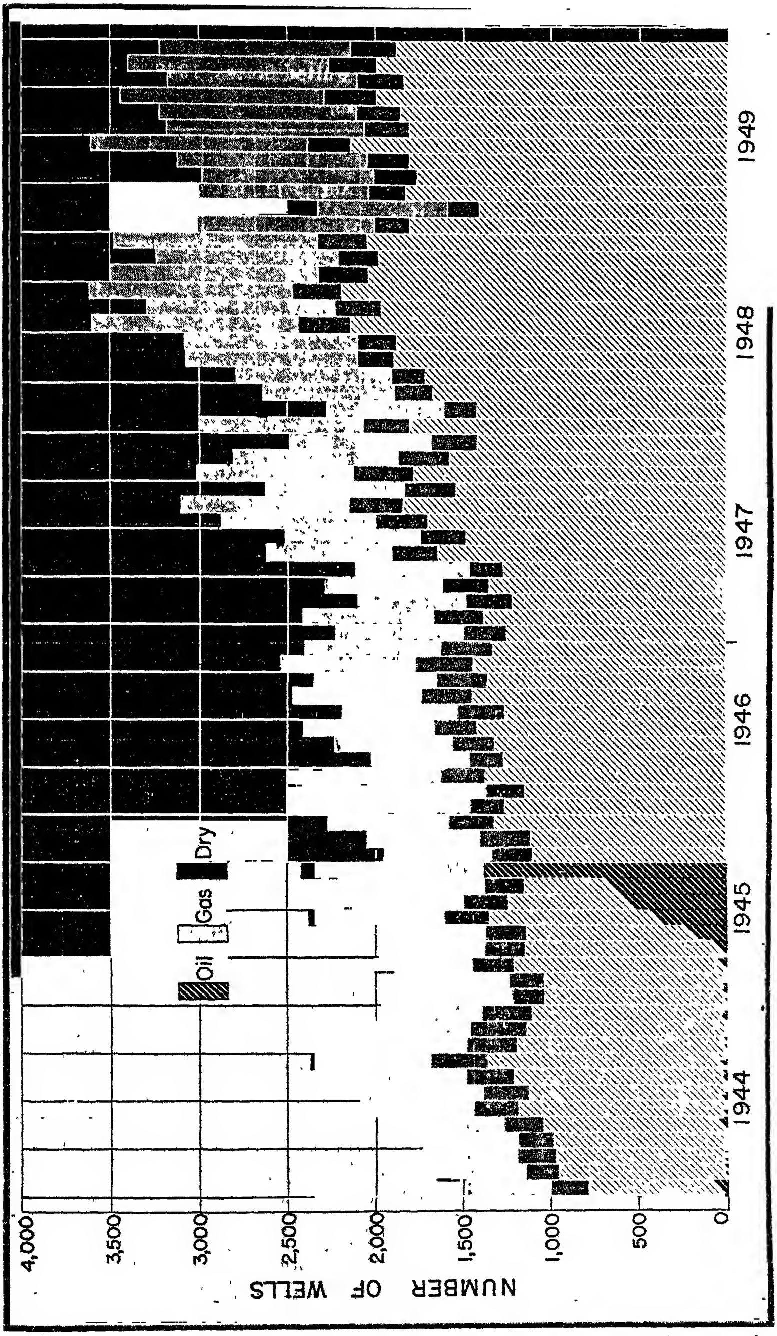

FIGURE 4.—Wells drilled in the United States, 1944–49, by months.

daily average production per well of 102.5 barrels, while the Louisiana Gulf Coast district was second with 93.3 barrels and Colorado next with 75.1 barrels.

CONSUMPTION AND DISTRIBUTION

The indicated total demand for crude oil was 1,998.5 million barrels in 1949, a daily average decrease of 5.6 percent compared with 1948. The daily average production of crude oil declined 8.7 percent, the average amount imported rose 20.4 percent, and 3.3 million barrels were withdrawn from crude storage. Stocks of refined products were reduced 0.8 million barrels during the year. Crude supply and demand were thus in close balance in 1949, and a major part of the relative decline in crude-oil demand was due to the inflated demand for crude in 1948 (which resulted in the addition of 79.8 million barrels to stocks of refined products), as well as to the small decline in the total demand for all oils in 1949.

The indicated demand for domestic crude oil declined from 1,998.4 million barrels in 1948 to 1,842.5 million in 1949, a daily average decrease of 7.5 percent. The indicated demand for foreign crude oil increased from 124.9 million barrels in 1948 to 156.0 million in 1949, a daily average gain of 25.1 percent. The demand for foreign crude oil represented 5.9 percent of the total demand in 1948 and 7.8 percent in 1949.

The total demand for crude oil in 1949 included 1,945.5 million barrels of crude runs to stills at refineries or 97.3 percent of the total, and 53.0 million barrels of all other crude used, or 2.7 percent of the total. Because of the new method used in 1949 of reporting crude in California, involving a shift of a considerable part of the crude oil formerly reported as transfers to residual fuel oil to runs to stills at refineries, these percentages are not comparable with preceding years. Crude exports declined from 39.7 million barrels in 1948 to 33.1 million in 1949.

[1] Preliminary figures.

Runs to Stills.—To compare crude runs in 1949 with 1948, the figures for 1948 have been adjusted to the new basis used for California in 1949 by adding 17.3 million barrels to the original 1948 runs for California and the national total. On this new basis, total crude runs in 1949 amounted to 1,945.5 million barrels, or 5,330,000 barrels daily, as compared to 2,048.3 million barrels, or 5,597,000 barrels daily, in 1948—a total decline of 4.8 percent, including a decline of 5.4 percent for the districts east of California and a decline of 1.8 percent for the California district. The total decline in crude runs in 1949 was 102.8 million barrels, including declines of 40.2 million in the Texas Gulf district, 36.9 million in the East Coast district, 10.6 million in the Texas Inland district, 10.0 million in the Oklahoma-Kansas district, 6.6 million in the California district, 2.3 million in the Arkansas-Inland Louisiana district, 1.5 million in the Louisiana Gulf district, and 1.1 million barrels in the Appalachian district. The only increases were 4.7 million barrels in the Rocky Mountain district and 1.7 million in the Indiana-Illinois district.

Distribution.—The demand for domestic crude petroleum in 1949 amounted to only 1,842.5 million barrels or 5,048,000 barrels daily, a decline of 7.5 percent compared with 1948. The decrease in total demand for all oils, the gain in total imports, the increase in the production of light oils from natural gas, and a small reduction in stocks of crude and products all contributed to this decline. The demand for domestic crude oil was met by a production of 1,840.3 million barrels in 1949 and a decline of 2.2 million barrels in stocks of domestic crude oil. The supply of domestic crude oil was supplemented by a consumption of 156.0 million barrels of foreign crude—a gain of 31.0 million barrels compared with 1948. Imports of refined products, mostly residual fuel oil, increased from 59.1 million barrels in 1948 to 79.2 million in 1949. Stocks of refined products decreased 0.8 million barrels compared with the increase of 79.8 million in 1948. The production of natural gasoline and other light liquids increased from 147.1 million barrels in 1948 to 156.4 million in 1949.

The Bureau of Mines collects data relating to the receipts of domestic and foreign crude petroleum at refineries in the United States. These receipts provide the crude for total runs to stills at refineries, for small amounts of crude used as refinery fuel, and for any increase in crude stocks at refineries. Classification of the receipts by States of origin shows the amount received from local production (intrastate), the receipts from other States (interstate), and receipts of imported crude. The classification of receipts by methods of transportation indicates the final receipts by boat, pipeline, or tank cars and trucks. The receipts of domestic crude by boat were in most instances originally moved by pipeline from the point of production to the point of shipment by boat.

Receipts of domestic and foreign crude petroleum at refineries amounted to 1,945.5 million barrels in 1949 and, supplemented by a reduction of 3.5 million barrels in crude stocks at refineries, provided for total crude runs of 1,945.5 million barrels and crude used as fuel and losses of 3.5 million barrels. Receipts of foreign crude oil amounted to 154.9 million barrels or 7.9 percent of the total, interstate receipts of domestic crude oil were 722.9 million barrels or 37.2 percent

[1] Preliminary figures.
[2] Missouri, Tennessee, and Virginia.

of the total, and intrastate receipts of 1,067.7 represented 54.9 percent of the total.

Refinery receipts of crude petroleum in 1949, by methods of transportation, indicated that 73.7 percent of the total was delivered by pipelines, 24.6 percent by boat, and 1.7 percent by tank cars and trucks.

Total deliveries to refineries by boat were 478.9 million barrels in 1949. The delivery of foreign crude totaled 154.9 million barrels, of which 136.5 went to the East Coast district, 17.4 million to the Texas Gulf Coast district, and 1.0 million to the California district. The interstate movement of domestic crude oil by boat amounted to 211.8 million barrels in 1949, including 140.0 million shipped from the Gulf coast to the east coast, 53.5 million of exchanges by boat between the Texas Gulf and Louisiana Gulf coast ports, and 18.1 million covering river shipments to Kentucky refineries. The intrastate deliveries by boat amounted to 112.2 million barrels in 1949, including 50.6 million in California, 32.5 million in the Louisiana Gulf, 25.7 million in the Texas Gulf, and 3.4 million in Kentucky.

Total receipts by tank cars and trucks in 1949 amounted to 32.8 million barrels, including 17.4 million intrastate and 15.4 interstate. The largest intrastate movements were 3.9 million barrels in California, 3.7 million in the Texas Gulf, 1.7 million in Wyoming, 1.6 million in Michigan, and 1.2 million in Kansas. The principal interstate movements were 3.6 million barrels to Illinois, 2.9 million to the Louisiana Gulf, 1.5 million to Inland Louisiana, 1.4 million to the Texas Gulf, and 1.3 million to Kentucky.

TABLE 37.—**Receipts of crude petroleum at refineries in the United States, 1945–49, by methods of transportation**

[Millions of barrels]

Method of transportation	1945	1946	1947	1948	1949 [1]
By boat:					
Intrastate	94.1	96.7	108.5	120.9	112.2
Interstate	113.3	226.2	241.0	265.1	211.8
Foreign	74.3	86.1	97.5	129.1	154.9
Total by boat	281.7	409.0	447.0	515.1	478.9
By pipelines:					
Intrastate	913.7	888.9	912.9	984.7	938.1
Interstate	454.2	401.4	449.7	490.0	495.7
Total by pipelines	1,367.9	1,290.3	1,362.6	1,474.7	1,433.8
By tank car and truck:					
Intrastate	15.2	20.1	19.9	24.0	17.4
Interstate	59.1	17.8	26.1	32.8	15.4
Total by tank car and truck	74.3	37.9	46.0	56.8	32.8
Grand total	1,723.9	1,737.2	1,855.6	2,046.6	1,945.5

[1] Preliminary figures.

Total receipts of crude oil at east coast refineries declined from 321.7 million barrels in 1948 to 280.2 million in 1949. Receipts of foreign crude oil increased from 123.6 million barrels in 1948 to 136.5 million in 1949, while total receipts of domestic crude declined from 198.1 million in 1948 to 143.7 million in 1949. The receipts of domestic crude oil included 140.0 million barrels by interstate boat movements, 3.3 million by pipeline from the Appalachian district, and 0.4 million by tank cars, and trucks. Receipts by interstate boat movements included 116.9 million barrels from Texas and 17.7 million from Louisiana. The total receipts of domestic crude oil in the East Coast district declined 54.4 million barrels in 1949 compared with 1948, including a decline of 55.2 million from Texas and a gain of 7.2 million from Louisiana.

The demand for domestic crude oil in 1949 totaled 1,842.5 million barrels, compared with 1,998.4 million in 1948, a decline of 155.9 million or 7.5 percent on a daily average basis. The comparison must be in daily averages because of the extra day in 1948. Of the 19 States with an annual demand of over 1 million barrels in 1949, only five States showed increases compared with 1948, including Louisiana with 10.0 million barrels, Colorado with 6.5 million, Illinois with 3.9 million, Indiana with 2.9 million, and West Virginia with 0.3 million. The major declines in demand were 146.1 million barrels for Texas, 8.0 million for California, 7.3 million for Mississippi, 6.7 million for Kansas, 5.7 million for Wyoming, 2.9 million for Oklahoma, and 1.5 million for Arkansas. The principal factors causing the decreased demand for domestic crude oil were the small decline in the total demand for all oils, the downward adjustment of refined products, and the decline in total exports and the gain in total imports. The demand for crudes high in lubricants was affected by the sharp drop in the total demand for lubricating oils, and the demand for heavy crudes was depressed because of the low demand for residual fuel oil, particularly for railroad use.

TABLE 33.—Daily average demand for total crude petroleum in the United States in 1948–49, by States of origin and by months

[1] Preliminary figures.

The market demand for Texas crude oil declined from 898.2 million barrels in 1948 to 752.1 million in 1949, a decline of 146.1 million or 16.0 percent on a daily average basis. Stocks of Texas crude oil decreased 8.1 million barrels in 1949. The relative contribution of Texas to the total demand for domestic crude oil declined from 45.0 percent in 1948 to 40.8 percent in 1949. The deliveries of Texas crude oil to refineries in the United States declined 137.4 million barrels in 1949, including decreases of 64.4 million to Texas refineries, 55.2 million to east coast refineries, 14.5 million to Louisiana refineries, and 5.6 million to refineries in the Oklahoma-Kansas district. There was no change in total deliveries to the Indiana-Illinois district and a gain of 2.4 million barrels to the Appalachian district. The low demand for Texas crude oil in 1949 was due to a decline in total demand for all oils, particularly in exports; to sharp declines in total crude runs in Texas and the east coast due, in part, to excess stocks of refined products; to the increase in imports of crude oil and products in areas served by Texas crude oil; and to a better-maintained market for crude oil in some of the States competing with Texas.

California ranked second as a source of crude-oil supply in the United States, with a market demand of 328.5 million barrels in 1949 compared with 336.6 million in 1948, a decline of 8.1 million or 2.1 percent on a daily average basis. California supplied 17.8 percent of the total demand for domestic crude oil in 1949 compared with 16.8 percent of the total in 1948. Stocks of California crude oil increased 4.3 million barrels in 1949. Stocks of refined products in the Pacific coast area rost 13.5 million barrels in 1949 compared with a gain of 12.7 million in 1948. Excess supplies of products led to the shipment of 7.6 million barrels to the east coast in 1949 compared with shipments of 2.1 million in 1948. The major part of the increase was residual fuel, the local demand for which had been cut by a sharp drop in railroad purchases. The increased competition of natural gas has been a further factor affecting the demand for California oil.

Louisiana was the third largest source of domestic crude oil in the United States, supplying 10.3 percent of the total demand in 1949 compared with 9.0 percent in 1948. The demand for Louisiana crude oil rose from 179.4 million barrels in 1948 to 189.4 million in 1949, a gain of 10.0 million or 5.9 percent. Stocks of Louisiana crude increased 1.3 million barrels in 1949, compared with a gain of 2.0 million in 1948. Total deliveries to refineries of Louisiana crude amounted to 182.0 million barrels in 1949, including intrastate deliveries of 89.3 million and interstate deliveries of 92.7 million. The principal shipments to other States included 61.8 million barrels to Texas refineries, 17.7 million to east coast refineries, and 10.0 million to the Indiana-Illinois district.

Oklahoma ranked fourth in supplying the demand for domestic crude oil in 1949, furnishing 8.2 percent of the total compared with 7.7 percent in 1948. The total demand for Oklahoma crude oil declined from 153.7 million barrels in 1948 to 150.8 million in 1949, a decrease of 1.6 percent on a daily average basis. Stocks of Oklahoma crude oil rose 1.1 million barrels in 1949. Deliveries to refineries in 1949 totaled 134.5 million barrels, including 61.4 million to refineries

within the State, 57.9 million to the Indiana-Illinois district, 8.2 million to other States in the Oklahoma-Kansas district, 3.6 million to the Appalachian district, 2.6 million to Texas refineries, and 0.8 million to New Jersey.

Kansas ranked fifth as a source of domestic crude oil in 1949. Demand for Kansas crude declined from 109.6 million barrels in 1948 to 102.9 million in 1949, a decrease of 6.7 million or 5.9 percent on a daily average basis. Kansas crude-oil stocks were reduced 1.0 million barrels in 1949 compared with a gain of 1.3 million in 1948. Total deliveries to refineries amounted to 93.3 million barrels in 1949, including 52.1 million to refineries in the State, 31.3 million to the Indiana-Illinois district, and 9.8 million to Oklahoma and Missouri refineries.

Illinois ranked sixth in importance as a source of crude oil in 1949, supplying 3.5 percent of the total demand for domestic crude oil compared with 3.1 percent in 1948. Demand rose from 61.5 million barrels in 1948 to 65.4 million in 1949, a daily average gain of 6.4 percent. Total deliveries to refineries amounted to 61.3 million barrels in 1949, including 21.4 million to refineries in the State, 25.0 million to the other States in the Indiana-Illinois district, and 14.9 million to the Appalachian refineries. Stocks of Illinois crude were reduced 0.8 million barrels in 1949 compared with an increase of 3.3 million in 1948.

New Mexico replaced Wyoming as the seventh State in importance in supplying crude oil in 1949, increasing the demand for its crude oil from 2.4 percent of the national total in 1948 to 2.6 percent in 1949. Stocks of New Mexico crude increased 0.6 million barrels in both 1948 and 1949. The demand for New Mexico crude oil was 47.4 million barrels in both years but gained 0.2 percent in daily average. Only 3.4 million barrels were used by refineries in the State in 1949. The principal outside markets were in Texas and Illinois refineries.

The next three States in order of importance as a source of domestic crude oil in 1949 were Wyoming with 2.5 percent of total demand, Mississippi with 2.1 percent, and Arkansas with 1.6 percent of the total. Compared with 1948, the demand for Wyoming crude decreased 10.6 percent, for Mississippi crude 15.7 percent, and for Arkansas crude 4.3 percent. The demand for the heavy crudes produced in these States fell because of the decline in the demand for residual fuel oil in 1949.

The demand for Colorado crude oil representing 1.3 percent of the national total in 1949 compared with 0.9 percent in 1948, increased from 17.3 million barrels in 1948 to 23.8 million in 1949, a gain of 6.5 million or 37.8 percent. Improved pipeline facilities and the increase in refinery capacity in Utah permitted a major increase in the amount of crude oil marketed in 1949.

Compared with 1948, the demand for Michigan crude oil showed no change in 1949, the demand for Pennsylvania crude continued the slow decline since 1947, the demand for Indiana crude increased 42 percent, the demand for Montana crude decreased over 2 percent, and the demand for Kentucky crude declined 6 percent.

STOCKS

Changes in the stocks of all oils are an essential indication of the relation between supply and demand. The increase of 107.1 million barrels in the stocks of all oils in 1948, including gains of 26.0 million in crude stocks and 81.1 million in other stocks, was initiated after the temporary and local shortages during the cold weather in the first quarter of the year and was accentuated by a smaller demand for all oils than had been expected in the latter part of 1948. Abnormally mild weather continued during the first quarter of 1949 and reduced the demand for heating oils and kept stocks at refineries, bulk terminals, and those held by distributors and consumers at abnormally high levels. As a result, refinery operations were cut sharply in the second quarter of 1949; and in the fourth quarter, total crude runs were 115,000 barrels daily below the rate in the first quarter.

Stocks of all oils totaled 602.9 million barrels on December 31, 1949, compared with the new basis of 605.7 million on the first of the year. The decrease of 2.8 million barrels during the year included a decline of 3.3 million in total stocks of crude oil, a gain of 1.3 million in stocks of natural gasoline, and a decrease of only 0.8 million in stocks of refined products.

The change in crude stocks in 1949 represented a decline of 2.2 million barrels in domestic crude stocks and a decline of over 1.0 million in foreign crude stocks. The principal declines in domestic crude stocks by States of origin were 8.1 million barrels for Texas, 1.0 million for Kansas, and 0.8 million for Illinois. The largest gains were 4.3 million barrels for California, 1.3 million for Louisiana, and 1.1 million for Oklahoma.

The decline of only 0.8 million barrels in stocks of refined products in 1949 included gains of 8.1 million in stocks of finished gasoline and 3.8 million in stocks of distillate fuel oil and declines of 3.8 million for residual fuel oil and 3.1 million for kerosine stocks.

Total refined stocks in the California district increased 13.5 million barrels in 1949 and declined 14.3 million in districts east of California. The excess of product stocks in the Pacific coast led to a substantial gain in shipments of surplus products from this area to the eastern United States via the Panama Canal.

TABLE 41.—Stocks of crude petroleum, natural gasoline, and refined products in the United States at end of year, 1945–49

[Thousands of barrels]

Product	1945	1946	1947	1948	1949 [1]

[1] Preliminary figures.
[2] Excludes 10,055,000 barrels of California heavy crude.

PRICES AND VALUE

The average value of crude petroleum at the well, as reported in the annual survey of the Bureau of Mines, rose from \$1.41 per barrel in 1946 to \$1.93 per barrel in 1947 and to \$2.60 per barrel in 1948. The results of the 1949 survey are not yet available, but the average value at the well in 1949 is estimated at \$2.54 per barrel. In the preliminary estimate of the average value per barrel of crude at the well in 1949, consideration has been given to the fact that the decline in the production of lower-priced heavy crudes was relatively much greater than for the lighter crudes.

The average value of crude oil at the well varies considerably with the quality of the oil and the distance from the market. The highest-value crudes are those in the Appalachian district due to their high content of lubricating oils. The value of crude from the Illinois Basin is well above the national average because of quality and nearness to refinery and product markets. The value of crude oils in Oklahoma and Kansas generally closely approximates the national average, good quality being somewhat offset by longer distances to market. The average value of Texas crude approximates the national average but includes a wide range of values due to variations in quality and location.

The main changes in posted prices for crude at the well in 1949 related to further declines for Pennsylvania Grade crudes and general cuts for heavy crudes. The sharp drop in the total demand for lubricants in 1949 affected the former and the decline in the demand for residual fuel oil, accompanied by reduced residual prices and increased imports, resulted in lower prices and a large decline in the demand

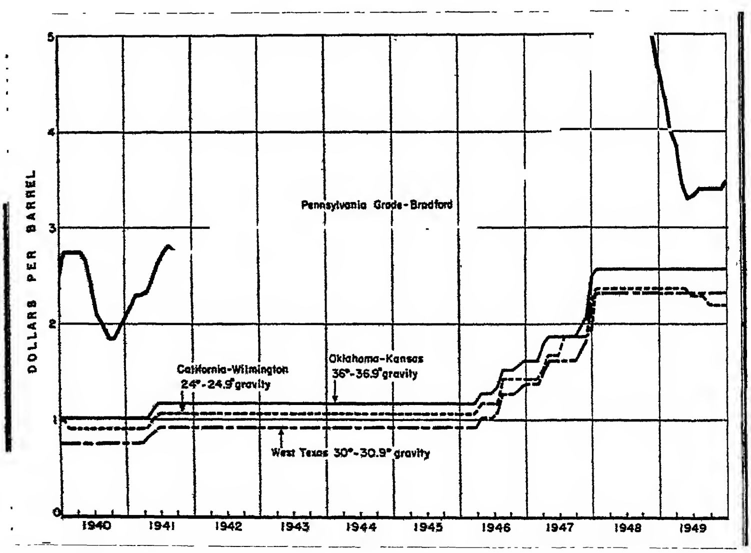

FIGURE 5.—Posted prices of selected grades of crude petroleum in the United States, 1940–49, by months.

for heavy crudes. The rapid decline in the consumption of residual fuel oil by railroads has affected the demand for heavy crudes over a wide area, from Texas to California.

The posted prices for the Bradford and Allegany districts illustrate the trend for Pennsylvania Grade crudes. The posted prices for this district remained at $5 per barrel in 1948 until reduced on December 11, to $4.50 per barrel. Starting at this price on January 1 it was cut to $4 on January 21, reached a low of $3.27 by May 11 and was increased to $3.40 on June 6 and to $3.54 per barrel on December 12.

Reductions shown in the posted prices of representative heavy crudes in 1949 range from 58 cents per barrel for Midway-Sunset crude in California, 25 cents per barrel for Smackover crude in Arkansas, 13 cents for Elk Basin crude in Wyoming, and 10 cents per barrel for Duval-Mirando crude in South Texas. The Independent Petroleum Association of America estimates an average reduction in 1949 for six representative heavy crudes of 22 cents per barrel.

REFINED PRODUCTS

GENERAL REVIEW

The total demand for all oils averaged 6,120,000 barrels daily in 1949, a decrease of 0.4 percent compared with 1948. This demand was depressed several percent below normal expectations owing to unusually mild weather in the first and last quarters of 1949, a sharp decline in the rate of industrial operations during the middle of the year, large stocks held over by consumers and distributors that decreased new purchases, and by a material decline in total exports. The production of refined products was far below the 1948 level, as shown by a sharp drop in total crude runs to stills. The supply of products was inflated above requirements in 1948 by an increase of almost 80 million

barrels in stocks of refined oils in 1948 compared with a decline of about 1 million in 1949. Furthermore, imports of refined products showed a gain of about 20 million barrels in 1949 compared with 1948.

Other unfinished oils (net)	[4] 5,727	[4] 1,615	[4] 1,227	[4] 513	4,464	[4] 8,068
Shortage	6,954	1,695	4,222	2,768	2,768	585
Total output	1,789,858	1,793,058	1,922,938	2,107,278	2,124,567	2,030,976

[1] Includes California data on a new basis to compare with 1949.
[2] Preliminary figures.
[3] Conversion factors: 280 pounds of wax to the barrel; 5.0 barrels of coke to the short ton; 5.5 barrels of asphalt to the short ton; 3,600 cubic feet of still gas to the barrel.
[4] Negative quantity; represents net excess of unfinished oils rerun over unfinished oils produced.

The small decline in total demand in 1949, compared with 1948 on a daily average basis, included a gain of about 5 percent for motor fuel and declines of almost 1 percent for residual fuel oil, 6 percent for distillate fuel oil, 9 percent for kerosine, and 6 percent for all other products.

Exports of refined products average 237,000 barrels daily in 1949, a decline of about 12 percent compared with 1948. Exports of motor fuel increased about 6 percent, exports of residual fuel oil and miscellaneous products were about the same, exports of distillate fuel oil were reduced about 43 percent, and kerosine exports dropped about 30 percent.

Domestic demand for all products in continental United States averaged 5,792,000 barrels daily in 1949, a small gain of 0.3 percent compared with 1948—including a gain of about 5 percent for motor fuel and declines of about 1 percent for residual fuel oil, 3 percent for distillate fuel oil, 8 percent for kerosine, and 5 percent for other products.

The new supply of refined products is directly related to the volume of refinery output from crude oil, the production of light products from natural gas, and the imports of refined products.

The production of light products at natural-gasoline and cycle plants increased from 146.7 million barrels in 1948 to 156.2 million in 1949. The amount of motor benzol from coke-oven operations that was blended with motor fuel decreased from 0.4 million barrels in 1948 to 0.2 million in 1949. These two items combined represent the volume of liquid fuels from other sources than crude oil and showed a daily average gain of about 6.5 percent in 1949 compared with 1948. The total amount of these fuels marketed in 1949 amounted to 155.1 million barrels, with about 69 percent included in the motor-fuel balance, over 29 percent included with liquefied petroleum gases for fuel and chemical uses, and less than 2 percent transferred to other products.

Imports of refined products into continental United States increased from 59.1 million barrels in 1948 to 79.2 million in 1949, a gain of almost 35 percent on a daily average basis. The principal change was the increase in imports of residual fuel oil from 53.3 million barrels in 1948 to 74.6 million in 1949, a 40-percent gain. Except for a small gain in unfinished oils, the relatively small imports of other products declined.

[1] Preliminary figures.

[2] Figure on new basis due to transfers in California of stock formerly reported as distillate and residual fuel oils to "other unfinished oils", and excludes the following quantities from distributors' stocks: Kerosine, 115; distillate fuel oil, 1,469; residual fuel oil, 529. Figures for 1948 on the old basis and comparable with preceding years are as follows: Kerosine, 24,056; distillate fuel oil, 76,001; residual fuel oil, 76,970; other unfinished oils, 46,362.

[3] Beginning with January 1948, exports of grease were transferred from "other finished products" to "lubricants."

[4] Figure on new basis that excludes distributors' stocks in California and is comparable with subsequent years. Figures for 1947 on the old basis and comparable with preceding years are as follows: Lubricants, 8,624; asphalt 4,021; other finished products 1,107.

[5] Liquefied refinery gases.

[6] Liquefied petroleum gases.

[7] Negative quantity; represents net excess of unfinished oils produced over unfinished oils rerun.

[1] Yields computed on the new basis for California to compare with 1949.
[2] Preliminary figures.
[3] Not separated after 1946.
[4] Less than 0.1 percent.
[5] Negative percentage; represents excess rerun over produced.
[6] Added to finished gasoline production in computing yields after 1946.
[7] Added to crude in computing yields after 1946.

The comparison of refinery operations in 1949 with 1948 is complicated by changes in the method of reporting operations in the California district in the latter year. The major changes involved in 1949 were the reporting of most of the crude oil formerly classed as transfers to residual fuel oil as crude run to stills; compensating adjustments in the refinery output of residual fuel oil, distillate fuel oil, and other unfinished oils; and shifts in the relative stocks of residual fuel and distillate fuel oil, to other unfinished oils. These adjustments were in the supply side and did not change the demand for the major products involved. To obtain correct comparisons for crude runs, refinery production, and yields as reported in 1949, revisions must be made on the same basis for the corresponding items in 1948, while the old 1948 figures are comparable with 1947 and previous years.

The crude runs to stills in 1949 amounted to 1,945.5 million barrels or 5,330,000 barrels daily. The comparable figure for 1948, on the new basis, was 2,048.4 million barrels or 5,597,000 barrels daily—a decline of 4.8 percent in daily average runs.

The yields of the principal refined products from crude oil in 1949 were 43.7 percent for gasoline, 21.7 percent for residual fuel oil, 17.4 percent for distillate fuel oil, and 5.2 percent for kerosine. Comparable yields for 1948, on the new basis, were 40.1 percent for gasoline, 23.5 percent for residual, 18.5 percent for distillate, and 6.0 percent for kerosine.

Total stocks of refined products amounted to 343.5 million barrels on January 1, 1949, and 342.7 million on December 31, 1949—a decrease of 0.8 million during the year, including a decline of 14.3 million in districts east of California and a gain of 13.5 million in the California district.

Stocks of finished gasoline increased 8.1 million barrels in 1949, including gains of 6.1 million in California and 2.0 million east of California. Total stocks of residual fuel oil decreased 3.8 million barrels in 1949, with a gain of 9.3 million in California and a decline of 13.1 million east of California. Total stocks of distillate fuel oil increased 3.8 million barrels in 1949, including gains of 3.7 million in California and 0.1 million in other districts. Stocks of kerosine declined 3.1 million barrels, with an increase of 0.1 million in California and a decline of 3.2 million elsewhere. Stocks of all other products were reduced 5.4 million barrels, including declines of 5.2 million in California and 0.2 million in other districts. These figures indicate a substantial adjustment to excess inventories in districts east of California that was largely offset by surplus production in California.

The small reduction in the value of crude oil at the well in 1949 was not a major factor affecting the price of products. The considerable changes in the prices of the different products were due, in greater part, to surplus seasonal stocks and variations in the demand for the different products.

The average price of Regular Grade gasoline at Oklahoma refineries rose from 8.42 cents per gallon in 1947 to 11.19 cents in 1948 and declined to 10.15 cents per gallon in 1949. The average tank-wagon price of kerosine at Chicago rose from 13.40 cents per gallon in 1947 to 15.85 cents in 1948 and declined to 15.33 cents in 1949. The average price of a selected bright stock at Oklahoma refineries rose from 28.84 cents per gallon in 1947 to 31.67 cents in 1948 and declined to 19.43 cents in 1949. The price of Bunker "C" oil at New York rose from $2.29 per barrel in 1947 to $3 in 1948 and declined to $1.90 in 1949. The price of No. 2 distillate heating oil at New York rose from 7.02 cents per gallon in 1947 to 9.71 cents in 1948 and declined to 8.17 cents in 1949.

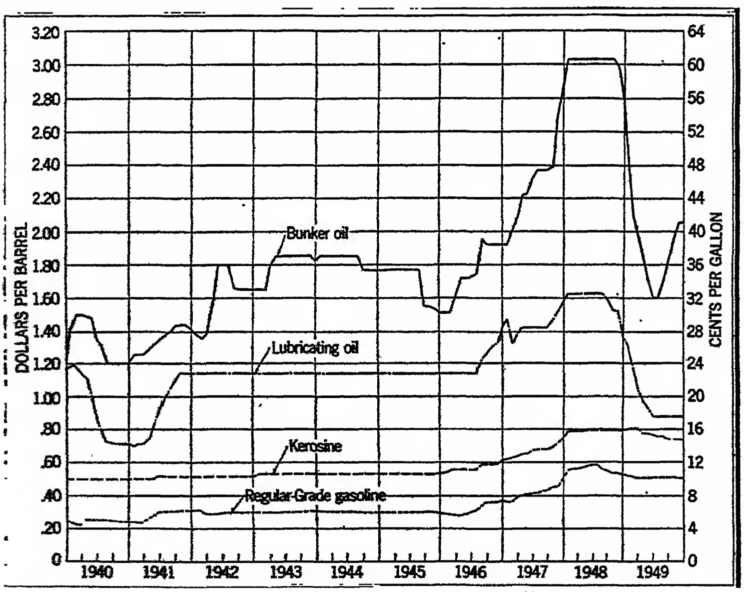

FIGURE 7.—Prices of Bunker "C" oil at New York Harbor, bright stock at Oklahoma refineries, tank-wagon prices of kerosine at Chicago, and Regular Grade gasoline at refineries in Oklahoma, 1940–49, by months.

[1] Conversion factors: 280 pounds of wax to the barrel; 5.0 barrels of coke to the short ton; 5.5 barrels of asphalt to the short ton; 3,600 cubic feet of still gas to the barrel.
[2] Negative quantity; represents net excess of unfinished oils rerun over unfinished oils produced.
[3] Negative quantity (overage).
[4] Preliminary figures.

REFINERY CAPACITY

The total reported daily crude-oil capacity of refineries in the United States increased from 6,438,995 barrels on January 1, 1949, to 6,696,300 at the end of the year—a gain of 257,305 barrels daily during the year. The total capacity in operation declined from 6,230,505 barrels daily on January 1, 1949, to 6,222,998 at the end of the year, while the capacity of all shut-down units increased from 208,490 barrels daily on January 1, 1949, to 473,302 at the end of the year. The total capacity being built, including replacements as well as new capacity, declined from 341,500 barrels daily on January 1, 1949, to 145,600 on January 1, 1950.

The total daily crude capacity of refineries increased about 1,127,000 barrels in the 3 years from January 1, 1947, to January 1, 1950—an increase of about 20 percent. The principal changes in refinery capacity by districts during this period were gains of 328,000 barrels daily in the Texas Gulf coast district, 240,000 in the Indiana-Illinois district, 181,000 in the east coast district, 139,000 in the California district, 112,000 in the Louisiana Gulf coast district, 90,000 in the Oklahoma-Kansas district, 83,000 in the Rocky Mountain district, and 3,000 in the Appalachian district. There were declines of 25,000 barrels daily in the Arkansas and Louisiana inland district, and 24,000 in the Texas inland district.

Assuming that refineries could run annually at about 95 percent of capacity, allowing for necessary shut-downs and repairs, the potential crude runs to stills on January 1, 1950, were 6,361,000 barrels daily, compared with actual crude runs of 5,330,000 barrels daily in 1949, and the all-time peak runs of 5,597,000 barrels daily in 1948, computed on the same basis in California to compare with 1949.

TABLE 53.—Petroleum-refinery capacity in the United States, Jan. 1, 1945–50

Year	Number of refineries				Capacity (barrels per day)			
	Operating	Shut down	Total	Building	Operating	Shut down	Total	Building
1945	380	33	413	1	5,077,690	223,463	5,301,153	36,075
1946	364	29	393	1	5,086,165	229,691	5,315,856	53,100
1947	361	38	399		5,336,399	233,083	5,569,482	162,200
1948	352	38	390	2	5,825,566	208,686	6,034,252	367,250
1949	336	39	375	3	6,230,505	208,490	6,438,995	341,500
1950	320	47	367	2	6,222,998	473,302	6,696,300	145,600

AVIATION GASOLINE

The total demand for aviation gasoline rose from 15.2 million barrels in 1946 to 26.7 million in 1947, 43.0 million in 1948, and 42.8 million in 1949. The lower indicated demand in 1946 and 1947 was due, in considerable part, to liquidation of large stocks held in military custody. Exports of aviation gasoline have steadily increased from 2.3 million barrels in 1946 to 5.1 million in 1947, to 6.2 million in 1948, and to 8.8 million in 1949. Domestic demand for aviation gasoline in continental United States amounted to 12.9 million barrels in 1946, rose to 21.6 million in 1947 and to 36.7 million in 1948, declining to 34.0 million in 1949. This domestic demand included reported deliveries to all military agencies of 1.0 million barrels in 1946, 7.1 million in 1947, 17.6 million in 1948, and 16.8 million in 1949.

The total demand for aviation grades of 100-octane and above has increased rapidly, while the demand for lower finished grades and components has declined. The total demand for 100-octane and above rose from 16.5 million barrels in 1947 to 33.2 million in 1948 and 33.8 million in 1949. The demand for lower grades and components declined from 10.2 million barrels in 1947 to 9.7 million in 1948 and 8.9 million in 1949.

The total production of aviation gasoline by districts indicates that the output of district 3 represented 59.1 percent of the total in 1948 and 59.3 percent in 1949, while the output of district 5 amounted to 26.9 percent of the total in 1948 and 25.3 percent in 1949. The production of district 2 rose from 6.7 percent of the total in 1948 to 9.7 percent in 1949.

Aviation gasoline is discussed separately because of the special interest in this type of fuel. All aviation-gasoline figures are included in the total figures for motor fuel and gasoline in this report. The figures for aviation gasoline represent the amounts so identified and reported by producing companies but do not include the consumption of regular automotive types of gasoline that may be used by many small planes. It should be noted that, in the production figures for aviation gasoline, the item "transfers out" represents rejected material returned to regular grades of gasoline and that this item is subtracted from the gross production figure to determine the net production of marketable grades.

MOTOR FUEL

Motor fuel was the only major product to show a substantial gain in demand in 1949. The total demand for motor fuel set another new record of 952.4 million barrels in 1949—an increase of 43.9 million or 5.1 percent on a daily average basis. Exports increased from 37.3 million barrels in 1948 to 39.5 million in 1949, while domestic demand in continental United States rose from 871.3 million barrels in 1948 to 912.9 million in 1949—a gain of 41.6 million or 5.1 percent on a daily average basis. Since the domestic demand for aviation grades declined from 36.7 million barrels in 1948 to 34.0 million in 1949, the gains were all in automotive and other uses.

[1] Preliminary figures.
[2] Includes LP-gases sold for fuel and chemical uses.

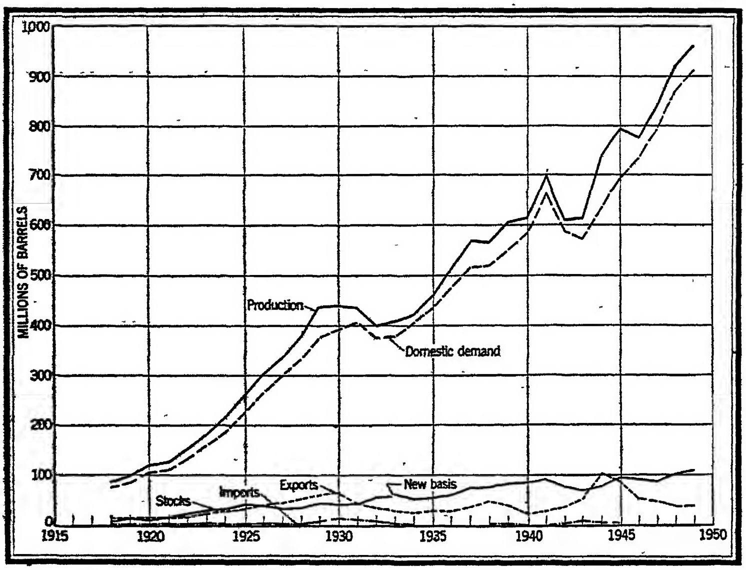

FIGURE 8.—Trends of production, domestic demand, exports, imports, and stocks of motor fuel in the United States, 1918–49.

Production.—The total production of motor fuel rose from 921.9 million barrels in 1948 to 961.8 million in 1949. Production in 1949 included an output of 853.6 million barrels of gasoline and naphtha from crude oil at refineries at a yield of 43.7 percent and an output of motor fuel from other light oils amounting to 108.2 million barrels. The latter figure was obtained by adding the total production of light oils from natural gas to the small amount of motor benzol derived from coke ovens and subtracting the amount of these oils transferred to liquefied gases under miscellaneous products and a relatively small amount of other products transferred to unfinished oils. The total production of these light oils amounted to 156.4 million barrels in 1949 and transfer to products other than motor fuel totaled 48.2 million barrels, leaving the net production included in motor fuel of 108.2 million barrels.

Refinery output of gasoline and naphtha in 1949 totaled 939.1 million barrels, including the output of 853.6 million barrels from crude oil and 85.5 million barrels of the other light oils shipped to refineries for blending.

The remainder of the light oils included in motor-fuel production (22.7 million barrels) was used as motor fuel or blended with gasoline outside refineries, exported, added to storage, or represented losses or shrinkage in processing.

Yields.—The average refinery yield of gasoline and naphtha from crude oil was 43.7 percent in 1949 compared with a yield of 40.1 percent in 1948, computed on the new basis for reporting refinery operations in California. The increase in yield in 1949 reflected the substantial gain in gasoline demand compared to reduced demand and lower production of fuel oils due to surplus inventories.

[1] Preliminary figures.

[2] Based on crude runs to stills adjusted for net unfinished.

Exports.—Exports of motor fuel from continental United States, including shipments to noncontiguous Territories, amounted to 47.5 million barrels in 1947, declined to 37.3 million in 1948, and rose to 39.5 million barrels in 1949. The total in 1948 included 32.6 million barrels exported to foreign countries and 4.7 million shipped to noncontiguous Territories. In 1949 exports to foreign countries amounted to 33.9 million barrels, and shipments to Territories amounted to 5.6 million. The increase of 2.2 million barrels in exports and shipments in 1949 included a gain of 1.3 million to foreign countries and 0.9 million to noncontiguous Territories. Compared with 1948, the largest gains were 1.4 million barrels to North American countries, 0.3 million to Africa, and 0.2 million to Oceania. The principal decline in exports was 0.7 million barrels to Asia. In spite of the increase in 1949, future exports to foreign countries are expected to continue to decline because of the dollar-exchange situation and the increased competition from expanding refinery capacity abroad.

Domestic Demand.—The domestic demand for motor fuel set another new record in 1949, increasing from 871.3 million barrels in 1948 to 912.9 million in 1949. The average domestic demand for motor fuel rose from 2,380,000 barrels daily in 1948 to 2,501,000 barrels daily in 1949, a gain of 5 percent. Domestic demand in the first quarter of 1949 averaged 2,157,000 barrels daily, an increase of 5.5 percent compared with the first quarter of 1948. In the second quarter of 1949, domestic demand averaged 2,640,000 barrels daily or 5.6 percent higher than in the same period of 1948. In the third quarter of 1949, domestic demand averaged 2,690,000 barrels daily or 4.0 percent greater than in 1948. In the fourth quarter of 1949, domestic demand for motor fuel averaged 2,511,000 barrels daily or 5.1 percent above the fourth quarter of 1948. The percentage of total domestic demand, by quarters, in 1949 was 21.3 percent in the first quarter, 26.3 percent in the second quarter, 27.1 percent in the third quarter, and 25.3 percent in the fourth quarter.

The annual survey of the Public Roads Administration includes an analysis of civilian motor-fuel consumption based on tax returns of the various States. The total shown in these surveys is considerably smaller than the domestic demand shown by the Bureau of Mines. The difference represents deliveries to the armed forces, any losses in production or transportation before the point of tax incidence, and probably some commercial and industrial uses of gasoline and naphtha that are not recorded in the exemptions from State taxes. In 1948 this survey covered a total motor-fuel usage of 826.4 million barrels or 44.9 million barrels less than the Bureau of Mines domestic demand of 871.3 million barrels. The total usage for 1948 included 725.3 million barrels for highway use, 92.1 million for nonhighway uses, and 9.0 million for losses. The increase in highway use was 7.7 percent

compared with 1947 on a daily average basis. In 1949 the total usage shown was 877.0 million barrels or 35.9 million less than the Bureau of Mines domestic demand of 912.9 million barrels. The total usage for 1949 included 772.2 million barrels for highway use, 95.4 million for nonhighway uses, and 9.4 million for losses. The increase in highway use was 6.8 percent compared with 1948 on a daily average basis.

Production and Consumption by States.—The accompanying table showing the production and consumption of gasoline by States, is designed to indicate roughly the areas of surplus production and deficit supply. The refinery production used is compiled from reports to the Bureau of Mines and does not include the natural gasoline blended or used outside refineries. The consumption figures used are compiled from State tax reports by the American Petroleum Institute. These figures are closer to the domestic demand figure of the Bureau of Mines than those of the Public Roads Administration, as they include deliveries to the armed forces for use in continental United States but exclude shipments to the armed forces abroad.

In 1949 the refinery production figure amounted to 939.1 million barrels and the consumption figure to 893.9 million barrels. The production figure includes a large part of the gasoline for export and also considerable additions to storage in 1949. The consumption figure of 893.9 million barrels in 1949 was 19.0 million less than the domestic demand figure of 912.9 million barrels shown by the Bureau of Mines.

Comparison of production and consumption by broad districts will indicate the major distribution between surplus and deficit areas. The Gulf Coast States (including Texas, Louisiana, Mississippi, and Alabama) showed a refinery production of 361.4 million barrels of gasoline in 1949 compared with a consumption of 99.0 million—a surplus of 262.4 million. Known movements out of this district include shipments to the Atlantic States of 155.6 million by boat and 15.7 million barrels by pipeline and pipeline shipments of 23.1 million barrels to States to the north. The balance of the surplus includes a major part of total exports and other shipments north by tank car or barge.

The Atlantic Coast States produced 128.6 million barrels of gasoline in 1949 and consumed 284.5 million—a deficit of 155.9 million. Receipts from the Gulf coast of 155.6 by boat and 15.7 by pipeline indicate a surplus that took care of a pipeline movement of 5.5 million barrels to the West and provided for some exports, overseas military shipments, and some rail or barge shipments to the West.

The Pacific coast district (California, Oregon, Washington, Nevada, and Arizona) produced 135.6 million barrels of gasoline in 1949 and consumed 122.6 million. With 6.1 million barrels added to stocks in 1949, the remainder of the surplus represented exports or deliveries outside the district.

TABLE 59.—Production and consumption of gasoline in the United States, 1947–49, by States

[1] Preliminary figures.
[2] American Petroleum Institute.
[3] Alabama and Mississippi included with Louisiana.
[4] Washington included with California.
[5] Maryland and South Carolina included with Georgia.
[6] Idaho included with Wyoming.
[7] Minnesota and Wisconsin included with Illinois.
[8] Missouri and Nebraska included with Kansas.
[9] Tennessee included with Kentucky.
[10] Rhode Island included with Massachusetts.

The Mountain States (Montana, Idaho, Wyoming, Colorado, Utah, and New Mexico) produced 29.8 million barrels in 1949 and consumed 31.8 million, indicating a small deficit supplied from the Pacific Coast district or States to the east.

The remaining Central States produced 283.8 million barrels of gasoline in 1949 and consumed 356.0 million—a deficit of 72.2 million. Receipts by pipeline, tank car, and barge from adjacent districts supply this deficit, with the Gulf Coast district the largest contributor. The States in this district east of the Mississippi River produced 192.1 million barrels of gasoline in 1949 and consumed 225.5 million—a deficit of 33.4 million. The States in this district west of the Mississippi produced 91.7 million barrels and consumed 130.5 million—a deficit of 38.8 million.

While by no means complete, the review gives a fair idea of the general domestic distribution of motor fuel and the trends of consumption in different areas.

Methods of Distribution.—The expansion of product pipelines has resulted from the effort to secure a cheaper long-distance movement of products to inland markets. Refineries originally established near oil fields to supply local markets for heavy fuel oils have been forced to seek wider markets for light products. Heavy fuel oil can only be moved by boat or tank car and cannot be profitably moved long distances toward centers of local coal production. The recent decline in the consumption of residual fuel oil by railroads has made this problem more acute. Gasoline is still the major product moved in these lines but increasing amounts of light distillate fuel oils and kerosine are being carried.

In 1948, the product lines delivered 243.2 million barrels of gasoline, 47.8 million barrels of distillate fuel, and 17.7 million barrels of kerosine. Deliveries in 1949 included 278.0 million barrels of gasoline, 49.1 million of distillate, and 17.7 million of kerosine. The increase in gasoline movement was in line with the substantial increase in demand, while the minor changes for the light fuels reflected reduced demand and surplus stocks near the point of consumption.

The major boat movement of products is from the Gulf coast to east coast ports. In 1949 this movement handled 371.8 million barrels of oil products compared with 371.3 million in 1948. Gasoline shipments increased from 145.8 million barrels to 155.6 million; kerosine declined from 40.0 million to 35.0 million; distillate fuel oil declined from 104.6 million to 102.2 million; residual fuel oil fell from 68.7 million to 67.4 million; and lubricants and miscellaneous products decreased from 12.2 million barrels to 11.6 million. The failure of this movement to show a substantial gain reflects reduced fuel-oil demand, large product stocks in the east coast district, and increased imports of residual fuel oil.

[1] The quantities "Turned into lines" and "Delivered from lines" are on a net basis, eliminating intersystem transfers, and are not comparable with data published for previous years.

Stocks.—Stocks of gasoline, as reported, include stocks held at refineries and bulk terminals and by pipelines but do not include stocks in secondary distribution tanks, in consumers' hands, or in military custody.

Stocks of finished gasoline increased 8.1 million barrels in 1949—from 95.5 million on the first of the year to 103.6 million on December 31, 1949. Stocks of natural gasoline and cycle products increased 1.3 million barrels in 1949—from 5.6 million barrels to 6.8 million on December 31, 1949. Stocks of unfinished gasoline declined from 8.3 million barrels on January 1 to 7.9 million on December 31, 1949—a decrease of 0.4 million.

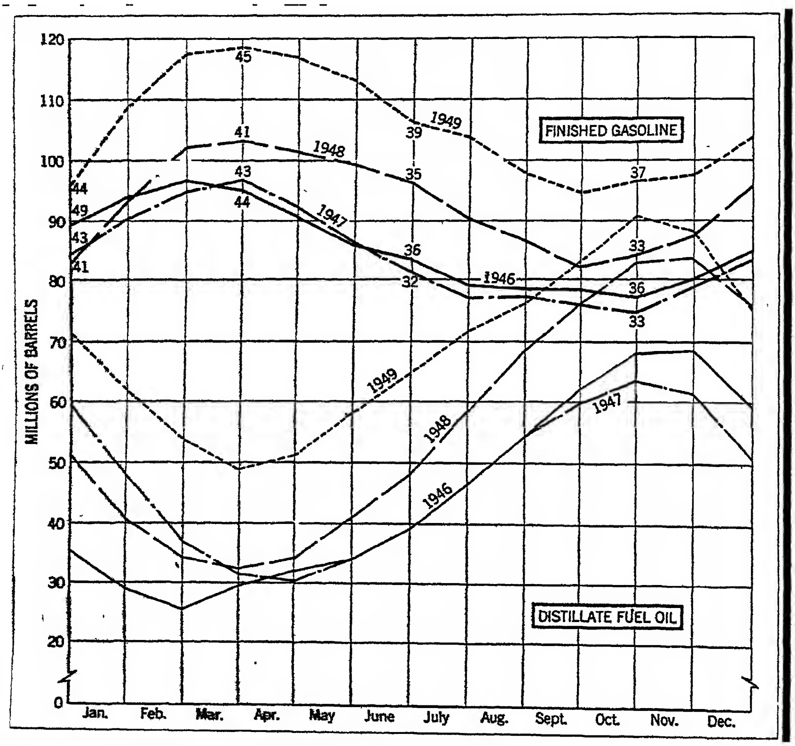

FIGURE 9.—Stocks of finished gasoline in the United States, 1946–49, by months, with figures representing days' supply at certain periods, also stocks of distillate fuel oil, 1946–49, by months.

1 Includes stocks of finished gasoline at refineries and bulk terminals, and in pipelines.

The change of finished gasoline stocks by quarters in 1949 indicates a somewhat more than normal gain, or 23.3 million barrels in the first quarter, a decline of 12.8 million in the second quarter, a decrease of 11.6 million in the third quarter, and a substantial gain of 9.1 million barrels in the last quarter.

Stocks of finished and unfinished gasoline increased from 103.8 million barrels on the first of the year to 111.5 million on December 31, 1949—an increase of 7.7 million barrels. The principal changes, by refinery districts, were gains of 5.6 million barrels in the California district, 0.7 million in the mountain district, 0.5 million in the Indiana-Illinois and Texas Gulf districts, and 0.4 million in the Appalachian district. The only declines were 0.3 million barrels in the east coast district and 0.2 million in the Texas inland district.

Stocks may be expressed in terms of days supply by dividing the stocks at the end of a month by the daily average total demand for the succeeding month. Using this basis, the stocks of finished gasoline represented 46.9 days supply in December 1949 compared with 44.1 days supply for December 1948.

TABLE 63.—Days' supply of motor fuel on hand in the United States at end of month, 1947–49 [1]

[1] Stocks divided by the daily average total demand (domestic demand plus exports) for succeeding month.
[2] Preliminary figures.

Prices.—In general, there was a moderate gain in gasoline prices during 1949 compared with substantial declines for other major products. The lighter types of crude most suitable for gasoline production showed few changes in value at the well in 1949, the declines being in crudes high in lubricants or in the heavy types of crude oil.

The average dealer's net price for Regular Grade gasoline (exclusive of tax) in 50 representative cities in the United States supplies an index of gasoline prices at the wholesale level. This average price, according to the American Petroleum Institute, rose from 12.33 cents per gallon in 1947 to 14.55 cents in 1948 and to 15.05 cents in 1949. Starting at 14.66 cents in December 1948, it rose to 14.87 cents in January 1949, 14.92 cents in February, and 15.19 cents in May, and declined to 15.15 cents in September, 15.12 cents in October, and 14.85 cents per gallon in December. In this same series, the average service-station price, including State and local taxes but not the Federal tax,

rose from 24.38 cents per gallon in 1948 to 25.29 cents in 1949. Including the Federal tax of 1.50 cents per gallon, the total average price to the consumer for Regular Grade gasoline rose from 25.88 cents per gallon in 1948 to 26.79 cents in 1949. There was no change in the Federal tax, but the average State taxes rose from 4.61 cents per gallon in 1947 to 4.75 cents in 1948 and 4.92 cents in 1949. The average local taxes rose from 0.07 cent per gallon in 1947 to 0.09 cent in 1948 and 0.10 cent in 1949.

KEROSINE

The production of kerosine dropped noticeably in 1949; as a result, it was necessary to withdraw an additional quantity from storage to satisfy domestic and export demands. This situation was quite different from conditions prevailing in 1948, when production was not only adequate to satisfy a greatly increased demand but there was also a large surplus diverted to storage. No kerosine was imported in 1949, and only a small amount was received in 1948.

Kerosine production declined from a unusually large total of 121,914,000 barrels in 1948 to 102,152,000 in 1949, a shrinkage of 16 percent. This smaller output in 1949 was due to both a 4-percent drop in crude runs to refineries in 1949 and to a lower yield—5.2 percent compared with 6 percent in 1948.

All refinery districts produced smaller quantities of kerosine in 1949 than in 1948, except the Rocky Mountain and California areas. The greatest relative decline in kerosine production was reported for the East Coast refinery district, where the total of 10,446,000 barrels was 39 percent below the 1948 quantity of 17,004,000 barrels. The 1949 output for the district represented only 10 percent of the na-

tional total compared with a 14-percent proportion in 1948. About 30 percent of the kerosine comes from refineries operating in the Texas Gulf Coast district, and the quantity credited to the area was lower by 18 percent from 37,910,000 barrels in 1948 to 31,026,000 in 1949. The relative decline in kerosine production for the Indiana-Illinois-Kentucky district, where about one-fifth of the total originates, was not so pronounced—only 9 percent—or from a total of 21,780,000 barrels in 1948 to 19,836,000 in 1949. There was also a fairly moderate reduction in the quantity of kerosine produced (down 6 percent) in the Louisiana Gulf Coast district, where the quantities were 18,409,000 barrels in 1948—15 percent of the national total—and 17,380,000 in 1949—17 percent of the output. Refineries in the Oklahoma-Kansas-Missouri group of States turn out about 7 percent of the kerosine, and there the total dropped 19 percent—from 8,916,000 barrels in 1948 to 7,217,000 in 1949.

Relatively less important quantities of kerosine are produced in the remaining refinery districts. The respective totals were lower in 1949 for the Appalachian (down 19 percent), Texas Inland (down 14 percent), and Arkansas-Louisiana Inland-Mississippi areas (down 15 percent) but greater for the Rocky Mountain States, where there was a 9-percent gain in 1949 over 1948, and the California refinery district, where 3 percent more kerosine was produced in 1949.

TABLE 65.—Salient statistics of kerosine in the United States, 1948–49, by months and districts

Month and district	Production (thousand barrels)		Yield (percent)		Domestic demand (thousand barrels)		Stocks, end of period (thousand barrels)

[1] Preliminary figures.
[2] Stocks, 23,941 barrels on new basis to compare with 1949.
[3] Figures not available.

A 9-percent decline in the domestic demand for kerosine in 1949 is in contrast to a 10-percent gain in 1948 over 1947. Domestic requirements in 1949—102,673,000 barrels—were well below the 1948 total of 112,220,000, largely because of milder weather in 1949; furthermore, it is believed that during the unusually cold month of January 1948, when there were spot shortages of light grades of fuel oil, large quantities of kerosine were used for fuel in central heating plants, explaining the greatly expanded demand for that year. The domestic demand for kerosine was down sharply in the first half of 1949—16 percent below in the first quarter compared with the same 3 months of 1948 and 24 percent down in the second quarter. Indicated requirements in the third quarter of 1949 were little below (2 percent) the comparative total for 1948, and there was a 6-percent gain in the final 3 months of the year over the same period of 1948. This rate of increase was accelerated in the opening quarter of 1950, when the domestic demand was 14 percent over the initial 3 months of 1949 and the total (38,258,000 barrels) about equaled the unusually high level reached in the first 3 months of 1948.

With rising difficulties in "dollar" exchange and with more kerosine becoming available from rebuilt and new refineries in foreign countries, American exports have declined sharply from a "peak" of 8,637,000 barrels in 1946 to 3,495,000 in 1948 and 2,532,000 in 1949. The downward trend continued into 1950, as the total for the first quarter is only 583,000 barrels compared with 972,000 in the same period of 1949.

Year-end stocks of kerosine, which reached an unusually high level of 23,941,000 barrels in 1948, declined to 20,888,000 in 1949, a shrinkage of 13 percent. Supplies held at refineries were lower by 15 percent—from 14,110,000 barrels in 1948 to 12,030,000 at the close of 1949—while those at bulk terminals and in pipelines were down by 10 percent—9,831,000 barrels in December 1948 and 8,858,000 a year later. The refinery stocks declined from 59 percent of the total in 1948 to about 58 percent at the end of 1949, and the percentage share held at other points gained correspondingly. Kerosine in storage at the end of 1949 represented a 47-day supply at the January 1950 average daily rate of demand, which compares with a 57-day reserve available 12 months previous.

Stocks of kerosine held in the several refinery districts were lower at the end of 1949 than in 1948, except in the California and Rocky Mountain areas, where quantities stored are relatively of minor importance. About 45 percent of the kerosine inventory is credited to the East Coast area, where the total dropped by 10 percent. About a fifth of the stocks are reported from the Indiana-Illinois-Kentucky refinery district; however, in this group of States the decline in 1949 was well below the average—less than 5 percent for the year. The 1949 year-end total for the Texas Gulf Coast area varied only slightly from the December 1948 quantity, which was in contrast to a 50-percent decline reported for the Louisiana Gulf Coast district. Kerosine stocks carried in other refinery areas are relatively small, and all declined sharply in 1949.

Sales of kerosine continued to mount in 1948 as in recent years, and the total of 112,487,000 barrels reported for the year was about 10 percent over the 1947 quantity of 102,703,000, as reported in the annual survey made by the Bureau of Mines. This gain compares with a 17-percent increase in 1947 over 1946; however, it is believed that the 1948 total was inflated by the use of kerosine in place of No. 1 fuel oil in central heating plants during spot shortages in early 1948 in some areas. This seems to be substantiated by the fact that the indicated demand for kerosine in the first two quarters of 1949 was 24 percent below the comparative total for 1948. Kerosine sold for range oil increased from 62,482,000 barrels in 1947 to 70,629,000 in 1948—a gain of 13 percent compared with an expansion of 20 percent in 1947 over 1946 deliveries. Kerosine reported as delivered for tractor fuel declined sharply from 8,209,000 barrels in 1947 to 6,176,000 in 1948, a drop of 25 percent, due largely to a shift to gasoline for fuel, while all other uses (lamp fuel, insecticides, oil-company uses, etc.) totaled 33,791,000 barrels in 1948, a 6-percent gain over the 1947 demand of 32,012,000 barrels. Distributors reported the delivery of kerosine for jet-propulsion fuel for the first time in 1948—a total of 1,891,000 barrels.

The proportion of kerosine sold to satisfy the range-oil demand continued to rise, rising from 56 percent of the total of all deliveries in 1943 to 61 percent in 1947 and 63 percent in 1948. Kerosine used as tractor fuel accounted for about 6 percent of the market in 1948 compared with an average of 8 percent in recent years. Jet-propulsion fuel reported separately for the first time in 1948 made up less than 2 percent of the kerosine sales, while all other uses declined from 31 percent of all demands in 1947 to 30 percent in 1948.

Over a quarter of the kerosine is sold in the New England States, where it is extensively used for range-burner fuel. Deliveries in that area were 26,293,000 barrels in 1947 and 27,998,000 in 1948—a gain of 7 percent. The Middle Atlantic and North Central States are also important markets for kerosine, and requirements were up by 12 and 8 percent, respectively, in these areas in 1948 compared with 1947. Fairly large quantities of kerosine are also consumed in the South, and deliveries in 1948 were higher by 5 percent in the South Central region and 15 percent in the South Atlantic States. Relatively small amounts of kerosine are distributed in the West Coast and Rocky Mountain areas; however, sales showed substantial gains in 1948.

Most of the kerosine used for tractor fuel is reported from the Middle West. The demand in the North Central States declined from 4,040,000 barrels in 1947 to 3,017,000 in 1948, while quantities for the South Central area were 2,657,000 barrels in 1947 and 1,688,000 in 1948.

[1] Figures for 1949 by States not available when table was compiled.

The survey covering sales of kerosine in 1949 was incomplete when this review was written; however, it is estimated that out of the total indicated demand of 102,673,000 barrels for the year as taken from the Bureau of Mines Monthly Petroleum Statement for December 1949, about 65,700,000 barrels were sold for range oil, 4,800,000 for tractor fuel and the balance—32,173,000 barrels—was delivered for various other uses. It is also believed that an additional 12,300,000 barrels of No. 1 fuel oil were also sold for range burner fuel, making a total range-oil demand of 78,000,000 barrels in 1949.

The upward trend in representative kerosine prices during recent years was interrupted in 1949, when there was a nominal decline. The average price of 9.47 cents a gallon for 41°–43° gravity, water-white kerosine, at refineries in Oklahoma in December 1948 declined gradually to an average of 8.15 cents a gallon in September 1949. With the increased demand in the final quarter of 1949, the quotation was raised slightly to an average of 8.31 cents in December and an average of 8.58 cents for the year compared with the 1948 average price of 9.58 cents a gallon. Kerosine, including No. 1 fuel oil at New York Harbor dropped from an average of 10.57 cents a gallon for December 1948 to a low of 8.45 cents in the June-August period of 1949. It fluctuated up and down in the remaining months of the year to an average of 8.90 cents a gallon in December and an average of 9.12 cents a gallon for the year compared with 10.96 cents for all of 1948.

Kerosine, tank-wagon at New York City do	14.08	14.20	14.20	14.20	14.20	14.20	14.35	14.50	14.50	14.50	14.50	14.31	14.31
1949													
41°-43° gravity w. w. kerosine at refineries, Oklahoma do	9.33	9.24	8.98	8.72	8.69	8.52	8.35	8.16	8.15	8.25	8.25	8.31	8.58
Kerosine (and/or No. 1 fuel oil) at New York Harbor do	10.30	10.30	9.93	9.12	8.61	8.45	8.45	8.45	8.88	9.20	8.83	8.90	9.12
Kerosine, tank-wagon at Chicago do	16.02	16.10	16.07	15.66	15.60	15.43	15.10	15.10	14.85	14.70	14.70	14.71	15.33
Kerosine, tank-wagon at New York City do	14.30	13.99	13.46	12.97	12.45	12.30	12.30	12.30	12.45	12.81	12.90	12.90	12.93

The tank-wagon price of kerosine at Chicago, which averaged 15.90 cents a gallon in December 1948, rose to a 16.10-cent level in February 1949 and gradually declined to a 14.70-cent average in October and November. An increase to 15 cents a gallon on the closing day of the year pulled up the average to 14.71 cents for December and to an average of 15.33 cents for all of 1949 compared with 15.85 cents a gallon in 1948. Kerosine sold from tank wagons in New York City declined gradually from a December 1948 average of 14.31 cents a gallon to 12.30 cents in the June-August period. The quotation then rose to a 12.90-cent average in November and December and a yearly average of 12.93 cents for all of 1949 compared with 14.31 cents in 1948.

Rail and truck shipments of kerosine from the California marketing area to other parts of the country totaled 19,000 barrels in 1949 compared with 25,000 in 1948. No tanker shipments of kerosine from the west coast to the east coast have been made in recent years. The Pacific Coast area received 4,000 barrels of kerosine by overland routes in 1948 and none in 1949.

Published reports released by the Oil and Gas Division, United States Department of the Interior, show that barge shipments of kerosine to terminals on the Mississippi River and its tributaries totaled 5,783,000 barrels in 1949 compared with 5,342,000 in 1948. Texas was credited with 912,000 barrels of the total in 1949 and 507,000 in 1948; Louisiana 3,634,000 barrels in 1949 and 3,678,000 in 1948; and Arkansas and Mississippi 1,237,000 barrels in 1949 compared with 1,157,000 in 1948. Most of these river shipments are terminated in district 2 (5,270,000 barrels in 1949 and 4,826,000 in 1948); however, relatively smaller quantities are also credited to district 3—513,000 barrels in 1949 and 516,000 in 1948. No kerosine reached district 1 over this inland water route in 1948 or 1949.

Tankers and barges moved 35,045,000 barrels of kerosine from the Gulf to the east coast in 1949 compared with a total of 40,020,000 in 1948. Suppliers in Texas were credited with 24,862,000 barrels of the total in 1949 and 31,024,000 in 1948, while the balance, 10,183,000 barrels in 1949 and 8,996,000 in 1948, originated in Louisiana.

There were numerous changes in the Gulf coast—east coast tanker rates for kerosine and other petroleum products in both 1948 and 1949. The rate for kerosine in this movement charged by vessels of over 14,000 tons deadweight, which was $2.565 a long ton or 32.3 cents a barrel on December 31, 1948, was raised to 36.1 cents on January 5, 1949. Frequent changes thereafter brought the rate down to 15.1 cents a barrel on August 10. There was an upward trend in the freight rate after that date until the charge reached 36.1 cents—the same as the early January rate—on December 21, 1949. The average tanker rate for kerosine carried on this run was 25.6 cents a barrel for all of 1949 compared with 47.9 cents in 1948.

DISTILLATE FUEL OIL

Although the total supply of distillate fuel oil, including Diesel fuel, from production, imports, and transfers from crude petroleum in 1949 was about 11 percent below the quantity available in 1948, it was sufficient to satisfy a slightly lower domestic demand and greatly re-

[4] Figures not available.

duced exports plus a small amount to add to stocks. In comparison, an unusually high production of light fuel oils in 1948 enabled suppliers to meet a greatly expanded domestic demand and large exports and in addition there was a surplus of about 25 million barrels to add to storage. The indicated domestic demand for distillate-grade fuel oils in 1949—327,984,000 barrels—was down slightly (about 4 percent) from the 1948 requirements—340,576,000 barrels—while exports were lower by nearly a half—12,189,000 barrels in 1949 compared with 21,293,000 in 1948.

Gains in the domestic demand for distillate fuel oils in the final quarters of 1949 over 1948 requirements were not sufficient to compensate for losses in the first two quarters; consequently, the yearly total was lower by a net 4 percent. The domestic demand in the first quarter of 1949 (108,958,000 barrels) was 5 percent below the unusually high level —114,776,000 barrels—reached in the corresponding period of 1948, and the total for the April–June quarter of 1949—56,228,000 barrels—was much lower (19 percent) than the comparative total—69,311,000 barrels—reported in 1948. This downward trend in domestic demand was reversed in the second half of 1949, when third-quarter requirements—64,126,000 barrels—were about 9 percent over the 1948 total of 58,976,000, and the October–December demand of 98,672,000 barrels was slightly above the 97,513,000 required in the similar period of 1948. A sharp upward trend in the domestic market for light fuel oils was evident in the first quarter of 1950, when the total of 125,494,000 barrels for the period was 15 percent above the 1949 item of 108,958,000 and also somewhat over the former record volume of 114,776,000 reported for the initial quarter of 1948, when a very cold January forced up the demand for heating oils.

The 1949 survey made by the Bureau of Mines, covering sales of fuel oils, is incomplete at the time this review is written; however, an estimate of the principal demands for distillate grades of fuel oil, as based on available information from various independent sources, is as follows, with quantities in barrels: Railroads, 38,700,000; vessels, 13,400,000; gas and electric power plants, 13,800,000; smelters, mines, and manufacturing plants, 27,500,000; heating oils, 190,500,000; No. 1 fuel oil sold as range oil, 12,300,000; military uses, 7,500,000; oil-company uses, 2,800,000; and miscellaneous uses, 21,500,000.

TABLE 70.—Sales of distillate fuel oil[1] in the United States, 1944–48, by uses[2]

[3] These totals involve some duplication owing to rehandling of fuel oil initially sold to the Government.

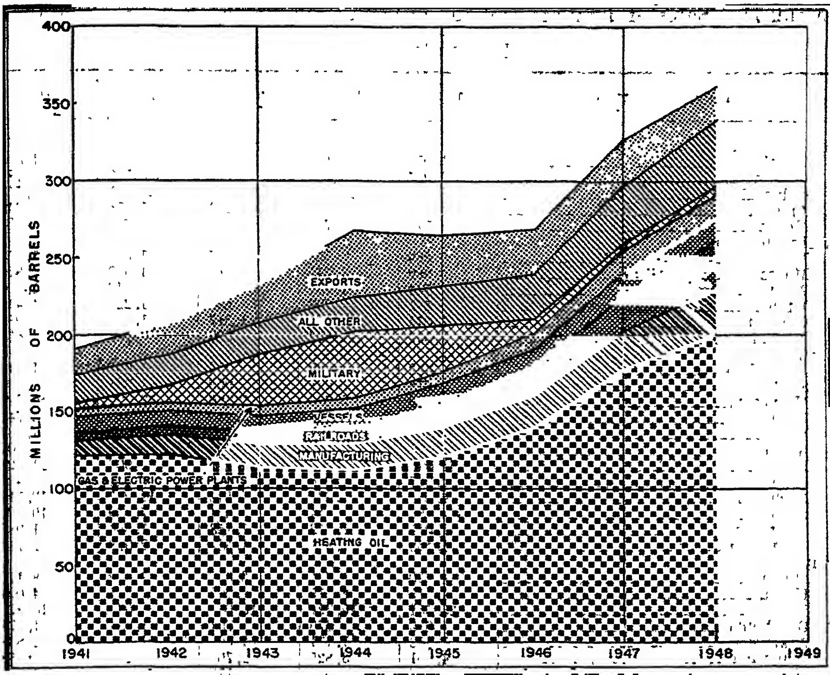

FIGURE 10.—Sales of distillate fuel oil, including Diesel oil and range oil, in the United States, 1941–48, by uses.

Reported sales of distillate fuel oils rose from 298,014,000 barrels in 1947 to 340,139,000 in 1948—a gain of 14 percent. Virtually all uses showed large gains. Railroads bought 31 percent more light fuel oils, mostly Diesel grade, in 1948, and the total for smelters, mines and manufacturing industries was a fifth over 1947 requirements. Oil companies used 65 percent more light fuel oil in their field, pipeline, and refinery operations in 1948 than in 1947, and sales to military forces were larger by 40 percent. The demands for heating oils and for No. 1 oil for range burner fuel were also up substantially—12 and 16 percent, respectively. Gas and electric power utilities brought only 5 percent more of distillate fuel oils in 1948 than in 1947, and the quantity credited to vessels was virtually the same for both years.

Consumers in all parts of the country bought more distillate fuel oil in 1948 than in 1947. About a third of all sales was reported from the Middle Atlantic States, and the demand there was greater by 13 percent in 1948. Over a quarter of the market is in the North Central region, and sales in the area in 1948 were 14 percent above 1947 requirements. Oil companies operating in the Pacific coast area sold 13 percent of the distillate fuel oil in 1948 and the volume was 12 percent over the 1947 total. Deliveries in New England (about 12 percent of the total) were greater by 10 percent in 1948, and the gain in the South Central States (10 percent of all sales) was 24 percent over the 1947 total. Only relatively small amounts of

[1] Includes Diesel fuel oil.
[2] Figures for 1949 not available when table was compiled.
[3] States are grouped according to petroleum-marketing territories rather than to conventional geographic regions.
[4] These totals involve some duplication owing to rehandling of fuel oil initially sold to the Government

light fuel oils are sold in the South Atlantic and Rocky Mountain regions; however the quantities for these areas were up 14 and 30 percent, respectively, in 1948 over 1947 totals.

Exports and shipments of distillate fuel oil to noncontiguous territories have dropped from a wartime "peak" of 43,491,000 barrels in 1944 to 21,293,000 in 1948 and 12,189,000 in 1949. This decline in United States exports in recent years was to be expected as supplies of fuel oil from foreign sources approached peacetime levels. Im-

portant quantities credited to various countries have changed as follows: Canada, 5,488,000 barrels in 1948 and 2,746,000 in 1949; United Kingdom, 4,934,000 in 1948 and 2,314,000 in 1949; Sweden, 853,000 in 1948 and 675,000 in 1949; and Denmark, 464,000 in 1948 and 587,000 barrels in 1949. Shipments of 1,060,000 barrels of distillate fuel oil to the Netherlands Antilles in 1948, believed to be for cracking into other products, were not repeated in 1949.

Refining companies produced 380,700,000 barrels of distillate fuel oils in 1948 (yield 18.7 percent) and 339,530,000 in 1949, representing a yield of 17.4 percent. The quantities and yields for the 2 years are not comparable, as the production and percentage yields in 1948 were based only on the crude petroleum processed at refineries, while in 1949 both crude and rerun material were taken into account. A table of salient statistics for distillate fuel oil included in this review shows the production and yields by months and refinery districts for both 1948 and 1949.

Pipeline companies use some light crude oil as fuel in operating their lines. These quantities are entered into the distillate fuel-oil account as "transfers" and represent about 1 percent of the total supply. "Transfers" dropped from 3,543,000 barrels in 1948 to 2,701,000 in 1949—a 24-percent shrinkage. The larger share of the "transfers" was made in the Texas inland refinery district, and there the total declined from 1,217,000 barrels in 1948 to 1,032,000 in 1949. Relatively important quantities were also credited to the Indiana-Illinois-Kentucky district (563,000 barrels in 1948 and 426,000 in 1949); Oklahoma-Kansas-Missouri district (660,000 barrels in 1948 and 495,000 in 1949); and Texas Gulf coast district—502,000 barrels in 1948 and 376,000 in 1949. No light crude oil was transferred to the distillate fuel-oil supply in the east coast, Appalachian, and California refinery districts in 1949.

Imports of distillate fuel oils declined by a third from 2,546,000 barrels in 1948 to 1,720,000 in 1949, and the respective quantities represented less than 1 percent of the total supply in both years. Over half of the 1949 total originated in Trinidad, Netherlands Antilles, Venezuela, and Colombia, while virtually all the balance came from the Near East or Saudi Arabia and Bahrein.

Stocks of distillate fuel oil—75,207,000 barrels—held at the end of 1949 were on a new basis and therefore are not comparable with those on hand at the close of 1948. Certain changes in the reporting of stocks of both crude and refined products were made in the California refinery district beginning in January 1949 in order to put them on a more comparable basis with those held east of California. The principal changes for the California area were (1) discontinuance of the separation between "gasoline bearing" and "heavy" crude stocks; (2) shift of cracking stock from the distillate and residual fuel oil inventory to "other unfinished" oils; and (3) elimination from bulk terminal stocks of certain quantities of refined products held in distributors' tanks. Furthermore, additional information about stocks in other refinery districts also made some revision necessary.

Tanker shipments of distillate fuel oil from California to the east coast rose from 161,000 barrels in 1947 to 1,177,000 in 1948. This

unusual increase, which was due to a temporary shortage in certain eastern areas in the early months of 1948, was not repeated in 1949, when the total for the year declined to 66,000 barrels. Rail and truck shipments of distillate fuel oil from the California refinery district to other Western States declined from 1,250,000 barrels in 1948 to 849,000 in 1949, while receipts in the west coast marketing area from other States increased from 333,000 barrels in 1948 to 1,413,000 in 1949.

The quantity of distillate fuel oil shipped by tanker and barge from the Gulf coast to ports along the Atlantic coast declined slightly from 104,609,000 barrels in 1948 to 102,147,000 in 1949, according to records compiled by the Oil and Gas Division, United States Department of the Interior. Texas was credited with 85,190,000 barrels of the above totals in 1948 and 80,748,000 in 1949, while the balance—19,419,000 barrels in 1948 and 21,399,000 in 1949—came from Louisiana. Fairly important quantities of distillate fuel oil are also shipped from the Gulf area up the Mississippi River and its tributaries to markets in districts 1, 2, and 3. Official records show that the volume of these shipments declined from 5,031,000 barrels in 1948 to 4,796,000 in 1949. Texas supplied 716,000 barrels of this demand in 1948 and 1,209,000 in 1949, and Louisiana 4,200,000 barrels in 1948 and 2,961,000 in 1949, while the remaining 115,000 barrels in 1948 and 626,000 in 1949 originated in Mississippi and Arkansas. District 1 received 119,000 barrels of these distillate fuel oil shipments in 1948 and 69,000 in 1949; district 2, 4,444,000 barrels in 1948 and 4,421,000 in 1949; and district 3, 468,000 barrels in 1948 and 306,000 in 1949.

Tanker rates for No. 2 distillate fuel oil shipped from the Gulf to the New York area were changed frequently in both 1948 and 1949. The freight charge for this grade of fuel oil carried in this traffic was $2.565 a long ton or 34 cents a barrel as of December 31, 1948. The quotation was advanced to 37.8 cents a barrel on January 5, 1949, and then there was a steady downward trend to 16 cents a barrel as of August 10. The rate netted upward during the summer and fall months of 1949 and finally ended at 37.8 cents a barrel on December 21, the same as it had been at the beginning of the year. The weighted average tanker rate for 1949 on distillate fuel oil carried in this movement was 27.3 cents a barrel compared with 50 cents a barrel in 1948.

Prices of distillate fuel oils, which showed some leveling off in 1948, continued downward in 1949. The market quotation for No. 2 Straw fuel oil at refineries in Oklahoma declined from an average of 8.87 cents a gallon in December 1948 to 7.25 cents for July 1949. There was a slight "mark-up" as the fall and winter demand influenced the market until the price reached an average of 7.63 cents for the closing month of the year. The weightd average for all of 1949 was 7.73 cents a gallon for this grade compared with 9.67 cents in 1948. The New York Harbor price for No. 2 fuel oil followed a similar pattern, declining from an average of 9.24 cents a gallon in December 1948 to 7.5 cents in June and July 1949. It then turned upward to 8.59 cents in October; however, subsequent changes brought it down to 8.3 cents a gallon in November and 8.4 cents in December 1949. The year's weighted average was 9.71 cents a gallon for 1948 and 8.17 cents for 1949.

Most of the light Diesel fuels averaged lower in 1949 than in 1948. Diesel oil at shore plants around New York Harbor was quoted at 9.65 cents a gallon in December 1948. The price declined to 7.9 cents a gallon in the middle of 1949 and then rose to 9 cents in the final quarter. The average for all of 1949 was 8.76 cents a gallon compared with 9.77 cents in 1948. Diesel oil for ships at the port of New York was priced at $4.02 a barrel in December 1948, and subsequent reductions brought the quotation down to $3.40 a barrel during the midyear 1949. This value was followed by an increase to $3.70 a barrel for the final quarter and a $3.65 average for all of 1949 compared with $4 in 1948. The price of Diesel fuel for ships' bunkers at New Orleans followed a similar trend, which resulted in a average of $3.33 a barrel for 1949 against $3.64 in 1948. Diesel fuel for vessels loading at San Pedro, Calif., was raised to $3.35 a barrel on December 14, 1948, and that quotation remained unchanged throughout 1949, which made the price somewhat above the weighted average of $3.20 a barrel in 1948.

Retail prices of fuel oils for a number of cities are published monthly by the Bureau of Labor Statistics, United States Department of Labor. The price of No. 2 fuel oil at New York averaged 12.71 cents a gallon in December 1948 and 12.74 cents in January 1949. There was a subsequent downward trend to 10.20 cents a gallon in August, and following this the price advanced with minor interruptions to an average of 12.02 cents in December 1949. The quotation for No. 2 distillate fuel oil at Chicago was 13.57 cents a gallon at the end of 1948 and then a slight advance to 13.67 cents held during the first quarter of 1949. The summer price went down to 11.53 cents a gallon, but this was raised to 11.93 cents in the closing months of 1949.

RESIDUAL FUEL OIL

Due to some major changes in accounting methods, the salient statistics for residual fuel oil in 1948 and 1949 are not on a comparable basis. The production, imports, and transfers from crude were not quite adequate to satisfy the export and domestic demands in 1949; consequently, a small amount (less than 1 percent of all requirements) was withdrawn from storage to make up the definciency. Production, imports, and transfers of residual fuel oil in 1948 were not only adequate for all market demands, but there was in addition a large surplus, which was diverted to stocks.

A review of the domestic demand for residual fuel oil by quarters in 1949 shows losses in the first two quarters compared with 1948 and gains in the closing periods, which changes are just the reverse of what happened in 1948, when there was a rising market in the first half of the year compared with 1947, followed by declines in the final quarters. It should be added that the quarterly demand totals for 1949 were all below comparative quarterly requirements of 2 years previous or for 1947.

The domestic demand for residual grades of fuel oil of 135,352,000 barrels in the first quarter of 1949 was about 5 percent below the corresponding total of 141,894,000 indicated for the same period of 1948, and the decline was even more pronounced (11 percent) in the second

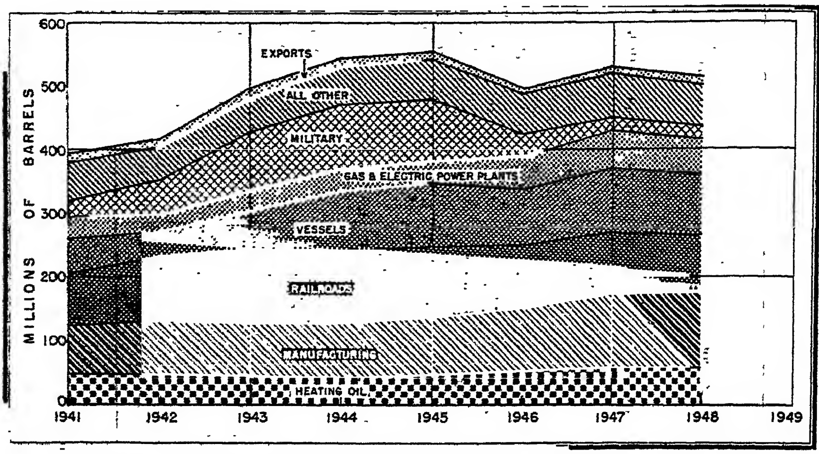

FIGURE 11.—Sales of residual fuel oil in the United States, 1941–48, by uses.

quarter, when requirements were only 108,340,000 barrels compared with 121,495,000 in the similar 3 months of 1948. There was some evidence of an upward turn in the domestic demand in the third quarter, when the total of 113,602,000 barrels was about 2 percent above the comparative item of 111,706,000 for 1948. This expansion in the demand was even more pronounced in the closing period of 1949, when requirements for residual fuel oils of 138,027,000 barrels were 10 percent higher than the 1948 total of 125,448,000 barrels. This expanded market for heavy fuel oils continued in the opening quarter of 1950, when a record domestic demand of 150,700,000 barrels was 11 percent above the 1949 total.

The Bureau of Mines report covering sales of residual fuel oils in 1949 had not been released when this review was written; however, estimates of the principal uses for the year based on reliable sources of information are as follows: Railroads, 64,000,000 barrels; vessels, 89,000,000; gas and electric power plants, 80,000,000; smelters, mines, and manufacturing industries, 124,900,000; heating oils, 58,600,000; military uses, 17,500,000; oil-company uses, 55,000,000; and miscellaneous uses, 6,300,000 barrels.

Sales of residual fuel oil declined by about 4 percent from 520,529,000 barrels in 1947 to 502,051,000 in 1948. Purchases of heavy fuel oils by railroads, vessels, and gas and electric utilities and the quantity used by oil companies were down sharply, while amounts credited to smelters, mines, and manufacturing industries, for space heating, and for military uses showed nominal gains.

In their shift to Diesel power, the railroads bought 8 percent less heavy fuel oil in 1948 than in 1947, while quantities sold for bunkering vessels were lower by 6 percent. Sales of residual grades of fuel oil to public utilities in 1948 were 7 percent below the 1947 total; however, this was a net decline, as the gas-manufacturing companies consumed more in 1948 than in 1947, while the total for the electric power

companies was down sharply. Although petroleum-industry activities were at a higher level in 1948 than in 1947, the quantity of heavy fuel oil used by oil companies was 10 percent below 1947 requirements, probably partly due to the demand for supplies in some areas in early 1948 and also the greater use of natural gas and refinery gas as refinery fuels.

The upward trend in sales of heavy fuel oils to smelters, mines, and manufacturing plants of recent years continued in 1948, when the total was 2 percent above the 1947 demand. Residual fuel oils reported for space heating in 1948 were 4 percent greater in volume than in 1947; and the quantity credited for military uses, which has dropped sharply in recent years, turned upward again in 1948 by about 6 percent.

TABLE 74.—Sales of residual fuel oil [1] in the United States, 1944–48, by uses [2]

Exports and shipments to noncontiguous Territories	12, 536	11, 669	9, 188	10, 623	13, 011
Total	541, 948	553, 934	496, 248	531, 152	515, 062

[1] Includes Navy grade and crude oil burned as fuel.
[2] Figures for 1949 not available when table was compiled.
[3] These totals involve some duplication owing to rehandling of fuel oil initially sold to the Government.

Less residual fuel oil was sold in all regions of the country in 1948 than in 1947, except in the North Central and New England areas, where nominal gains were reported. Over a quarter of the 1948 total (26 percent) was credited to the Middle Atlantic States, where the quantity was 2 percent below 1947 requirements. Sales in the Pacific coast area declined by 13 percent and represented 23 percent of the residual fuel-oil deliveries in 1948. A similar proportion was marketed in the South Central States, but there the 1948 volume was down by less than 2 percent. In areas where gains were reported in 1948, the sales in the North Central States were greater by 6 percent and in New England 4 percent. Deliveries of residual fuel oil in these areas made up about 13 and 8 percent, respectively, of the national total in 1948. Sales of heavy fuel oils in the South Atlantic and Rocky Mountain States are relatively unimportant, and the quantities declined in 1948 compared with 1947.

Figure 11 shows graphically the changing demands for residual fuel oils in recent years. All grades of heavy fuel oils are included, including crude petroleum used as fuel.

Total	[4] 529,412	[4] 542,265	487,060	520,529	502,051

[1] Includes some crude oil burned as fuel.
[2] Figures for 1949 not available when table was compiled.
[3] States are grouped according to petroleum-marketing territories rather than to conventional geographic regions.
[4] These totals involve some duplication owing to rehandling of fuel oil initially sold to the Government.

Exports of residual fuel oil which have increased moderately in recent years declined in 1949 to 12,641,000 barrels compared with 13,011,000 in 1949—a 3-percent drop, according to reports published by the Bureau of the Census, United States Department of Commerce. The largest shares of the 1949 quantity were credited to Canada, 2,819,000 barrels; Mexico, 1,361,000; Cuba, 1,297,000; Chile, 934,000; and Guatemala, 449,000 barrels.

Residual fuel-oil production in 1948—466,317,000 barrels—and the yield of 23 percent were based only on the crude runs to stills, while in 1949 the output of 424,829,000 and the yield of 21.7 percent was figured on the quantity of crude plus unfinished oils rerun. Because of this change in accounting, the production and percentage yields of residual fuel oils in 1948 and 1949 are not comparable. The production and percentage yields for heavy fuel oils, by months and refinery districts, in 1948 and 1949 are shown in the table of salient statistics.

"Transfers" or crude oil generally considered used as fuel on leases and for industrial purposes declined from 23,847,000 barrels in 1948 to 4,750,000 in 1949. The quantities for refinery districts east of California were 4,564,000 barrels in 1948 and 3,033,000 in 1949, while the total for California dropped from 19,283,000 in 1948 to 1,717,000 in 1949. The totals for the California refinery district are not comparable as, beginning with January 1949, crude petroleum intended for charging cracking units was eliminated from this account, leaving only the crude petroleum actually used for fuel purposes. Adjusted "transfers" of 2,135,000 barrels for the California refinery district in 1948 are comparable with the 1949 item shown above.

Imports of residual fuel oil increased from 53,269,000 barrels in 1948 to 74,555,000 in 1949—a 40-percent gain. These receipts from foreign sources represented about 10 percent of the total available supply of heavy fuel oils in 1948 and a 15-percent share in 1949. Most of the residual fuel oil received from abroad comes from the Netherlands Antilles, while many other countries, such as Canada, Mexico, Trinidad, Venezuela, Colombia, Saudi Arabia, and Bahrein, are credited with small amounts.

Year-end stocks of residual fuel oils of 76,970,000 barrels in 1948 and 60,193,000 for 1949 are not comparable, because of some changes in accounting methods in the California refinery district initiated in January 1949, namely, the transfer of heavy fuel oils used for cracking stock to "other unfinished oils" and the elimination of certain stocks held in distributors' tanks formerly included in bulk terminal stocks. The table of salient statistics for residual fuel oil shows these stocks by months and refinery districts in 1948 and 1949.

There is a small overland movement of residual fuel oil by rail and truck between the California refinery district and other Western States. California shipped out 243,000 barrels in 1948 and 104,000 in 1949 in this traffic and in turn received from other western areas 511,000 barrels of heavy fuel oil in 1948 and 543,000 in 1949.

Tanker shipments of residual fuel oil from California to the east coast rose from 97,000 barrels in 1948 to 6,419,000 in 1949. The stepped-up shipments started in August 1949 with a total of 94,000 barrels and for the month of December reached 2,126,000 barrels. This accelerated movement of heavy fuel oil from California to the east coast was an effort to find a market for excessive supplies in that area and also to take advantage of the higher prices quoted in the east coast. As an example the quotation for Bunker "C" at San Pedro was $1.60 a barrel in August 1949 and had dropped to $1.25 a barrel in the final quarter of the year, while at New York the same grade rose from $1.60 a barrel in July 1949 to $2.05 in November and December. This traffic in heavy fuel oil from California to the east

coast has continued during the January–April period of 1950, when the total reached 9,241,000 barrels.

Tanker and barge shipments of residual fuel oil from the Gulf coast to the east coast declined from 68,662,000 barrels in 1948 to 67,425,000 in 1949, according to statistics compiled by the Oil and Gas Division, United States Department of the Interior. The quantity originating in Texas increased from 55,325,000 barrels in 1948 to 56,996,000 in 1949, while the total credited to Louisiana declined from 12,907,000 barrels in 1948 to 10,429,000 in 1949. Alabama shipped 430,000 barrels in this traffic in 1948 and none in 1949.

Some heavy fuel oil is also barged up the Mississippi River and its tributaries from the Gulf coast and Arkansas to terminals in districts 1, 2, and 3. The total for 1949—1,111,000 barrels—varied only slightly from the 1948 quantity of 1,057,000 barrels. Texas supplied 46,000 barrels of these 1949 barge shipments compared with 105,000 in 1948; Louisiana, 972,000 barrels in 1949 and 896,000 in 1948; and Arkansas and Mississippi, 93,000 barrels in 1949 and 56,000 in 1948. District 1 received 117,000 barrels over these inland waters from the Gulf area in 1949 and 224,000 in 1948; district 2, 865,000 barrels in 1949 and 659,000 in 1948; district 3, 129,000 barrels in 1949 and 174,000 in 1948.

Tanker rates for Bunker "C" fuel oil shipped from the Gulf coast to New York were changed numerous times in 1949, according to quotations published in Platt's Oil Price Handbook for 1949. Vessels of over 14,000 tons deadweight were charging $2.565 a long ton or 39.5 cents a barrel on December 31, 1948. As the demand for heavy fuel oil declined in the summer months of 1949, the Gulf-New York tanker rate declined to 18.6 cents a barrel on July 8 and then slowly rose to a year-end charge of 37.2 cents a barrel on December 15. The weighted average rate for all of 1949 was 28 cents a barrel compared with 58.3 cents in 1948.

The average monthly prices of representative grades of residual fuel oils, which trended upward in 1948, took a sharp drop in 1949. The price of No. 6 fuel oil at refineries in Oklahoma, which was selling at an average monthly price of $1.87 a barrel in December 1948, dropped steadily to 90 cents a barrel for July 1949. It went up slightly to 97 cents in August but declined again to 82 cents a barrel in September. The year-end demand finally pulled the quotation up to $1.03 a barrel for December. The weighted average for this grade was $1.08 a barrel for all of 1949 compared with $2.44 in 1948. No. 5 grade at New York Harbor followed a similar price pattern, dropping from a December 1948 price of $3.39 a barrel to $2.38 in June and July 1949. It gradually rose to $2.79 a barrel in November and then dropped to $2.74 in the final month of the year. The average quotation for 1949 was $2.69 against $3.71 a barrel in 1948. The price of Bunker "C" to vessels bunkering in New York Harbor was $2.78 in December 1948 and averaged $3.00 for that year. It declined to $1.60 a barrel in June and July 1949 and was up to $2.05 at the year end and averaged $1.90 for all of 1949. Bunker "C" at New Orleans varied from $2.32 in December 1948 to $1.32 in June 1949 and $1.75 in the final two months. The weighted average quotation at New Orleans was $2.51 a barrel for 1948 and $1.57 in 1949. The San Pedro price for Bunker "C" declined from the December 1948 value of $2.18 a barrel to $1.25 in the final quarter of 1949.

Retail prices of heavy fuel oils also followed a downward trend in 1949, according to records published monthly by the Bureau of Labor Statistics, United States Department of Labor. No. 6 grade, which was selling for an average of 8.08 cents a gallon in New York in December 1948, declined through a number of price cuts to an average of 4.66 cents by July, 1949. There was a gradual upturn during the second half of the year to 5.91 cents in December and an average of 5.59 cents a gallon for all of 1949 compared with an average of 9.22 cents a gallon for this grade in New York for 1948. No. 5 heavy fuel oil at Chicago was quoted at 10.47 cents a gallon during December 1948; however, by the third quarter of 1949, the retail price had dropped to 7.80 cents a gallon. There was a slight rise during the final quarter to 8.31 cents in December and an average of 8.66 cents a gallon for the entire year compared with 10.78 cents in 1948.

LUBRICANTS

The refinery production of lubricants dropped from 51.8 million barrels in 1947 to 51.4 million in 1948 and 45.4 million in 1949. The total decline in production of 6.0 million barrels in 1949 included gains of 0.8 million in the California district and 0.3 million in the Louisiana Gulf district while production in all other districts declined, including decreases of 2.5 million barrels in the east coast district, 2.3 million in the Oklahoma-Kansas district, 1.0 million in the Texas Gulf district, and 0.8 million in the Indiana-Illinois district. Production in the Appalachian district was almost static.

TABLE 77.—Salient statistics of lubricants in the United States, 1948–49, by months and districts

Month and district	Production (thousand barrels)		Yield (percent)		Domestic demand (thousand barrels)		Stocks, end of period (thousand barrels)

[1] Preliminary figures.
[2] Figures not available.

The total demand for lubricants declined from 49.4 million barrels in 1948 to 46.0 million in 1949. Exports decreased from 13.4 million to 13.0 million and domestic demand declined from 36.0 million barrels in 1948 to 33.0 million in 1949. The greater relative decline in production than in demand was due to an increase in total stocks of 2.1 million barrels in 1948 compared with a stock decrease of 0.6 million in 1949.

The downward trend in the domestic demand for lubricants, in spite of the rapid increase in the number of motor vehicles and the gain in gasoline consumption, is difficult to explain. No current figures are available as to the relative demand for industrial and automotive uses. Factors affecting automotive demand may be the growing practice of reclaiming lubricants for reuse, less frequent changes of oil, and the reduction in the average age of motor vehicles.

The accompanying table showing the prices of representative lubricating oils for 1948 and 1949 indicate sharp declines, especially for Oklahoma and Pennsylvania grades.

TABLE 78.—Average monthly refinery prices of five selected grades of lubricating oil in the United States, 1948–49, in cents per gallon

LIQUEFIED GASES

The sale of liquefied gases, included with other finished products, has expanded rapidly in the last few years and now ranks after kerosine and still gas in volume.

Liquefied gases include the transfer from natural gasoline and cycle plants of liquefied petroleum gases sold for fuel and chemical uses and the output of liquefied refinery gases. Transfers increased from 43 million barrels in 1948 to 45.7 million in 1949, while refinery production declined from 23.7 million barrels in 1948 to 23.1 million in 1949.

The total demand for liquefied gases rose from 54 million barrels in 1947 to 66.6 million in 1948 and 68.9 million barrels in 1949. Exports amounted to 1.3 million barrels in 1947, 1.1 million in 1948, and 1.3 million in 1949. Domestic demand was 52.7 million barrels in 1947, 65.5 million in 1948 and 67.6 million barrels in 1949. The increase in domestic demand, on a daily average basis, was only about 3 percent in 1949, compared with gains of 23 percent in 1948 and 33 percent in 1947. The details of the sales of liquefied gases by types and uses can be found in a separate section of the Natural Gasoline chapter of the Minerals Yearbook.

OTHER PRODUCTS

Wax.—The refinery production of wax declined from 3,515,000 barrels in 1948 to 3,208,000 in 1949, converted from pounds at the rate of 280 pounds to the barrel. The total decrease in production amounted to 307,000 barrels, representing gains of 97,000 in the California district, 90,000 in the Texas Gulf and 3,000 in the Appalachian district, and declines of 241,000 barrels in the East Coast district, 130,000 in the Oklahoma-Kansas district, 62,000 in the Louisiana Gulf, 30,000 in the Indiana-Illinois district, 29,000 in the Rocky Mountain district, and 5,000 barrels in the Texas Inland district. Production in the east coast district represented 38.2 percent of the total in 1948 and 34.3 percent in 1949.

Stock declined 78,000 barrels during 1949 and total demand amounted to 3,286,000 barrels, including exports of 1,030,000 barrels and a domestic demand of 2,256,000 barrels. The average refinery price of white crude scale wax at Pennsylvania refineries declined sharply from 8.01 cents per pound in 1948 to 4.85 cents in 1949.

Coke.—The production of petroleum coke continued to increase in 1949, amounting to 17.0 million barrels compared with 14.5 million in 1948 (converted at the rate of 5 barrels to the short ton). Output increased in all the producing districts, with gains of 0.9 million barrels in the Indiana-Illinois district, 0.4 million in the Oklahoma-Kansas district, about 0.3 million each in the California, east coast, and Rocky Mountain districts, and 0.2 million barrels in the Louisiana Gulf district. The Indiana-Illinois district is the largest producer, representing 47.6 percent of the total output in 1949 compared with 49.6 percent in 1948.

[1] Conversion factor: 5.0 barrels to the short ton.
[2] Preliminary figures.
[3] Figures not available.

The total demand for petroleum coke amounted to 16.9 million barrels in 1949—a gain of 2.7 million compared with 1948. Domestic demand increased from 11.7 million barrels in 1948 to 14.4 million in 1949, while exports were about the same.

Asphalt and Road Oil.—The total demand for asphalt declined from 51.6 million barrels in 1948 to 50.9 million in 1949 (converted at the rate of 5.5 barrels to the short ton). Domestic demand decreased from 50.0 million barrels in 1948 to 49.4 million in 1949, while there was a small decline in exports. The domestic demand for road oil amounted to 8.0 million barrels in 1948 and 7.8 million in 1949. The details as to total sales of asphalt and types of product are contained in a separate chapter.

Still Gas.—The production of still gas increased from 81.2 million barrels equivalent in 1948 to 82.6 million in 1949. Production, in cubic feet, rose from 292.2 billion in 1948 to 297.4 billion in 1949.

[1] Preliminary figures.

Miscellaneous Finished Products.—The production of miscellaneous finished products at refineries in the United States amounted to 4,031,000 barrels in 1949, compared with 6,188,000 barrels in 1948. This decline reflects in part a decrease in refinery operations and demand for specialty products in 1949. The abrupt decline in production of "other" miscellaneous products from 2,453,000 barrels in 1948 to 597,000 barrels in 1949 is accounted for chiefly by reclassification of certain products formerly reported in this group to other types of finished products. In some instances these materials were utilized for specialized purposes but are appropriately classed with motor fuel as light fuel oils on the basis of quality.

TABLE 83.—Production of miscellaneous finished oils in the United States in 1949, by districts and classes

[Thousands of barrels]

District	Petrolatum	Absorption oil	Medicinal oil	Specialties	Solvents	Other	Total
East Coast	43	9	67	124	76		319

California		10	38	579	16	489	1,132
Total	735	1,001	117	1,407	174	597	[1] 4,031

[1] Difference between the refinery output of other finished products and this total is due to reclassification of products.

INTERCOASTAL SHIPMENTS [2]

Shipments of mineral oils, crude and refined, from Gulf coast ports to east coast ports were 9 percent lower in 1949 than in 1948. Crude petroleum was the largest single item in 1948; it constituted 35 percent of the total shipments. But a 27-percent decrease of these intercoastal shipments of crude petroleum caused it to drop to second place; it made up only 28 percent of the total in 1949. Gasoline, which held second place in 1948 with 26 percent of the total, gained first place in 1949 with 30 percent of the total.

The decreased shipments of crude petroleum from the Gulf coast to the east coast may be ascribed to smaller refinery runs and to greater receipts of foreign crude at east coast refineries. Greater demand for gasoline on the east coast caused the 7-percent increase in intercoastal shipments of motor fuel. Shipments of other refined products from the Gulf coast to the east coast were all lower in 1949 than in 1948; for kerosine the decrease was 12 percent.

Intercoastal shipments of refined oils from California to east coast ports, which had amounted to only 740,000 barrels in 1946 and 945,000 barrels in 1947, increased from 2,088,000 barrels in 1948 to 7,566,000 barrels in 1949. The principal items in these shipments during 1949 were residual fuel oil (6,419,000 barrels), gasoline (742,000 barrels), and lubricating oils (273,000 barrels).

FOREIGN TRADE [3]

Imports of mineral oils, crude and refined, into continental United States increased 24 percent from 1948 to 1949. They constituted 8 percent of the total new supply in continental United States in 1948 and 10 percent in 1949. Total imports exceeded total exports by 40 percent in 1948 and by 96 percent in 1949.

Crude petroleum, distillate fuel oil, and residual fuel oil together made up 98 percent of the total mineral-oil imports into continental United States in 1948 and 99 percent in 1949. Crude petroleum alone constituted 69 percent of the total in 1948 and 66 percent in 1949. Venezuela supplied 50 percent of the total imports into the United States in 1948 and 44 percent in 1949; the Netherlands Antilles 30 percent both in 1948 and 1949; and Mexico 3 percent in 1948 and 4 percent in 1949. A newer source of supply, the countries surrounding the Persian Gulf, furnished 12 percent of the total in 1948 and 16 percent in 1949.

Of the crude petroleum imported into continental United States, Venezuela furnished 69 percent of the total in 1948 and 63 percent in 1949; the Netherlands Antilles 4 percent in 1948 and 3 percent in 1949; Colombia 7 percent both in 1948 and in 1949; and Mexico 3 percent in 1948 and 4 percent in 1949. Countries surrounding the Persian Gulf supplied 18 percent of the total in 1948 and 23 percent in 1949.

The Netherlands Antilles provided 94 percent of the residual fuel oil imported into continental United States and the noncontiguous territories in 1948 and more than 92 percent in 1949. Venezuela furnished an additional 5 percent in 1949 and other countries of the Western Hemisphere 2 percent.

Caribbean countries and Mexico, which had shipped 76 percent of the distillate fuel oil received in continental United States and the noncontiguous territories in 1948, accounted for 69 percent of such imports in 1949. Middle eastern countries, which had supplied 24 percent of the total distillate imports in 1948, furnished 28 percent in 1949.

[2] Includes free for supplies of vessels and aircraft.
[3] Includes free for manufacture in bond and export, and for supplies of vessels and aircraft.
[4] Less than 1,000 barrels.

EXPORTS

Continental United States, formerly a net exporter of mineral oils, continued in 1949 to be a net importer. The excess of all petroleum imports over all petroleum exports—53 million barrels in 1948—was increased in 1949 to nearly 115 million barrels, as more crude petroleum and residual fuel oil were imported and exports of other refined products were reduced by the general shortage of dollar credits in foreign countries and the competition of new, enlarged, and rehabilitated refineries in Europe and the Middle East.

The excess of imports was chiefly in crude petroleum, increasing from 89 million barrels in 1948 to 122 million barrels in 1949, and in residual fuel oil, increasing from 40 million barrels in 1948 to 62 million barrels in 1949. With regard to other refined products, however, exports exceeded imports by 76 million barrels in 1948 and 69 million barrels in 1949.

[1] Compiled from records of U. S. Department of Commerce; figures may differ slightly from those used throughout other sections of this report.
[2] Includes benzol, natural gasoline, and antiknock compounds.
[3] Preliminary figures.

Exports of crude petroleum decreased 17 percent from 1948 to 1949. Canada received 84 percent of the exports in 1948 and 91 percent in 1949. France, which in 1939 took 21 percent of the crude-oil exports of the United States, took 8 percent in 1948 but only a little more than 1 percent in 1949. Cuba accounted for 4 percent of the total in 1948 and 5 percent in 1949 and the United Kingdom for a little more than 1 percent in both years. None was shipped to the noncontiguous territories.

Exports and territorial shipments of refined oils as a whole were 9 percent lower in 1949 than in 1948. Decreases and increases varied considerably among the major products.

Motor-fuel exports and shipments were 6 percent larger in 1949 than in 1948. Increased exports to Mexico, Central America, and the West Indies, to South America, to western Europe (except United Kingdom), to Africa, and to Australia offset decreased exports to eastern Asia and to the United Kingdom.

[1] Compiled by M. B. Price and E. D. Page, oft he Bureau of Mines, from records of the U. S. Department of Commerce.
[2] Changes for table in Minerals Yearbook, 1948, pp. 1018–1020, are as follows: 1948—Motor fuel exported to New Zealand, 408 barrels; total Oceania, 1,286; grand total, 32,700; total net shipments, 35,041. Fuel oil—Canada, 9,380 barrels; total North America, 15,791; grand total, 27,920; total net shipments, 29,594. Lubricating oils—Australia, 599 barrels; New Zealand, 174; total Oceania, 778; grand total, 12,855; net total 12,923.
[3] Includes natural gasoline, naphtha, benzol, and antiknock compounds.
[4] Less than 1,000 barrels.

Outward shipments of kerosine were 28 percent less in 1949 than in 1948. The decreases were general, but were greatest in shipments to North American countries. Only shipments to Africa and to the noncontiguous Territories formed an exception to the general decline.

Exports and territorial shipments of distillate fuel oil decreased 43 percent from 1948 to 1949. The decrease was general but was greatest in exports to Canada and to the United Kingdom. Only shipments to African countries formed an exception to the general decrease.

Outward shipments of residual fuel oil were 3 percent less in 1949 than in 1948. Decreased exports to Canada, Central America and the West Indies, Europe, and China and Hong Kong were nearly balanced by increased shipments to South America, Cuba, Japan, the Philippine Islands, and the noncontiguous territories in particular.

Lubricating-oil exports and shipments decreased 3 percent from 1948 to 1949. The principal decreases were in exports to Europe other than the United Kingdom, to South America, and to India. Increases in exports to other destinations did not suffice to offset the decreases in exports to the destinations named.

WORLD PRODUCTION

For the first time since 1942, the world production of crude petroleum declined; it was 1 percent less in 1949 than in 1948. Curtailments in the United States and Venezuela, the two leading producers, were the chief factors in the decline. For the other major producing countries, petroleum output was larger in 1949 than in 1948.

The Western Hemisphere supplied 78 percent of the total production in 1948 and 73 percent in 1949. The United States alone furnished 59 percent of the world output in 1948 and 54 percent in 1949. Venezuela, the second-largest producing country, supplied 14 percent of the total both in 1948 and in 1949. The Middle East (Bahrein Island, Iran, Iraq, Kuwait, Qatar, Saudi Arabia, Turkey, and Egypt) increased its share from 13 percent in 1948 to 16 percent in 1949.

Petroleum production in the United States decreased 9 percent from 1948 to 1949. Canada, however, as a result of activity in Alberta, had a high proportional increase in the same period—81 percent. Mexico's production was 4 percent larger in 1949 than in 1948. Trinidad produced 3 percent more petroleum in 1949 than in 1948.

[1] Preliminary figures.
[2] Less than 500 barrels.
[3] Natural naphtha and gas oil.
[4] Estimate.
[5] Data represents Trianon Hungary after October 1944.
[6] Data revised in accordance with recent information stating 6.3 barrels per metric ton.
[7] Beginning in 1945, postwar borders.
[8] U. S. S. R. in Asia (except Sakhalin) included with U. S. S. R. in Europe.
[9] Includes New Guinea whose production amounted to 1,725,500 barrels in 1949.
[10] Included with India.

Crude-petroleum production in western Europe continued to increase. In Germany increased yields in Emsland and other new fields compensated for declines in the output of the older salt-dome fields. In the Netherlands, drilling enlarged the boundaries of the Schoonebeek field and increased the petroleum production of the country. In Austria the new Matzen field made up for declines in the older fields, so that the petroleum production of the country was little changed from 1948 to 1949.

For eastern Europe exact statistics are generally lacking. The U. S. S. R. apparently increased its production 7 percent from 1948 to 1949. Both Poland and Rumania are estimated to have had lower production in 1949 than in 1948.

The most spectacular gains in petroleum production were in the Middle East. Saudi Arabia produced 22 percent more petroleum in 1949 than in 1948. Two new fields were discovered. Kuwait nearly doubled its output from 1948 to 1949 by virtue of increased exports to France, the United States, and the United Kingdom. A new 20,000-barrel refinery began operations in December 1949. The opening of an additional pipeline from Kirkuk to Tripoli, Lebanon, permitted crude output in Iraq to increase 19 percent from 1948 to 1949. In Egypt, new fields on the Sinai Peninsula increased petroleum production 19 percent from 1948 to 1949. However, Iran, largest producer of the Middle East, had a smaller proportional increase of 7 percent; greater output from the Agha Jari field offset declines in the older fields of Masjid-i-Suleiman, Haft Kel, and Gach Saran.

Eastern Asia continued its recovery from war damages and political unrest. Reconstruction and political settlement in the United States of Indonesia and the beginning of commercial production in New Guinea raised the petroleum production of the islands 41 percent from 1948 to 1949. In British Borneo the 1949 output was 25 percent larger than in 1948 and three and one-half times that of 1939.

Phosphate Rock

By Bertrand L. Johnson and E. M. Tucker

GENERAL SUMMARY

MINED production of phosphate rock in the United States in 1949 dropped from the record high of 1948 (9,388,160 long tons) to 8,877,474 tons, according to reports submitted by producers to the Bureau of Mines, a decline of over half a million tons. Decreases were shown in Florida and Tennessee, whereas there was a considerable increase in the mined production of western rock, which, however, did not approach the 1947 record high. Supplies of phosphate rock were plentiful and adequate to meet demands.

In contradistinction to the trend in the mined production, that of the sold or used phosphate rock turned slightly upward, from 8,668,769 long tons in 1948 to 8,986,933 tons in 1949. (See fig. 1.) Decreased

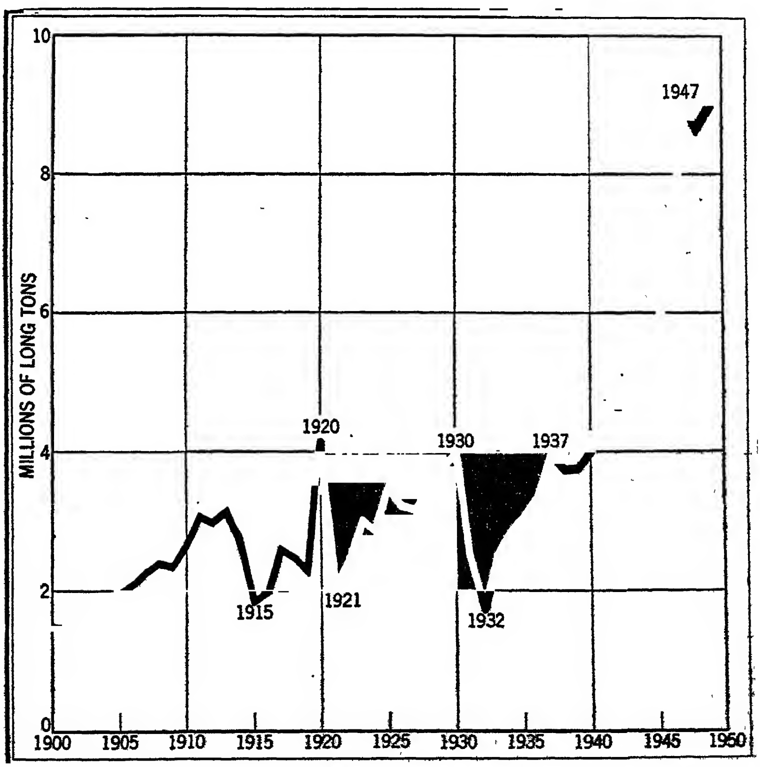

FIGURE 1.—Marketed production of domestic phosphate rock, 1900–49.

sales of Idaho and Wyoming phosphate rock were more than compensated by increases of Florida, Tennessee, and Montana rock. The total value of the phosphate rock sold or used in 1949 rose to $51,415,027, slightly over $900,000 above the 1948 level. The P_2O_5 content of the rock sold or used in 1949 increased to 2,913,796 long tons from 2,810,206 in 1948. This was a new record high, nearly 11,000 tons above the previous record of 1947 (2,903,082 tons). Imports increased both in quantity and value in 1949. Exports in 1949, as reported by producers, were likewise above those in 1948 in both categories. Apparent domestic consumption increased slightly in 1949, to 7,735,005 long tons. Stocks at the end of 1949 had declined sharply, principally in Florida.

Salient statistics of the phosphate-rock industry in the United States, 1948–49

	1948				1949

[1] Includes small quantity of apatite from Virginia in 1940–47, and in 1940–43 some matrix of washer grade.

SALES

A considerable increase in the quantity of phosphate rock sold or used by domestic producers brought the total for the United States in 1949 to 8,986,933 long tons.

Phosphate rock sold or used by producers in the United States, 1945–49

Year	Long tons	Value at mines: Total	Value at mines: Average	Year	Long tons	Value at mines: Total	Value at mines: Average

[1] Bone phosphate of lime, $Ca_3(PO_4)_2$.
[2] Includes a small quantity from Virginia in 1945–47 and in 1949.
[3] Less than 0.5 percent.

CONSUMPTION AND USES

The apparent consumption of phosphate rock in the United States in 1949 increased to 7,735,005 long tons from 7,700,081 tons in 1948, an increase of nearly 35,000 tons.

Apparent consumption [1] of phosphate rock in the United States, 1945–49, in long tons

PRICES

Prices for Florida land-pebble phosphate rock and for Tennessee brown-rock phosphate moved in opposite directions in 1949. A decline in Florida prices occurred early in the year following a downward revision in the price of fuel oil at Tampa, Fla. In the fall of 1949, fuel-oil prices were raised, and the price of the Florida land pebble advanced slightly, but not to the levels prevailing in the early months of the year. Tennessee price advanced early in the year and retained the new level for the remaining months. The advance was attributed to an increased price for coal. The accompanying table gives the price quotations of Oil, Paint and Drug Reporter at the beginning, middle, and end of 1949 for Florida and Tennessee phosphate rock. Tennessee quotations are now given on a P_2O_5 basis, instead of the B. P. L. content formerly used. Quotations for Western States phosphate rock are not given in the trade journals.

Prices per long ton of Florida and Tennessee unground, washed, and dried phosphate rock, in bulk, f. o. b. cars at mine, by grades, in 1949–50

[Oil, Paint and Drug Reporter]

REVIEW BY STATES

SOUTHERN STATES

Florida.—The upward trend in the marketed production of Florida phosphate rock continued in 1949. A new high record of 6,815,989 long tons valued at $37,857,983 was made. The greater part of the production came from the land-pebble field, relatively small quantities of hard rock and soft rock (waste-pond phosphates from the hard-rock field) being produced. The production of the latter kind much exceeded that of the hard rock.

The land-pebble phosphate-rock companies mining and shipping phosphate rock in 1949 were the American Agricultural Chemical Co. (Pierce); American Cyanamid Co. (Brewster); Coronet Phosphate Co. (Plant City); Davison Chemical Corp. (Ridgewood); International Minerals & Chemical Corp. (Mulberry); Swift & Co. (Agricola); and the Virginia-Carolina Chemical Corp. (Nichols). The Pembroke Chemical Corp. (Pembroke) did no mining in 1949 but made some shipments. The Armour Fertilizer Works was not yet in production.

The American Agricultural Chemical Corp. operated its No. 3, 11, and 12 mines and washers, its tabling plant, and its drier at Pierce. The American Cyanamid Co. reports that phosphate rock was recovered from its Saddle Creek and Sidney mines and washers and dried

[1] Includes material from waste-pond operations.

at its Brewster drier. A new flotation plant was started by this company at Sidney, between Mulberry and Tampa. The Coronet Phosphate Co. operated its Eleanor mine, washer, and flotation unit, drying the phosphate rock produced at its Coronet drier.

The Davison Chemical Corp. operated its Bonny Lake and Pauway No. 4 mines and washers and dried the washed rock at its Ridgewood drying plant. In January 1949 the Davison Co. placed a new phosphate flotation plant in operation south of Lakeland, Fla. This plant [2] is an addition to the Pauway No. 4 washer and table plant that processes the material from its No. 4 mine.

The International Minerals & Chemical Corp. operated its Noralyn, Peace Valley, and Achan mines and washers and its Noralyn and Prairie driers in 1949. The Achan mine and washer were in operation only during the last 5 months of the year. During the fiscal year ended June 30, 1949, new drying, storage, and shipping facilities were installed at the Noralyn mine. One drying unit measured 8 by 80 feet. The tonnage shipped by the company in March 1949 was the highest for any month in its history. A strike in May and June 1949 stopped all operations of the company for 7 weeks.

Swift & Co. operated its Swift No. 5 and Swift No. 6 mines and washers, drying the phosphate rock produced at its Agricola drying plant. Triple superphosphate is reported as produced at its new Agricola facilities. The Virginia-Carolina Chemical Corp. operated its Homine mine and washer and mined feed from the Phosmico debris dumps. Most of the phosphate rock recovered was dried at the Phosmico and Nichols drying plants. Some was calcined.

[2] Sauchelli, Vincent, Davison's Pauway Plant Uses New Techniques: Commercial Fertilizer, vol. 79, No. 2, August 1949, pp. 20–22.
Lenhart, W. B., High Phosphate Recovery Through Use of Froth Flotation: Rock Products, vol. 52, No. 8, August 1949, pp. 105–108, 130.

The Pembroke Chemical Corp. reports that it did no mining in 1949 but shipped several thousand tons of phosphate rock from stock. Some purchased rock was exported for its account. The Armour Fertilizer Works report that there were no phosphate-mining operations or shipments at its Florida plant. Its new triple superphosphate plant near Bartow is now in operation, using dry-ground Florida phosphate rock and sulfuric acid to make, first, phosphoric acid, and then, the triple superphosphate.

Uranium has been detected in the marine land-pebble phosphate-rock deposits of Florida. The deposits have been under investigation since 1947 by the United States Geological Survey and the Atomic Energy Commission. Whether the uranium deposits are of economic importance has not been disclosed.

In the hard-rock phosphate field, C. & J. Camp (P. O. Box 608, Ocala, Fla.) and J. Buttgenbach & Co. (P. O. Box 67, Lakeland, Fla.), who had operated the Section 12 mine near Dunnellon jointly in recent years, were succeeded on January 1, 1949, by the Kibler-Camp Phosphate Enterprise (P. O. Box 608, Ocala, Fla.), now the only hard-rock phosphate operator in Florida. Operations were continued at the Section 12 mine, and shipments were made both for domestic consumption and for export.

The processing plant of the Fernandina (Fla.) Phosphate Corp. at Fernandina used in the past for drying and crushing hard-rock phosphate for loading on ships for export was shut down early in 1949, although vessels called thereafter to load the remainder of the stocks. The company is reported to have announced on July 5 that it could see "no more future in the export of phosphate through Fernandina."

Several soft-rock phosphate mining companies were in operation in 1949, mining the fine-grained phosphatic residues in the old waste-pond dumps near Dunnellon, Hernando, and Clark, in the hard-rock-phosphate field. Part of this material was sold for use as a phosphate fertilizer for direct application to the soil, part for use as a filler in commercial mixed or complete fertilizers, and part for stock and poultry feed. No production or shipments are reported from the phosphatic clay operation at Bartow in the land-pebble phosphate-rock area, and this company is stated to be no longer in operation.

Several general papers on the phosphate-rock industry of Florida have appeared recently.[3]

South Carolina.—No production of phosphate rock came from the deposits in South Carolina in 1949. One of the major domestic phosphate-rock-mining companies—the Virginia-Carolina Chemical Corp.—began erection of an electric furnace for producing elemental phosphorus north of Charleston, S. C., in 1949. The dedication ceremony was held at the site on October 18, 1949. Phosphate rock for the furnace will be hauled by rail from the company mines in the Florida land-pebble field.[4] The furnace is situated on the site of the first commercial phosphoric acid plant in the United States using the

"wet process." This was erected and operated by the Virginia-Carolina Chemical Corp. in 1907.

Tennessee.—Tennessee retains its position as the second-largest phosphate-rock-producing State. In 1949 the quantity of phosphate rock sold or used by Tennessee producers was nearly 40,000 long tons (36,963 tons) greater than in 1948, rising from 1,307,507 long tons in that year to 1,344,470 tons in 1949. The total value in 1949 increased $836,338 over 1948, according to reports from producing companies, and rose to $9,067,589.

Tennessee brown-rock phosphate-mining operations in 1949 were carried on by the Tennessee Valley Authority (Columbia, Tenn.) and by several private companies: Armour Fertilizer Works (Room 350, Hurt Bldg., Atlanta, Ga.); Federal Chemical Co. (634 Starks Bldg., Louisville, Ky.); Harsh Phosphate Co. (Route 1, Murfreesboro Road, Nashville, Tenn.); Hoover & Mason Phosphate Co. (8 Michigan Ave., Chicago, Ill.); International Minerals & Chemical Corp. (20 North Wacker Dr., Chicago, Ill.); Monsanto Chemical Co. (1700 South 2d St., St. Louis, Mo.); Owens Agricultural Co. (Centerville, Tenn.); and Virginia-Carolina Chemical Corp. (P. O. Box 1797, Richmond 14, Va.).

[1] Includes small quantity of Tennessee blue rock in 1945–47 and Virginia apatite in 1945–47 and 1949.

The Tennessee Valley Authority continued its mining and phosphate-processing activities in Tennessee and its technologic operations at its chemical plant at Muscle Shoals in 1949.

According to the annual report of the TVA for the fiscal year ended June 30, 1949, the TVA chemical plant at Muscle Shoals produced more than 158,700 tons of concentrated superphosphate, an increase of 4 percent from the previous fiscal year. More than 36,600 tons of dicalcium phosphate and 3,500 tons of calcium metaphosphate were also produced. Production of fused tricalcium phosphate in the plants at Columbia, Tenn., amounted to 15,200 tons.

During the year TVA began work on application to phosphate ores from Florida and the Western States of two methods of preparing materials for furnace charges developed with Tennessee phosphate sands and matrix. One method is pelletizing, in which the sands are tumbled in a kiln with clay or matrix to form pellets. A new large-scale pelletizing shaft-kiln plant was being designed to demonstrate the process. New large-scale briquetting equipment, which will press the material into lumps, was under construction.

TVA was also designing a large-scale rotating electric furnace, based upon data obtained in pilot-plant operations in the 1948 fiscal year, which indicated that the slowly rotating furnace could, to a considerable extent, use phosphate sands without pelletizing, briquetting, or other agglomeration; that it used less power than the conven-

tional furnace; and that more even distribution of heat reduced wear on the furnace lining.

A satisfactory catalyst and corrosion-resistant construction material for use in a previously known process for making phosphoric acid suitable for fertilizer manufacture by the catalytic oxidation of phosphorus with steam was found in small pilot-plant operations. This process also produces hydrogen as a byproduct; hence it is expected to have special value in areas, such as the western phosphate fields, where ammonia-synthesis facilities can be built in conjunction with electric furnace phosphorus production, particularly where natural gas is not available as a raw material for nitrogenous fertilizers.

TVA also practically completed a new calcium metaphosphate furnace unit in which unagglomerated fine phosphate may be used for a large part of the charge, thus reducing the cost and improving the chemical control of the product.

A plant-scale demonstration unit for recovering fluorine was placed in operation at the fused tricalcium phosphate plant toward the end of the year. The process, in which waste gases from the furnaces are passed through a tower packed with lump limestone, was tested in pilot-plant operation last year. The fluorine is recovered as calcium fluoride, which promises to be a salable byproduct in view of the expanded demand for fluorine compounds.

TVA also completed pilot-plant studies on defluorination of Florida and western-rock phosphate.

Pilot-plant studies during the year produced dicalcium nitraphosphate, containing typically 17 percent nitrogen and 23 percent P_2O_5. A similar project using sulfuric instead of phosphoric acid was tried in pilot-plant operations, producing material containing about 14 percent each of nitrogen and phosphate. A process in which rock-phosphate is treated with nitric acid and the product ammoniated was studied also.

A report dealing with the TVA's fertilizer production research, including laboratory investigations, pilot-plant operation, and full-scale demonstration-plant production, was issued during the year.[5]

The Victor Chemical Works, Chicago, Ill., continued production of elemental phosphorus at its electric furnace plant at Mount Pleasant, in the Tennessee brown-rock phosphate field. In 1949 this company acquired the A. R. Maas Chemical Co., South Gate, Calif., which was founded in 1919 by A. R. Maas to manufacture photographic chemicals, phosphoric acid, and sodium phosphates. The Victor Chemical Works also operates phosphorus furnaces at Victor, Fla., and processing plants at Chicago Heights, Ill., Nashville, Tenn., and Morrisville, Pa.

The International Minerals & Chemical Corp. installed new drying and grinding facilities at the Wales plant during the fiscal year ended June 30, 1949, with resultant improved efficiency and lowered costs. The acquisition of additional reserves has lengthened the life of the Wales mine and postponed the opening of a new Hickman County mine. The company output from its Tennessee mines was reported sold as raw material for electric furnace operations and as finely ground phosphate rock for direct application to the soil.

[5] Tennessee Valley Authority, Soil, People, and Fertilizer Technology: Washington, D. C., 1949, 57 pp.

Virginia.—No apatite was produced in 1949 by the Calco Chemical Division of the American Cyanamid Co. at its Piney River, Va., property. However, some shipments of apatite for export were made from stock. The apatite-recovery portion of the plant was not operated in 1948 or in 1949, and the shut-down of this unit is reported permanent by the company. Mining operations continued on the nelsonite (apatite-ilmenite) deposit. The annual output of the crude ore is reported as about 170,000 tons.[6]

WESTERN STATES

Total marketed production of Western States phosphate rock rose slightly in 1949, according to reports from producers to the Bureau of Mines. Increases in Montana counterbalanced declines in Idaho and Wyoming. (See fig. 2.) The total value fell, an increase of $854,076 in the value of the sales of Montana phosphate rock being insufficient to make up for declines in the value of the sales of the other States. Phosphate rock was produced in 1949 in all four States of the western field—Idaho, Montana, Utah, and Wyoming. There were no shipments, however, from Utah.

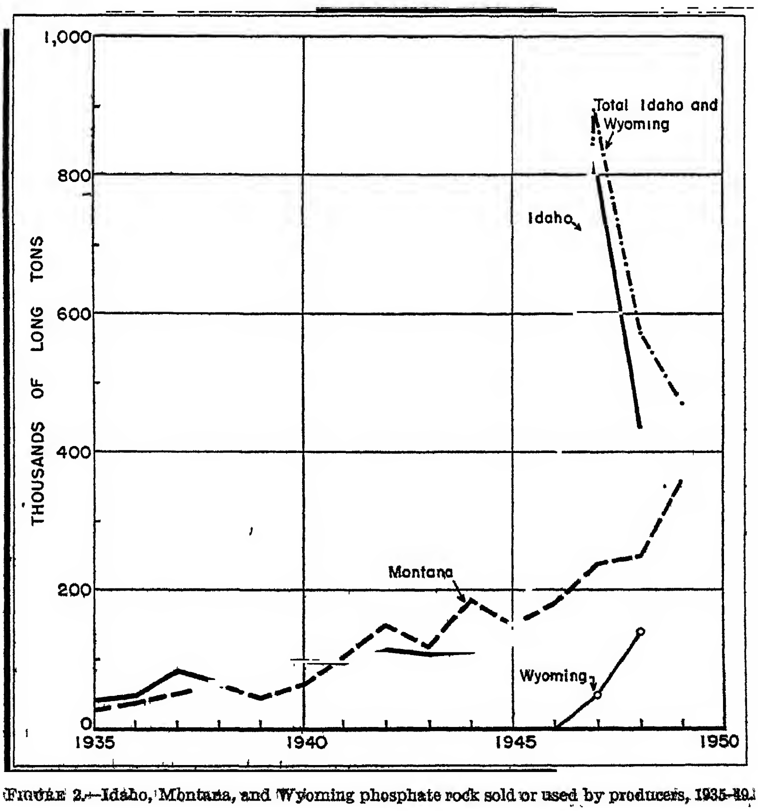

FIGURE 2.—Idaho, Montana, and Wyoming phosphate rock sold or used by producers, 1935–49.

[6] Engineering and Mining Journal, Piney River Operations: Vol. 150, No. 7, July 1949, p. 123.

New regulations doubling the maximum acreage of public lands that might be leased for exploration, development, and production of phosphate rock were announced by the United States Department of the Interior early in 1949. These new regulations authorize long-term leases which have no terminal date but can be revised at the end of 20 years. Two types of leases are provided—noncompetitive leases to promote the discovery of deposits of phosphate rock in unexplored areas and competitive leases for development of areas known to contain commercial phosphate deposits or in which there is competition. Minimum royalties are raised from 2 to 5 percent; rents and royalties are to be paid out of resulting production. The leases are subject to cancellation if phosphate rock is not discovered within 3 years or if production is not begun by the fourth year after issuance.

Several general articles on the phosphate-rock industry of the Western States appeared recently.[7]

Western States phosphate rock sold or used by producers, 1945–49

Idaho.—Idaho retained its position as the leading phosphate-rock producer of the Western States in 1949; but its output, both in quantity and value, suffered sharp drops from those of 1948. Shipments were greater than for any year except 1947 and 1948. Totals for the State, however, cannot be given without disclosing the production of individual companies. General descriptions of Idaho phosphate-rock deposits and mines are given in several papers published in 1949.[8]

Only two companies were reported producing in Idaho in 1949. The larger producer was again the Simplot Fertilizer Co., Pocatello, Idaho, which continued its open-pit mining operations on the Fort Hall Indian Reservation, Bingham County, about 16 miles east of Fort Hall. Here power shovels strip, mine, and load the phosphate rock into pit trucks for transportation to railhead for loading into cars to be taken to the superphosphate plant and electric furnaces near Pocatello. Caterpillar-powered scrapers and bulldozers assist in the stripping. Phosphatic shale beds containing 25 percent P_2O_5 overlie a 6-foot bed of high-grade phosphate rock. The phosphate shales are mined and shipped to the Westvaco electric elemental phosphorus furnaces near Pocatello, and the higher-grade phosphate rock is utilized for superphosphate at the Simplot plant near the same place. Stripping operations were started in June 1946, and about 53,000 tons of phosphate rock produced in that year. In 1947, because of United States Army requirements for export to Japan, nearly 500,000 tons of phosphate rock were produced. Production in later years has been much smaller. In 1949 the Simplot Fertilizer Co. completed crushing, screening, and sampling plants in the Fort Hall area. At Pocatello it finished an addition to its acidulation plant. Soil-building mixing plants were constructed at Greeley, Colo.; Klamath Falls, Idaho; and Idaho Falls, Idaho. Large quantities of phosphatic shales were shipped in 1949 to the Westvaco furnace at Pocatello for the production of elemental phosphorus; a considerable tonnage of the phosphate rock produced was used by the Simplot Co. for the production of superphosphate, and a large amount was exported.

Details of the operations of the Simplot Fertilizer Co. are given in several articles published in 1949.[9] The Simplot Fertilizer Co. is reported to have started production of ammonium phosphate and ammonium sulfate at the old Kalunite plant in Salt Lake City in the summer of 1949.

The Westvaco Chemical Division, Food Machinery & Chemical Corp., completed the construction of its first electric furnace at Pocatello, Idaho, in 1949 and began its operation in the summer of

that year. Construction of a second furnace was in progress during the later part of the year, with operation expected in 1950. Facilities for converting phosphorus from this second unit are being provided through expansion of the division's Carteret, N. J., phosphate plant, and through erection of a new phosphate plant on the Pacific coast at Newark, Calif. It will adjoin the magnesium oxide plant now operated at Newark by the Westvaco Chemical Division. Westvaco is to use the low-grade phosphatic shales from the Fort Hall deposits, and Simplot is to continue making fertilizer from the high-grade deposits. The first of the electric furnaces is said to have a phosphorus-producing capacity of 8,000 tons a year; the second furnace is expected to turn out 9,000 tons of elemental phosphorus a year. The company obtains its phosphate shale under a long-term contract with the J. R. Simplot Co. The reserves of the phosphate shale are stated to be sufficient to keep the two furnaces running at rated capacity for at least 25 years.

The Anaconda Copper Mining Co. operated its No. 3 mine at Conda, Caribou County, Idaho, processing the phosphate rock produced at the company's plant at Anaconda, Mont., largely to high-analysis superphosphate. A smaller quantity went into the manufacture for sale of phosphoric acid and phosphate chemicals. None was exported. The deposits and operations at the mine and plants have been described in recent articles.[10] The company completed a plant expansion program at Anaconda, Mont., in 1949.

The San Francisco Chemical Co., Montpelier, Idaho, reported that it did not operate its Waterloo mine on the slopes of Waterloo Hill, 5 miles east of Montpelier, in 1949. The open-pit operations on this property in 1947 were described in a recent article.[11]

The property of the Teton Phosphate Co., Inc., Montpelier, Idaho, was inactive during 1949. Development work is reported on a phosphate-rock property (McIllwee) near Paris, Idaho.

A treble-superphosphate plant, producing and using wet-process phosphoric acid for the production of treble superphosphate, was completed in 1949 at Wendell, southern Idaho. It was built by Gates Bros., Inc., in cooperation with the Idaho Farm Bureau Federation. The formal opening of this plant of the Gem State Phosphate Co. was held at Wendell, Idaho, August 5, 1949, and the plant is said to have started operation near the end of the year. A spur connects the plant with the Union Pacific Railroad. Phosphate rock for operation of the plant is to come from deposits reported leased by the Idaho Farm Bureau Federation, Gem State Phosphate Co., and Gates Bros., Inc., in the region of the Idaho-Wyoming-Utah boundary. The reported daily capacity of the plant is 100 short tons of treble superphosphate. The product, "Gem State phosphate," is to go to the members of the Idaho Farm Bureau Federation. These groups report that no phosphate rock was produced from their properties in 1949.

That used in the plant was said to have been purchased from other mining companies.

The Pacific Supply Cooperative has obtained a Government phosphate lease on 1,500 acres of the Dry Ridge deposit near Soda Springs, Idaho. Ten miles south of this deposit is the Georgetown Canyon phosphate-rock deposit, said to have been recently purchased by 15 midwestern cooperatives forming the Central Farmers Association of Chicago. Extensive core drilling has been under way at this location.

Montana.—Montana phosphate-rock production continues to increase; its rising output approached the declining output of Idaho in 1949. Shipments from Montana mines in 1949 totaled 355,169 long tons valued at $2,574,330. Both quantity and value exceeded those of 1948; both were new records. The Montana Phosphate Products Co., Trail, British Columbia, was the largest producer and shipper in the Western States. It operated its Anaconda, Anderson, and Graveley mines, as well as several Government leases, all in the Garrison district, Powell County. All of the rock shipped was exported to the plant of the parent company at Trail, British Columbia. Operations at the three underground mines of this company, all reported on the same phosphate-rock bed in the Phosphoria formation, were described in recent articles.[12]

Mining operations were also carried on by George Relyea at the Relyea mine, also in the Garrison district; and the production was also exported to Trail, British Columbia. Anderson Bros. Mining Co., Box 322, Butte, Mont., mined and shipped a small tonnage of phosphate rock in 1949 from another property in the Garrison district. The Silica Products Co., Inc., 433 Provident Building, Tacoma 2, Wash., which has under lease 1 mile along the outcrop of a phosphate-rock bed in sec. 29, T. 10 N., R. 6 W., in the Elliston phosphate field, Powell County, Mont., reports that it was not in production in 1949, and no phosphate rock was shipped.

In the Philipsburg district, Granite County, only Manganese Products, Inc., Seattle, Wash., and Soluble Phosphates, Ltd., Maxville, Mont., were in operation in 1949. The former operated the Edgar mine, near Hall, Granite County, and the Red Hill mine near Philipsburg and shipped phosphate rock to Seattle, Wash., for the production of a fused calcium-magnesium-phosphate fertilizer. This plant was described in recent articles.[13] A small tonnage was produced by Soluble Phosphates, Ltd., and sold for direct application to the soil. The Moonlight Mining Co. (Roy Atkinson), Ronan, Mont., reports that no phosphate rock was shipped from the Moonlight mine near Princeton in 1949 and that the company has passed into the hands of a receiver.

Utah.—Only a few hundred tons of phosphate rock are known to have been produced in Utah during 1949. This resulted from development work at the property of the F. J. Pearl Minerals Co. (153 North Willow Ave., Baldwin Park, Calif.), at the south end of the Crawford Mountains, in Rich County, in northeastern Utah, near Woodruff,

in the W½W½ sec. 36, T. 10 N., R. 7 E., S. L. B. M. This is on land leased in 1949 from the Utah State Land Board. Development work done consisted of a tunnel about 165 feet long driven in a steeply inclined phosphate-rock bed reportedly 4 to 5 feet thick, averaging 30 percent P_2O_5. No phosphate rock was shipped from this property during 1949.

The Garfield Chemical & Manufacturing Corp., Salt Lake City, Utah, has in the past produced a small amount of metallurgical phosphate rock yearly from a Federal lease in the Spanish Fort Canyon area in Utah County, near Springville, Utah. None was produced in 1949. The Utah Phosphate Co., Morgan, Utah, with a phosphate-rock mine and mill near Morgan, Morgan County, Utah, did not report any operations in 1949. No operations were reported on the phosphate-rock deposit in Old Laketown Canyon in northeastern Utah, although it had been stated that such were intended.

Wyoming.—The reported production and shipments of Wyoming phosphate rock in 1949 decreased greatly from the 1948 figures; but the State, in third place among the Western States group, remains an important producer. Only one company was producing in 1949—the San Francisco Chemical Co., operating the Leefe mine on land leased from the Stauffer Chemical Co., in the Beckwith Hills syncline, 3½ miles west of Sage, in Lincoln County, Wyo., a station on the main line of the Union Pacific Railroad in southwestern Wyoming. A railroad spur connects the mine with the main line at a point 1 mile west of Sage. A description of the phosphate rock deposit and the operations of the company was published in 1949.[14]

Development work only is reported at the mine of Phosphate Mines. Inc., Kemmerer, Wyo., 7 miles north of that place, but several hundred tons were sold from stock for use as a fertilizer in direct application to the soil.

Whereas the highest-grade phosphate-rock deposits of Wyoming are found in the western part of the State, the lower-grade beds along the northeastern flank of the Wind River Mountains near Lander in west central Wyoming, are considered very important because of their nearness to the railroads, to the growing midwestern phosphatic fertilizer market, and to adequate coal reserves and potential power. Field and laboratory research is being carried on jointly by Federal and State agencies. One report resulting from these investigations was published early in 1949.[15] There has been no commercial production from the phosphate beds of the Wind River Range.

The United States Department of the Interior announced on December 14, 1949, a phosphate lease sale for 10 units totaling more than 15,500 acres of phosphate-rock-bearing land in Fremont County, Wyo. The sale was to be held on February 8, 1950, in Washington, D. C. Approximately 154 acres lie within the Shoshone National Forest.

Two reports of investigations of the vanadium deposits in the phosphate rock bearing Phosphoria formation in the Sublette Ridge

[14] King, D. L., Surface Strip Phosphate Mining at Leefe, Wyo., and Montpelier, Idaho: Am. Inst. Min. and Met. Eng., Min. Trans., vol. 184, August 1949 pp. 284-287.

and Salt River Range of Lincoln County, Wyo., contain data of interest to the phosphate-rock industry.[16]

California.—California does not produce phosphate rock. Submarine phosphorite deposits, however, have been reported off the California coast.[17] Phosphate fertilizers are produced in the State from phosphate rock and phosphate chemicals from phosphoric acid shipped in from Eastern States. The Permanente Metals Co., Permanente, Calif., has been producing a fused calcium-magnesium-phosphate fertilizer from serpentine and Idaho phosphate rock.[18] Late in 1949 the name of the company was changed to the Kaiser Aluminum & Chemical Corp. The only phosphate chemical plant on the west coast has been that of the A. R. Maas Chemical Co. at South Gate, Calif., near Los Angeles, where elemental phosphorus was burned to phosphoric acid and phosphate chemicals. This plant, founded in 1919 by A. R. Maas, was acquired in 1949 by the Victor Chemical Works, Chicago, Ill. This company produces elemental phosphorus at Mount Pleasant, Tenn., and Victor, Fla., and now has processing plants at Chicago Heights, Ill., Nashville, Tenn., Morrisville, Pa., and South Gate, Calif.

FOREIGN TRADE[19]

Data on imports and exports of phosphate rock and other phosphatic materials are shown in the following tables.

Phosphate rock and phosphatic fertilizers imported for consumption in the United States, 1948–49

[U. S. Department of Commerce]

Fertilizer	1948		1949	
	Long tons	Value	Long tons	Value
Apatite			3,428	$43,002
Phosphates, crude, not elsewhere specified	48,104	$608,932	61,463	778,840
Superphosphates (acid phosphate):				
Normal (standard), not over 25 percent P_2O_5 content	2,702	73,808	1,273	35,620
Concentrated (treble), over 25 percent P_2O_5 content	527	25,287		
Total superphosphates	3,229	99,095	1,273	35,620
Ammonium phosphates, used as fertilizer	96,632	6,127,968	112,745	7,543,101
Bone dust, or animal carbon and bone ash, fit only for fertilizer	7,398	411,252	27,320	1,394,085
Guano	29	1,343		
Slag, basic, ground or unground	29	559	94	267
Precipitated bone, fertilizer grade	458	23,146	3,619	247,133

BASIC SLAG

Basic slag is only a limited source of agricultural phosphorus in the United States. Domestic production comes from a single company smelting a phosphatic iron ore of the Birmingham, Ala., district; no figures of production or sales have been released for publication by this company. Annual imports are negligible. In 1948 only 29 long tons were imported; in 1949, only 94 tons.

Platinum-Group Metals

By Hubert W. Davis and Charlotte R. Buck

GENERAL SUMMARY

THE DEMAND for platinum in 1949 continued a downward trend that had persisted for four consecutive years, and the retail price dropped from $96 an ounce to $72. Demand for palladium was also at a much lower level and the decline more pronounced than for platinum; however, the price remained static at $24 an ounce. Demand for iridium, osmium, and rhodium was likewise smaller, but that for ruthenium was slightly larger. The prices of ruthenium and iridium dropped $24 and $10 an ounce, respectively, but quotations on osmium and rhodium remained unchanged. Refining of palladium and osmium was greater in 1949 than in 1948, that of platinum, rhodium, and ruthenium was smaller, but that of iridium was virtually the same in both years. Imports of refined platinum, palladium, iridium, and osmium were smaller than in 1948, but those of rhodium and ruthenium were larger. Receipts of palladium from the U. S. S. R.—the chief source of the 1948 imports—were conspicuous by their absence in 1949. A noteworthy development in 1949 was perfection of a new refining method for producing high-octane gasoline from low-grade and natural gasoline with the aid of platinum catalysts.

Salient statistics of platinum-group metals in the United States, 1948–49, in troy ounces

	1948	1949		1948	1949
Production:			Stocks in hands of refiners, importers, and dealers, Dec. 31:

Total	366,848	288,623			

[1] Revised figure.

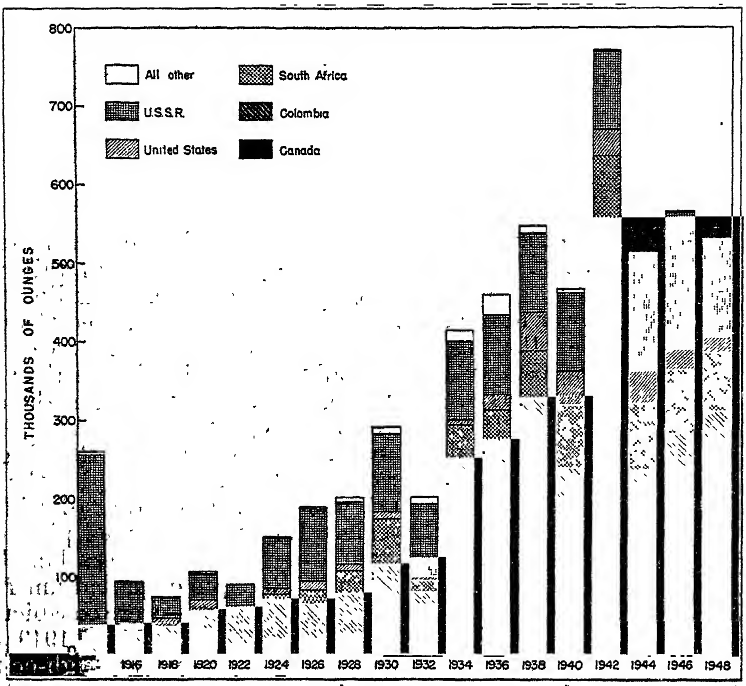

FIGURE 1.—Trend in world production of platinum-group metals, 1914–48.

Platinum was refined in the United States in 1949 at a rate 9 percent lower than in 1948 and 50 percent below the demand, which declined 13 percent. The refined-metal deficiency was met by imports of 95,070 ounces, chiefly from Canada (66,583 ounces) and United Kingdom (14,144 ounces). The jewelry trade was again by far the largest outlet for platinum, taking 53 percent of the total sold to domestic consumers. Sales to the jewelry industry were slightly less in 1949 than in 1948, and those to the dental trade were virtually unchanged, but those to the chemical and electrical industries were smaller by 23 and 32 percent, respectively.

Palladium was refined in the United States in 1949 at a rate 32 percent higher than in 1948. The quantity refined in 1949, however, was 68 percent less than sales, which were 26 percent smaller than in 1948. The deficit in palladium was partly met by imports of 73,770 ounces, chiefly from Canada (53,761 ounces), Switzerland (8,720 ounces), and United Kingdom (6,799 ounces) and partly by withdrawals from stocks of refiners and dealers. The much smaller sales of palladium to the chemical and electrical industries in 1949 were slightly offset by moderately greater sales to the dental and jewelry industries and for export.

More osmium but less rhodium and ruthenium were refined in the United States in 1949 than in 1948. Refining of iridium, however, was virtually the same in both years. More rhodium and ruthenium but less iridium and osmium were imported than in 1948. Sales to

domestic consuming industries of iridium, osmium, and rhodium were smaller by 7, 50, and 3 percent, respectively, than in 1948, but those of ruthenium were up 4 percent; sales of osmium and ruthenium for export were substantially greater, but those of iridium and rhodium were much smaller than in 1948.

Imports of platinum-group metals into the United States in 1949 were 20 percent less than in 1948.

Figure 1 shows graphically the trend in world production of platinum-group metals since 1914.

CRUDE PLATINUM PRODUCTION

Crude platinum-group metals were produced in Alaska and California in 1949 and totaled 17,169 ounces, compared with 13,741 ounces in 1948. The Alaskan production came from placer deposits in the Goodnews Bay district of southwestern Alaska, and the California output was a byproduct of gold placers in Butte, Merced, Sacramento, Siskiyou, Stanislaus, and Yuba Counties.

Many gold and copper ores in the United States contain small quantities of platinum-group metals. In 1949, 7,638 ounces of platinum-group metals were recovered as byproducts of refining gold and copper ores compared with 5,512 ounces in 1948.

Source of Purchases.—Purchases of domestic crude platinum-group metals by buyers in the United States were reported from Alaska and California in 1949 and totaled 17,063 ounces (13,871 ounces in 1948). Domestic buyers also reported purchases of 30,612 ounces of foreign crude platinum-group metals from Colombia, 2,106 ounces from Union of South Africa, 299 ounces from Ethiopia, 102 ounces from Canada, and 51 ounces from Panama in 1949—a total of 33,170 ounces (23,245 ounces in 1948).

RECOVERY OF REFINED PLATINUM-GROUP METALS

New Metals Recovered.—Reports from refiners of crude platinum-group metals, gold bullion, and copper indicate that 51,926 ounces of platinum-group metals were recovered in the United States from such sources in 1949—an increase of 31 percent over 1948. Of the new metals recovered in 1949, 58 percent was chiefly from crude from Colombia, 27 percent was from domestic crude (largely Alaska), and 15 percent was a byproduct of domestic gold and copper ores.

Secondary Metals Recovered.—In 1949, 83,447 ounces of secondary platinum-group metals were recovered from the refining of scrap metal, sweeps, and other waste products of manufacture that contain platinum-group metals—an 11-percent decrease from 1948.

Substantial quantities of worn-out catalysts, spinnerets, laboratory ware and other products are returned by consumers to refiners for refining. The refined platinum-group metals recovered from these products (or their equivalent in refined metals) are returned to the consumers. The platinum-group metals so recovered are not included in the statistics of secondary metals.

New platinum-group metals recovered by refiners in the United States, 1941–1944 (average) and 1945–47, and 1948–49 by sources, in troy ounces

	Platinum	Palladium	Iridium	Osmium	Rhodium	Ruthenium	Total

1947	54,190	27,492	2,089	3,317	87,088
1948	58,527	28,418	2,214	4,742	93,901
1949	41,734	37,209	1,101	3,403	83,447

CONSUMPTION

As pure metals, combined, clad, or alloyed with other metals, the platinum-group metals are utilized in the electrical and chemical industries, in dentistry and jewelry, and for numerous miscellaneous purposes. Uses of the platinum-group metals are tabulated in Minerals Yearbook, 1943 (p. 801).

Sales of platinum-group metals to consumers in the United States were 288,623 ounces in 1949 compared with 366,848 ounces in 1948. Sales for export, as reported to the Bureau of Mines, were 36,143 ounces in 1949 compared with 33,513 ounces in 1948.

Platinum continued to be the most widely used metal of the group, and in 1949 total sales were 23 percent greater than those of palladium. Sales of platinum constituted 152,658 ounces (53 percent) of the total platinum-group metals sold to domestic consumers in 1949. The jewelry trade was again the chief buyer of platinum, taking 53 percent of the total sold to domestic consumers, but its purchases (80,426 ounces) were 2 percent less in 1949 than in 1948. Sales of platinum

to the electrical industry declined 32 percent to 28,699 ounces, and as a consequence it dropped to third place in 1949. The chemical industry, which purchased 32,179 ounces in 1949, ascended to second place as a buyer of platinum, although its purchases were down 23 percent. A noteworthy development in 1949 was perfection of a new refining method for producing high-octane gasoline from lower-grade and natural gasoline with the aid of platinum catalysts. Sales of platinum to the dental trade were virtually the same in 1949 as in 1948, but sales for export (14,456 ounces) were 4 percent smaller.

Next to platinum, palladium is the metal of the group used most extensively; it comprised 116,235 ounces (40 percent) of the total platinum-group metals sold to domestic consumers in 1949. The electrical industry retained first place as a buyer of palladium in 1949 by taking 54,275 ounces (47 percent) of the total palladium sold to domestic consumers, even though sales to the electrical industry were 48 percent less than in 1948—the all-time high. Less palladium was also sold to the chemical industry, but sales to the dental industry and for export (19,712 ounces) were greater. Palladium catalysts are playing an important role in the manufacture of the newer antibiotics, developed after penicillin. Sales to the jewelry trade were virtually the same in 1949 as in 1948.

Sales of the other platinum-group metals—iridium, osmium, rhodium, and ruthenium—were comparatively small; they made up only 7 percent of the total platinum-group metals sold in 1949. Domestic demand for iridium, osmium, and rhodium was 7, 50, and 3 percent, respectively, less than in 1948, but that for ruthenium 4 percent more. Exports of iridium, osmium, rhodium, and ruthenium, as reported to the Bureau of Mines, were 1,975 ounces in 1949 compared with 2,716 ounces in 1948.

The accompanying table shows sales of platinum-group metals to consuming industries in the United States in 1948 and 1949.

Platinum-group metals sold to consuming industries in the United States in 1948 and 1949, in troy ounces

Industry	Platinum	Palladium	Iridium, osmium, rhodium, and ruthenium	Total
1948				
Chemical	41,778	13,816	5,722	61,316
Electrical	42,306	105,033	2,784	150,123
Dental and medical	9,494	16,740	171	26,405
Jewelry and decorative	81,756	31,783	10,589	124,128
Miscellaneous and undistributed	2,107	238	2,531	4,876
Total	177,441	167,610	21,797	366,848
1949				
Chemical	32,179	9,580	4,454	46,213
Electrical	28,699	54,275	2,124	85,098
Dental and medical	9,505	19,901	121	29,527
Jewelry and decorative	80,426	32,060	10,792	123,278
Miscellaneous and undistributed	1,849	419	2,239	4,507
Total	152,658	116,235	19,730	288,623

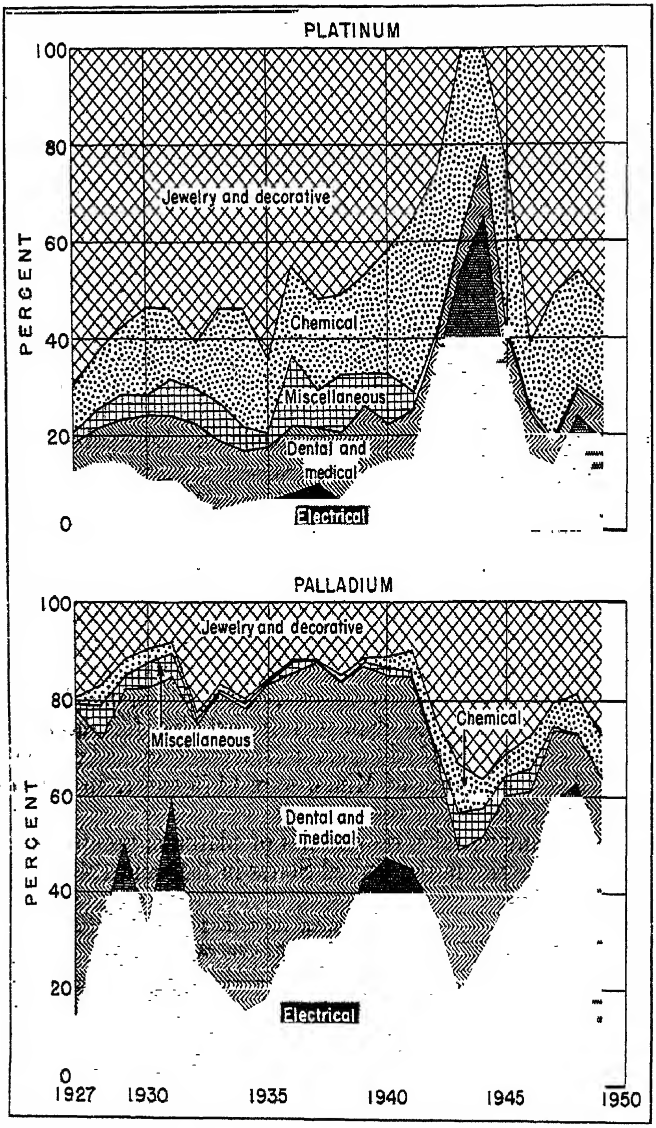

FIGURE 2.—Trend in sales of platinum and palladium to consuming industries in the United States, 1927–49, in percent.

STOCKS

Stocks of platinum-group metals in all forms in the hands of refiners, importers, and dealers totaled 296,044 ounces on December 31, 1949, compared with 323,574 ounces at the close of 1948.

Stocks of platinum-group metals held by refiners, importers, and dealers in the United States, Dec. 31, 1945–49, in troy ounces

Year	Platinum	Palladium	Iridium, osmium, rhodium, and ruthenium	Total
1945	138,839	119,757	43,376	301,972
1946	187,624	132,523	41,876	362,023
1947	133,300	167,364	36,859	337,523
1948	146,823	142,211	34,540	323,574
1949	138,049	122,408	35,587	296,044

PRICES

Buyers reported purchases at $55 to $87.25 an ounce for domestic and foreign crude platinum-group metals in 1949. This price range results chiefly from variations in iridium content of crudes and from market fluctuations for refined platinum and ruthenium in 1949.

As a result of five reductions after January 1, 1949, totaling $21, the retail prices of platinum and ruthenium reached $75 an ounce on March 17. On June 13 the quotations were reduced to $72, where they continued throughout the remainder of 1949. Iridium was quoted at $110–$115 an ounce on January 1, 1949; subsequently, three reductions were made, and on June 13 the price was $100–$105 an ounce, at which it continued throughout the remainder of 1949. Quotations on palladium, osmium, and rhodium continued unchanged at $24, $100, and $125 an ounce, respectively, throughout 1949.

FOREIGN TRADE [1]

Imports.—Imports of platinum-group metals into the United States in 1949 were 20 percent less than in 1948 and the smallest since 1940. The principal sources of imported platinum-group metals in 1949 were Canada (130,403 ounces), Colombia (26,335 ounces), United Kingdom (24,782 ounces), and Switzerland (15,148 ounces). Imports of refined metals (184,536 ounces), which comprised 85 percent of the total, were 23 percent less than in 1948, whereas those of unrefined materials (33,748 ounces) were virtually the same as in 1948. Imports of refined platinum, palladium, iridium, and osmium were 8, 39, 23, and 84 percent, respectively, less than in 1948, but imports of rhodium and ruthenium were up 30 and 33 percent, respectively.

Platinum-group metals imported for consumption in the United States, 1940–44 (average) and 1945–49

Year	Troy ounces	Value	Year	Troy ounces	Value
1940–44 (average)	307,821	$9,161,946	1947	308,865	$11,792,076
1945	383,658	11,591,390	1948	[1] 272,733	[1] 14,973,356
1946	407,210	14,696,320	1949	218,284	11,900,078

[3] Revised figure.

Exports.—Exports of refined platinum (including scrap) increased to 18,150 ounces in 1949 (15,471 ounces in 1948), and exports of the other platinum-group metals (including scrap) increased to 22,628 ounces (20,994 ounces in 1948). In 1949 the chief foreign markets for platinum were France (6,843 ounces), Germany (6,260 ounces), Canada (983 ounces), and Cuba (904 ounces) and for the other platinum-group metals, Germany (20,136 ounces).

WORLD REVIEW

Canada.—According to the Dominion Bureau of Statistics, production of platinum-group metals from the nickel-copper ores of the Sudbury district, plus a small quantity from placers in British Columbia, was 151,317 ounces of platinum and 192,106 ounces of other platinum-group metals in 1949 compared with 121,404 ounces of platinum and 148,343 ounces of other platinum-group metals in 1948.

Sales of platinum-group metals by the International Nickel Co. of Canada, Ltd., were 214,735 ounces in 1949 compared with 199,560 ounces in 1948.

Colombia.—The South American Gold & Platinum Co. produced 20,213 ounces of crude platinum-group metals in 1949 (22,779 ounces in 1948). The crude material contains about 85 percent platinum-group metals.

World production of platinum-group metals, 1940–44 (average) and 1945–49, in troy ounces

[1] Data not available.
[2] Includes certain adjustments to account for metals produced in Canada in 1938–44 but not previously accounted for in the statistics.
[3] Exports for year ended Sept. 10 of year stated.
[4] Year ended June 30 of year stated.

Union of South Africa.—According to the Department of Mines, 1,329 tons of concentrates averaging about 42.75 ounces per ton of platinum-group metals and 120,020 ounces of crude metallics averaging 25.39 percent of platinum-group metals were produced in South Africa in 1949, compared with 1,084 tons of concentrates and 83,856 ounces of crude metallics in 1948. Thus, total output of platinum-group metals was about 87,300 ounces in 1949 compared with 68,926 ounces in 1948. The platinum-group metals are produced in the Rustenburg district and exported to England for refining.

Sales of platinum-group metals and gold from the Rustenburg district were 94,092 ounces in 1949 compared with 64,579 ounces in 1948. The proportions of the various metals of the platinum group and gold sold in 1948 were as follows:

Metal:	*Percent*	*Ounces*
Platinum	69.17	44,670
Palladium	22.03	14,230
Iridium	.47	303
Osmium and osmiridium	.09	60
Rhodium	2.57	1,658
Ruthenium	1.29	831
Gold	4.38	2,827
	100.00	64,579

South Africa is the largest producer of osmiridium in the world. It is recovered in treating gold ores on the Rand. Production was 6,031 ounces in 1949 (5,520 ounces in 1948). Sales were 6,471 ounces in 1949 (5,774 ounces in 1948). The osmiridium sold in 1948 averaged 29.08 percent osmium; 25.68 percent iridium; 12.41 percent ruthenium; 11.62 percent platinum; 0.64 percent rhodium; 2.54 percent gold; and 18.03 percent undetermined.

The work of expanding the plant of Rustenburg Platinum Mines, Ltd., continued in 1949, and certain additional units in the crushing, milling, and flotation sections were brought into operation; consequently, the tonnage of ore crushed was materially increased. Rustenburg Platinum Mines, Ltd., acquired the Union Platinum Mining Co., Ltd., on August 31, 1949. To refine the combined outputs of both mines, arrangements were made with Johnson, Matthey & Co. to expand its refinery in London.

Potash

By Bertrand L. Johnson and E. M. Tucker

GENERAL SUMMARY

A STRIKE in the potash mines of the Carlsbad district of New Mexico in November and December 1949 caused a slight reversal in the long upward trend of production and sales of potash in the United States. According to reports by producers, the output of marketable potassium salts dropped to 2,056,609 short tons, a decrease of 81,884 tons from the 1948 peak of 2,138,493 tons. (See fig. 1.) The equivalent K_2O content decreased 21,486 tons from that of the previous year. Sales likewise declined, but remained above 2,000,000 tons (2,062,789 tons), with the K_2O content (1,120,653 tons) 22,686 tons lower. Sales decreased nearly $900,000 in total value from those of 1948, but the average value per ton of the potassium salts sold in 1949 was $0.27 more than in 1948. Stocks in producers' hands at the end of 1949 reached a new low of 9,066 tons. Both imports and exports declined in quantity and value in 1949 from 1948. Apparent domestic consumption of potash (K_2O) in 1949 fell 30,475 tons from the 1948 figure.

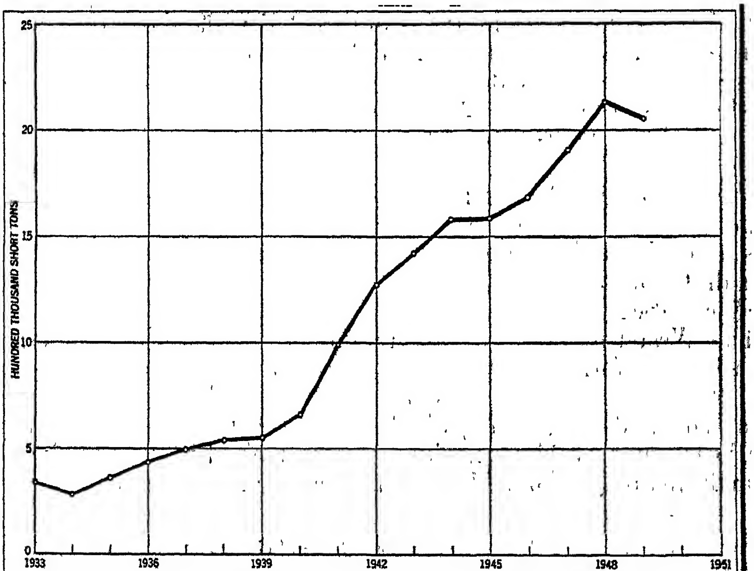

FIGURE 1.—Production of marketable potash salts in the United States, 1933–49.

Salient statistics of the potash industry in the United States, 1947–49

	1947	1948	1949
Production of potassium salts (marketable) short tons	1,905,776	2,138,493	2,056,609
Approximate equivalent K_2O do	1,029,875	1,139,881	1,118,395
Sales of potassium salts by producers do	1,953,307	2,148,807	2,062,789
Approximate equivalent K_2O do	1,053,266	1,143,339	1,120,653
Value at plant	$34,716,051	$35,998,758	$35,105,799
Average per ton	$17.77	$16.75	$17.02
Imports of potash materials short tons	51,043	52,890	43,719
Approximate equivalent K_2O do	25,978	27,181	19,216
Value	$2,475,351	[1] $3,063,547	$2,358,557
Exports of potash materials short tons	124,909	128,068	126,754
Approximate equivalent K_2O [2] do	68,102	69,733	69,557
Value	$8,686,107	$8,288,955	$7,110,054
Apparent consumption of potassium salts [3] short tons	1,879,441	2,073,629	1,979,754
Approximate equivalent K_2O do	1,011,142	1,100,787	1,070,312

[1] Revised figure.
[2] Estimate by Bureau of Mines.
[3] Quantity sold by producers, plus imports, minus exports.

Several articles on the potash industry were published in 1949.[1] A study of the domestic potash industry was included in a report on the fertilizer industry, released shortly after the end of the year by the Federal Trade Commission.[2]

PRODUCTION AND SALES

A strike in the New Mexico potash field in 1949 stopped the upward trends in the production and sales of domestic marketable potassium salts that had featured the years since 1934, and production and sales each decreased 4 percent from the 1948 figures. The output of potassium salts in 1949 totaled 2,056,609 short tons with an equivalent K_2O content of 1,118,395 tons. Sales were 2,062,789 tons, with an equivalent K_2O content of 1,120,653 tons. The value of the sales dropped $892,959 to $35,105,799. The average value per ton of the potassium salts sold in 1949 was $17.02, $0.27 more than 1948.

Production of 60–62-percent-K_2O minimum grade of the muriate of potash and of manure salts was less in 1949 than in 1948, but there was a considerable increase in the lower-grade muriate. Production of sulfate of potash and sulfate of potash-magnesia continued to decline. (See fig. 2.)

The Western States remain dominant in domestic production of potash. California, New Mexico, and Utah furnished virtually all of the 1949 output, the largest part coming from deeply buried deposits of sylvite and langbeinite, of Permian age, in the Carlsbad region, southeastern New Mexico. The eastern United States supplied only a small quantity—from Maryland, Michigan, and Pennsylvania.

The potash-producing companies in the United States in 1949, by States, were as follows:

California:
The American Potash & Chemical Corp., 3030 West Sixth Street, Los Angeles 54, Calif. (plant at Trona, on Searles Lake, Calif.).

Maryland:
North American Cement Corp., 41 East Forty-Second Street, New York, N. Y. (plant at Security, Md.).

Michigan:
The Dow Chemical Co., Midland, Mich. (brine wells and plant near Midland, Mich.).

New Mexico:
International Minerals & Chemical Corp., 20 North Wacker Drive, Chicago, Ill. (mine and plant near Carlsbad, N. Mex.).
Potash Company of America, Carlsbad, N. Mex. (mine and plant near Carlsbad, N. Mex.).
United States Potash Co., Inc., 30 Rockefeller Plaza, New York, N. Y. (mine and plant near Carlsbad, N. Mex.).

Pennsylvania:
Publicker Industries, Inc., 1429 Walnut Street, Philadelphia 2, Pa.

Utah:
Bonneville, Ltd., 540 West Seventh South, Salt Lake City 4, Utah (plant near Wendover, Utah).

REVIEW BY STATES

California.—The American Potash & Chemical Corp. continues to be the only potash-producing company operating in the Pacific Coast States. A potash-bearing brine was pumped from the saturated crystalline salt mass of Searles Lake in southeastern California. Potassium chloride and potassium sulfate are marketed. Deep-drilling operations are reported to have increased the known reserves of potash at this property.[3]

Maryland.—Maryland has but one producing potash company, the North American Cement Corp., which at its plant at Security, Washington County, near Hagerstown, recovers byproduct potash from cement-kiln flue dust. The product—an impure sulfate of potash of low potash content—was sold for agricultural use. This operation was the only one of its kind reported in the United States in 1949.

Michigan.—The Dow Chemical Co. was the only potash-producing company in Michigan in 1949. Potassium chloride was produced from its natural brine wells at Midland, Mich.

New Mexico.—Mine production of potassium salts in the Carlsbad region of New Mexico declined 5 percent in 1949 from 1948, as a result of a year-end strike. The three companies operating in this area in 1949 mined 4,852,903 short tons of sylvinite and langbeinite combined—a decrease of 255,469 tons from 1948. The equivalent K_2O content of the mined production in 1949 was 1,018,886 short tons. The average equivalent K_2O content of the mined salts increased from 20.94 percent in 1948 to 21.00 percent in 1949.

All three of the producing companies—International Minerals & Chemical Corp., Potash Company of America, and the United States Potash Co.—mined sylvite (potassium chloride) and one—International Minerals & Chemical Corp.—also mined langbeinite (a potassium-magnesium sulfate). The greater part of the mine production of the region was sylvite, most of which was processed to yield 60-percent or higher-grade muriate. The production of merchantable potash salts in New Mexico in 1949 was 1,733,739 short tons, with an equivalent K_2O content of 927,621 tons. Sales were 1,744,427 tons of salts (932,497 tons K_2O) valued at $27,950,111. Muriate of potash was produced by all three companies. Potassium sulfate and potassium-magnesium sulfate (sulfate of potash-magnesia) were pro-

[3] Taylor, Frank J., The World's Richest Mineral Stock Pile: Saturday Evening Post, Mar. 5, 1949, pp. 26–27, 68, 70, 72.

duced from langbeinite by the International Minerals & Chemical Corp. in the refinery at its mine near Carlsbad.

The strike previously referred to was called on November 19, 1949, by C. I. O. Mine, Mill, and Smelter Workers' Union Local 415 at the three potash-producing plants of the Carlsbad region, and output and shipments stopped. The strike continued until January 31, 1950, but some potash was produced and shipped during the latter part of January.[4] A little is said to have been moved from one of the refineries in December.

Several papers regarding developments in the potash industry of New Mexico in 1949 have appeared recently.[5]

The International Minerals & Chemical Corp. completed an extensive development program which included a new refinery for the production of chemical-grade potassium chloride and a higher-grade potassium sulfate. The capacity of this plant at full production is expected to be over 22,000 tons KCl annually and 60,000 tons K_2SO_4 per year. The equipment installed includes agitators, Ozark evaporators, heaters, vacuum crystallizers, Bird centrifuges, and a rotary drier. Plant feed is 60-percent-grade sylvite concentrate. The mother liquor goes to the base-exchange plant, where potassium sulfate is produced by base exchange of sylvite and langbeinite. Other improvements at the surface include the replacement of vacuum filters handling flotation concentrates by Bird continuous centrifuges that deliver a lower-moisture feed to gas-fired rotary driers. International is now installing a 400-kv.-a. automatic starting and running Diesel generator set for use in case of power supply failure. The company's present main Diesel plant is to be shut down, and all power in future is to be supplied by the Southwestern Public Service Co. Underground, some Diesel equipment such as bulldozers is in use. The company is testing the effect of pillar robbing in a mined-out panel on the 900-foot level.

During 1949 the Potash Company of America completed the expansion and improvement program begun early in 1948 for the production of potassium chloride. Improvements are stated to include a 26-mile pipe line for fresh-water supply, the addition of two large grinding mills, a Symons cone crusher, six cooling agitator plants, a 24-cell flotation section, a 1,000-hp. hoist, and all-steel dump cars. Construction is expected to be started in 1950 on a plant for the production of potassium sulfate and hydrochloric acid. The No. 4 shaft is reported to have been practically completed in December 1949.

The productive capacity of the United States Potash Co. plant is reported to be considerably increased by the expansion program currently being carried out. A crystal refining unit has been added to its Loving, N. Mex., plant.

The Central Farmers' Fertilizer Co., a cooperative, did considerable drilling in the southern part of the Carlsbad potash field.

The Duval Texas Sulphur Co., a subsidiary of the United Gas Corp., drilled extensively in the southern and northern parts of this field. Potassium sulfate ores were found in the southern area. Workable sylvite deposits were outlined by the drilling on Government land in the northern part of the area between the mines of the Potash Company of America and the United States Potash Co. Plans have been made to lease the ground and mine the potash salts.

The Freeport Sulphur Co. is said to have acquired control of the Cross interests, leases, and permits. The latter have been conducting solution-type mining tests but have discontinued work with no commercial results reported.

The Southwest Potash Co., a wholly owned subsidiary of the American Metal Co., Ltd., is core-drilling leased holdings in the Carlsbad potash area, approximately six miles north of the operations of the Potash Company of America. An area of good-grade sylvinite is reported to have been outlined.

Pennsylvania.—The Publicker Industries, Inc., reports the recovery in 1949 of a low-potash-content potassium sulfate from molasses residues at their Bigler Street distillery in Philadelphia. This by-product potash material was sold for use as a fertilizer ingredient.

Utah.—Commercial production of potash in Utah in 1949 was restricted to the operations of Bonneville, Ltd., which continued to produce potassium chloride from the potassium-bearing brines of Salduro Marsh, at its plant near Wendover, Tooele County, northwestern Utah.

There was no development work in progress in 1949 in the potash-bearing area in Grand County in eastern Utah. Prospecting for potash in this region continued in connection with oil-well drilling. Two wells—one of the Tidewater Associated Oil Co., 8,300 feet deep, near Moab, and the other of the Pacific Western Oil Co., 13,766 feet deep, drilled about 6 miles east of the Thompson well—were partly cored and the cores tested for potassium.

A report [6] of drilling, by the Bureau of Mines and Geological Survey, of the Defense Plant Corporation, Utah Magnesium Corp., Reeder No. 1 well, near Thompson, Utah, in 1942, was published in 1949. A detailed log of the well is given and also a table showing chemical and mineralogical analyses of numerous core samples.

There was no production of alunite in the Marysvale district.

CONSUMPTION

Apparent consumption of potash (K_2O) in the United States and its possessions decreased from 1,100,787 short tons in 1948 to 1,070,312 tons in 1949, as determined by subtracting exports from the sum of the imports and the producers' sales. The relationship of the apparent

[6] Severy, C. L., Kline, M. H., and Allsman, P. T., Investigations of the Thompson Magnesium Well, Grand County, Utah: Bureau of Mines, Rept. of Investigations 4496, 1949, 21 pp.

consumption to the sales of domestic producers, as reported to the Bureau of Mines, for a period of years is shown in figure 3.

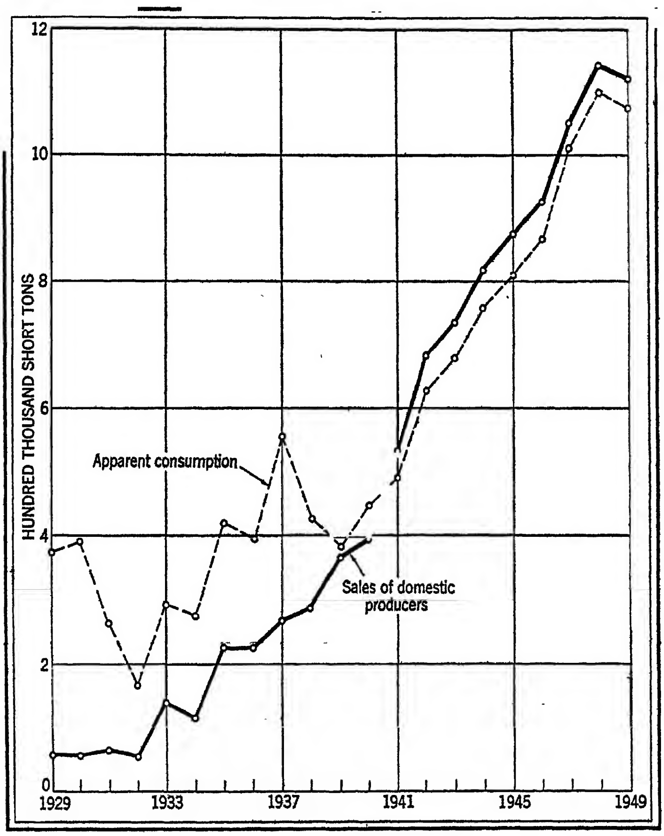

FIGURE 3.—Comparison of apparent domestic consumption of potash (K_2O) and sales by domestic producers of potash in the United States, 1929–49.

Apparent consumption[1] of potash in the United States, 1945–49. in short tons

Year	Potassium salts	Approximate equivalent K_2O	Year	Potassium salts	Approximate equivalent K_2O
1945	1,490,112	808,688	1948	2,073,629	1,100,787
1946	1,568,721	867,096	1949	1,979,754	1,070,812
1947	1,879,441	1,011,142			

[1] Quantity sold by producers, plus imports, minus exports.

According to the American Potash Institute (press notice February 1, 1950):

Deliveries of potash in North America during 1949 by the five leading producers and two importers amounted to 2,104,820 [short] tons of potash salts containing an equivalent of 1,145,793 tons K_2O. This was a decrease of 28,049 tons K_2O or 2.4 percent under 1948, due to a strike of potash miners in the Carlsbad area

beginning November 19, 1949, and continuing past the end of the year. Prior to that date, deliveries in 1949 had been running well ahead of last year. Included in the above figures are 65,912 tons of salts of French origin with an equivalent of 40,126 tons K_2O. There were no importations of German potash during the calendar year.

Deliveries for agricultural purposes in the continental United States for 1949 were 972,154 tons K_2O, a decrease of 5,227 tons under 1948. Canada received 65,028 tons K_2O, Cuba 5,151 tons, Puerto Rico 14,320 tons, and Hawaii 11,535 tons. Exports to other countries amounted to 11,040 tons K_2O.

In this country the potash was delivered in 45 States and the District of Columbia. Ohio with over 90,000 tons K_2O was the leading State in deliveries of agricultural potash and was followed in order by Georgia, Illinois, North Carolina, Virginia, and Florida, each taking more than 60,000 tons K_2O during the year. Due to shipments across State lines, consumption does not necessarily correspond to deliveries within a State.

The 60 percent muriate of potash continues to be by far the most popular material, comprising 81 percent of the total K_2O delivered for agricultural purposes. The 50 percent muriate of potash made up 8 percent, manure salts 4 percent, and sulphate of potash and sulphate of potash-magnesia 7 percent of the deliveries. With increased refining capacity brought into production during the year, a greater proportion of the deliveries was in the form of the more concentrated forms, with a falling off in manure salts.

Deliveries [in North America] for chemical purposes in 1949 were 101,283 tons of muriate of potash containing an equivalent of 63,409 tons K_2O, and 6,230 tons of sulphate of potash containing 3,156 tons K_2O. The total chemical deliveries of 66,565 tons K_2O were 21,461 tons or 24 percent less than in 1948.

Deliveries of agricultural and chemical potash in North America from 1939 to 1949 are shown in the accompanying diagram (fig. 4).

Deliveries of potash salts in 1949, by States of destination, in short tons of K_2O

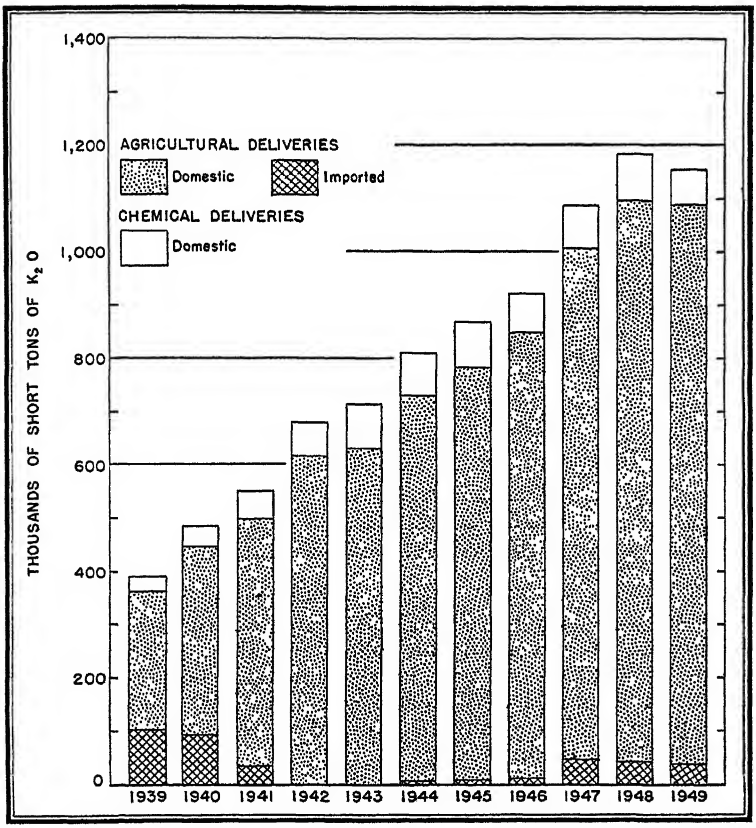

FIGURE 4.—Potash deliveries, by use groups, in North America, 1939-49 (American Potash Institute).

STOCKS

Continuing demand for potash in 1949 and interruption of mining operations toward the end of the year resulted in a decline of producers' stocks to the lowest point since 1942. The trend is presented graphically in figure 5, and precise data for 1945–49 are included in the third table of this chapter.

PRICES

Prices for potash in the early part of 1949 were those listed in the producers' price schedules for the 1948–49 season. (See Minerals Yearbook, 1948, p. 1062.)

On May 6, 1949, the American Potash & Chemical Corp. issued its price schedule for Trona potash for the 1949–50 season. Its list price of muriate of potash, 60 percent K_2O minimum, f. o. b. Trona, Calif., bulk, in carlots of not less than 40 tons, was retained at 45.5 cents per unit K_2O, with an additional charge for shipments in bags. The seasonal discounts were the same as for 1948–49. The list price of sulfate was continued at 79 cents per unit K_2O.

943785—51——66

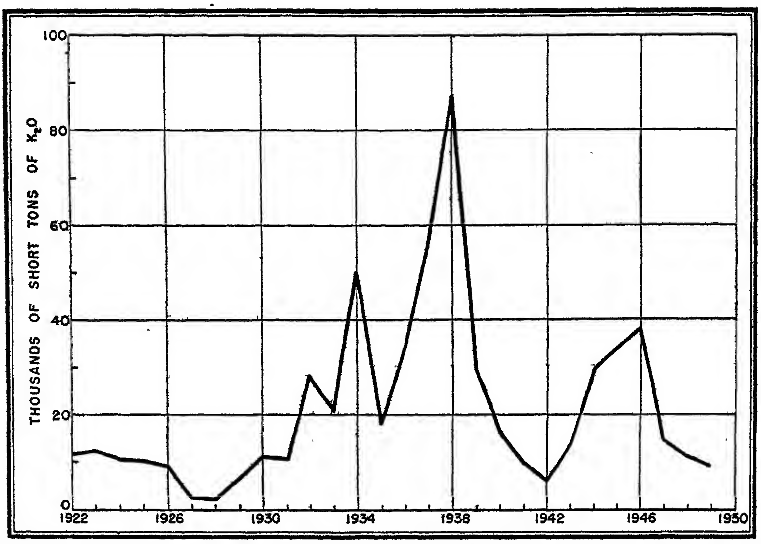

FIGURE 5.—Equivalent potash (K_2O), content in producers' stocks at end of year, 1922–49, in short tons.

Price schedules for New Mexico potash for agricultural purposes for 1949–50 were issued in April and May 1949 by the three producing companies, as given in the following table. The only change from the 1948–49 prices was in the muriate, 60-percent granular grade, which is priced at 39 cents per unit K_2O compared with a previous price of 37.5 cents; the upward revision was made to cover the increased cost of processing.

Prices of agricultural potash quoted by producers, f. o. b. Carlsbad, N. Mex., for 1949–50 season [1]

Salt	Grade	Brand	Producer	Price
Muriate of potash	62–63 percent K_2O	Sunshine State	U. S. P	37.5 cents per unit K_2O.
Do	60 percent K_2O minimum, standard.	Red Muriate	P. C. A	Do.
Do	60 percent K_2O minimum	International	I. M. & C	Do.
Do	60 percent K_2O minimum, granular.	Red Muriate	P. C. A	39 cents per unit K_2O.
Do	48–50 percent K_2O, granular.	Sunshine State	U. S. P	37.5 cents per unit K_2O.
Do.[2]	50 percent K_2O minimum	International	I. M. & C	Do.
Manure salts	22 percent K_2O minimum	Red Muriate	P. C. A	20 cents per unit K_2O.
Do	Run-of-mine 20 percent K_2O minimum.	Sunshine State	U. S. P	Do.
Sulfate of potash	90–95 percent K_2SO_4, basis 90 percent K_2SO_4.	International	I. M. & C	$32.50 per short ton.
Sulfate of potash-magnesia.	Basis 40 percent K_2SO_4, 18.50 percent MgO.	International Sul-po-mag.	do	$14.50 per short ton.

[1] Bulk in carlets (minimum 40 tons). Subject to seasonal discounts.
[2] International Minerals & Chemical Corp. quoted muriate of potash, 50–51 percent K_2O, packed in 5-ply plain paper bags, 100 pounds each, at $23 per short ton.

At the end of 1949 interest increased in cottonseed-hull ash, and sales were reported at $1.75 per unit of potash in bags, carlots, delivered. Ground cottonbur ash, a source of carbonate of potash, was offered in December 1949 at around 75 cents per unit of potash (K_2O) in bulk, f. o. b. cars, Texas shipping point.

Sales of imported French muriate of potash were reported in trade journals during 1949 at 65 cents per unit K_2O, ex vessel Atlantic ports for November–April shipments. Some muriate of potash and sulfate of potash from the American zone in Germany is said to have been offered for shipment, the muriate at 80 cents per unit and the sulfate at $48 per ton ex vessel, Atlantic or Gulf ports.

FOREIGN TRADE [7]

Imports.—Total imports of potash salts in 1949 were considerably smaller than in 1948, dropping to only 43,719 short tons (19,216 tons K_2O) owing to decreased arrivals of potassium-bearing fertilizer materials. The total value of the imports also declined, falling from $3,063,547 in 1948 to $2,358,557 in 1949. France, Chile, and Algeria, in the order given, were the principal supplying countries in 1949. None is reported to have come from Russia.

Potash for fertilizer use constituted 92 percent of the total K_2O imports in 1949, 4 percent less than in the previous year. Imports for chemical use rose from 4 percent in 1948 to 8 percent of the total in 1949.

The principal potash salt imported in 1949 for fertilizer use was muriate (chloride), which entered from France and Canada. A little potassium sulfate (631 tons) came from Germany. Chile supplied 6,802 tons (952 tons K_2O) of crude sodium-potassium nitrate mixtures, whereas none had entered the previous year. Imports of potassium bitartrate were considerably greater than in the previous year and formed 96 percent of the total imports for chemical use.

[7] Figures on imports and exports compiled by M. B. Price and E. D. Page, of the Bureau of Mines, from records of the U. S. Department of Commerce.

Potash materials imported for consumption in the United States, 1948–49, by countries, in short tons[1]

[Figures in parentheses in column headings indicate, in percent, approximate equivalent as potash (K_2O)]

Exports.—The total value of the export trade in potash materials declined in 1949 from the previous year, dropping from $8,288,955 in 1948 to $7,110,054. The value of the exports of potash fertilizers has increased each year since 1946 and in 1949 reached $3,818,006, but the latest increase of 1949 over 1948 did not compensate for the decrease of nearly $1,500,000 in the value of potash chemicals exported in 1949. The exports of both fertilizer and chemical potash salts were widely distributed. The fertilizer materials (111,156 short tons, containing 61,914 tons K_2O) went mainly to Canada, with much smaller quantities to numerous other countries, mainly in the Western Hemisphere. The exports of chemical potash salts (15,598 tons, containing 7,643 tons K_2O) were more uniformly distributed. Canada and Hong Kong were the leading recipients, but large quantities went to Brazil, Italy, and Mexico.

Potash materials exported from the United States, 1945–49

WORLD REVIEW

Available statistics of potash output in the various producing countries, as well as estimated totals of world production, are shown in the accompanying table.

Two articles summarizing the world potash situation have been published recently.[8]

World production of potassium salts, by countries, 1944–49, in metric tons [1]

[Compiled by Helen L. Hunt]

Country [1] and kind of salt	1944		1945		1946	
	Potassium salts	Equivalent K_2O	Potassium salts	Equivalent K_2O	Potassium salts	Equivalent K_2O

[1] In addition to countries listed, Chile, Ethiopia, Iran, Italy, Poland, and U. S. S. R. are reported to produce potash salts, but statistics of production are not available; estimates by senior author of chapter included in total. (Estimate for Chile included only for the year 1949.)
[2] Data not available; estimate by author of the chapter included in total.
[3] Exports plus consumption, 1944–46.
[4] Production in fiscal years 1944–48 represents Palestine. Extracted from waters of Dead Sea.
[5] Estimate.
[6] Fiscal year ended June 30 of year stated.
[7] January to September, inclusive.

Australia.—An illustrated article describing the potash operations on the alunite deposits of Lake Campion in Western Australia was published in 1949.[9] The raw material is a dark-gray alunitic clay

[8] Horner, C. K., Potash Supply Influenced by Changing World Conditions: Foreign Commerce Weekly, vol. 38, No. 8, Feb. 20, 1950, pp. 3–4, 43–44.

occurring in the lake bed. This clay, when washed, contains about 7.25 percent K_2O. The plant is near the town of Chandler, 32 miles north of Merriden (a station on the Perth-Kalgoorlie railway). The lake is 426 acres in extent and contains some 12,000,000 tons of the alunitic clay down to 20 feet, although present excavations average only 7 feet. Borings show that the alunite persists in many places below 20 feet. Reserves are estimated at 1,500,000 tons of recoverable potassium sulfate and 2,000,000 tons of alumina. Rainfall in the lake area averages 10 inches a year; in winter there are 10 inches of water on the lake bed; in summer the water table lies some 30 inches below the surface.

The potash plant uses Diesel-electric power. The clay, excavated by dragline, is roasted, after crushing, in cylindrical roasters, using wood as fuel. The roasted material is leached with acid water, obtained from the Goldfields Water Supply Scheme, a 6-inch branch pipe delivering to the works at Chandler. Leach liquor passes to "mother-liquor" storage tanks, whence it is withdrawn to lines of stainless-steel crystallizing tanks. From these tanks the crystallized potassium sulfate is excavated and kiln-dried before bagging. It is hoped that this operation will make Australia independent of imported supplies.

Another article[10] estimated that the lake alunite would yield 750,000 tons of potash. The private company which set out to work the deposits in 1940 is said to have encountered financial difficulties, and operations have since been financed by the Western Australian Government.

Canada.—Early in 1949[11] it was reported that potash had been discovered at an oil-drilling site near North Battleford, northwestern Saskatchewan.

France.—The potash industry of Alsace has been described in articles published recently.[12] A 10-year development program initiated by the French after World War II called for a gradual expansion in output of the Mines domaniales de potasse d'Alsace up to 1,200,000 tons K_2O in 1957. This project calls for the modernization of underground working methods through the introduction of mechanical loaders, shuttle cars, coal cutters, drilling machines, and other devices. Equipment for treatment by levigation and flotation will supplement the old thermal plants and eventually supersede them. The project was approved by the Economic Cooperation Administration of the United States, which will contribute $4,000,000 in assistance funds.[13]

The Sociéte des mines de potasse et de magnesia du Boudigot, operating in the potash field near Dax in southwestern France, continued exploration with the object of developing a production capacity of 3,000 tons of potash monthly. Work is proceeding on the 400- and 650-meter levels. At 400 meters considerable tonnage has been observed but the content is poor and this zone will be fully exploited only when concentration methods now being studied are completed.

[13] Economic Cooperation Administration press release 752, Aug. 4, 1949, 1 p.

At 650 meters several beds of 1–1.3 meters, containing between 15 and 20 percent K_2O, have been cut.[14]

Israel and Jordan.—Neither the northern nor the southern plant of Palestine Potash, Ltd., operated in 1949. Control of the plant at Sodom at the southern end of the Dead Sea was returned in August 1949 to the company by the occupying Israeli military authorities. This plant is reported intact. The northern plant remains in the hands of Hashemite Jordan.

Poland.—Rich and extensive potash deposits are reported to have been discovered in the Kujawy district (about 100 miles from Warsaw in western Poland). Production is not expected before 1952 or 1953.[15]

Union of South Africa.—Potassium, sodium, and magnesium salts are being recovered from sea water in the plant of the Vrany Chemical Corp., 4 miles north of Saldanha Bay on the west coast of the Union of South Africa. Production was started June 1, 1949. The plant, the first of its kind in South Africa, is said to have a handling capacity of 5,000,000 tons of sea water a day. It is built on a 1,100-morgen site, part of which is laid out in terraced pans, where the sea water is evaporated. The sea water is pumped through pipes laid under the breakers, 300 feet from the shore, and is then distributed through canals to the pans, where a controlled flow maintains a depth of 6 inches. The pans are lined with sun-dried clay to prevent seepage. The residue is scraped from the clay and taken to the purifying plants. Many of the pans are being cemented, and overhead framework is being constructed from which the water will be sprayed to induce more rapid evaporation.[16]

United Kingdom.—Potash was discovered near Whitby, North Yorkshire, England, in 1938–39 by the D'Arcy Exploration Co. in boring for oil. Three salt beds were struck between 3,655 and 4,775 feet. The first salt bed, 15 feet thick carried not more than 1 percent KCl. The second bed, from 3,920 to 4,193 feet, included a thin bed of sylvinite with a maximum KCl content of 34 percent. The third bed, from 4,312 to 4,775 feet, included a 45-foot deposit of polyhalite containing 15.6 percent K_2O.[17]

Salines—Miscellaneous

By Joseph C. Arundale and F. M. Barsigian [1]

GENERAL SUMMARY

THE mild business recession during the first half of 1949 was reflected in moderate declines in sales of many mineral and chemical materials. Consumers generally were adjusting inventories to a more satisfactory relation with the hesitant market. In some instances, inventory liquidations were reactions to higher prices for raw materials.

In the later months of 1949, the period of readjustment appeared to be over, and there were signs of resumption of all-out industrial activity which promised new records in production, sales, and consumption in the coming year.

Sales of calcium chloride, soda ash, and salt cake decreased. Sales of bromine compounds increased as a result of public demand for more and better gasoline in which ethylene dibromide is used as an ingredient of antiknock compounds.

CALCIUM CHLORIDE

Producers of calcium chloride (and calcium-magnesium chloride) from natural brines reported a smaller tonnage of sales in 1949 than in any postwar year. However, this important industrial material was still being consumed in large quantities for a wide variety of uses. Although no accurate use pattern is available, its hygroscopic and antifreeze properties are widely utilized for such purposes as stabilizing and controlling dust on soil and gravel roads, controlling ice on streets and sidewalks, in refrigerating brines, dustproofing coal, regulating the curing of concrete, as an antifreeze for ore and other material in stockpiles and in railway cars, and as a dehumidifier in storage areas and basements. The United States Department of Agriculture has recently developed a method of farm-drying seeds, using calcium chloride instead of conventional heat methods.[2]

Solvay Sales Division, Allied Chemical & Dye Corp., 40 Rector Street, New York 6, N. Y., published a booklet summarizing the effects of calcium chloride in portland-cement mixes.

The Dow Chemical Co. announced the start of production of calcium chloride in pellet form.

The following companies produced calcium chloride (and calcium magnesium chloride) from natural brines in 1949: California Rock Salt Co., 2436 Hunter Street, Los Angeles 21, Calif., plant at Amboy, Calif.; Hill Bros. Chemical Co., 2159 Bay Street, Los Angeles 21, Calif., plant at Amboy, Calif.; Desert Properties Co., Frank Thomas, receiver, 374 Court Street, San Bernardino, Calif., plant at Amboy, Calif.; Michigan Chemical Corp., 500 North Bankson, St. Louis,

Calcium chloride imported for consumption in and exported from the United States, 1945–49

[U. S. Department of Commerce]

Year	Imports		Exports	
	Short tons	Value	Short tons	Value
1945	4,040	$51,409	6,871	$188,141
1946	1,313	14,587	10,073	367,993
1947	250	5,514	11,955	502,818
1948	5	249	11,456	437,763
1949	(1)	20	21,094	507,845

[1] Less than 1 ton.

According to Oil, Paint and Drug Reporter the following prices on calcium chloride were quoted during 1949: Flake, 77–80 percent, paper bags, carlots, works, freight equaled, ton, $22; liquor, works basis 40 percent, tank cars, ton, $9; solid, 73–75 percent, drums, carlots, works, same basis, $20. Calcium chloride pellets, bags, carlots, works, were quoted at $29 per ton at the end of 1949.

BROMINE

Sales of bromine compounds increased substantially in 1949, the bulk of the increase being attributable to the quantity use of ethylene dibromide. With the Nation's automobile drivers demanding more and better gasoline, the peacetime use of this compound as an ingredient of antiknock compounds is reaching unprecedented levels.

A new plant for the extraction of bromine and other chemicals from sea water started production at Jacob's Bay, 4 miles north of Saldanha Bay, South Africa. This new plant is expected to produce 200 tons of bromine annually.[3]

The Ethyl-Dow Chemical Co. recovered bromine from sea water at Freeport, Tex., and continued to be the largest producer. The Dow Chemical Co., Midland, Mich., second largest producer, recovered bromine from Michigan well brines. American Potash &

[3] Chemical Age (London), vol. 60, No. 1562, June 18, 1949, p. 905.

Chemical Corp., 3030 West Sixth Street, Los Angeles 54, Calif., recovered bromine from Searles Lake, and Westvaco Chemical Division, Food Machinery & Chemical Corp., 405 Lexington Avenue, New York 17, N. Y., from its sea-water bitterns plant at Newark, Calif. The following won bromine from well brines: Great Lakes Chemical Corp., 502 Michigan National Bank Bldg., Grand Rapids 2, Mich., plant at Filer City, Mich.; Michigan Chemical Corp., 500 North Bankson, St. Louis, Mich.; Morton Salt Co., 120 South La Salle Street, Chicago 4, Ill., plant at Manistee, Mich.; Rademaker Chemical Corp., Eastlake, Mich.; and Westvaco Chemical Division, Food Machinery & Chemical Corp., South Charleston 3, W. Va.

According to Oil, Paint and Drug Reporter, potassium and sodium bromides, U. S. P., barrels or kegs, were quoted at 33–34 cents a pound during 1949. This represented no change from the previous year. Imports of bromine and bromine compounds totaled 87 pounds, whereas 925,639 pounds valued at $402,899 were exported.

Bromine and bromine in compounds sold or used by producers in the United States, 1945–49

Year	Pounds	Value	Year	Pounds	Value
1945	79,709,857	$14,796,229	1948	76,047,551	[1] $14,825,470
1946	42,780,925	8,560,434	1949	88,725,709	16,267,908
1947	78,177,650	14,837,104

[2] Revised figure.

IODINE

Dow Chemical Co., Midland, Mich., and Deepwater Chemical Co., Ltd., Compton, Calif, recovered iodine from waste oilfield brines in California. As there were only two domestic producers during 1949, the Bureau of Mines may not publish the statistics on production of iodine. However, domestic production in 1937 (the latest year for which figures were published) was nearly 300,000 pounds, and production in recent years has exceeded that figure.

A large part of the iodine consumed in the United States is used

as potassium iodide in photographic emulsions and animal feeds, but other important uses are in pharmaceutical preparations, iodized salts, dyes, and in organic synthesis. The results of a Bureau of Mines canvass of iodine consumption are shown in an accompanying table. A similar table shown in Minerals Yearbook, 1948, is not strictly comparable because it did not include all iodine consumed in making organic compounds.

Crude iodine consumed in the United States in 1949

Compound manufactured	Number of plants	Crude iodine consumed	
		Pounds	Percent of total
Resublimed iodine	5	117,965	11
Potassium iodide	9	753,911	69
Sodium iodide	5	42,453	4
Other inorganic compounds	7	34,676	3
Organic compounds	12	145,553	13
Total	[1] 22	1,094,558	100

[1] A plant producing more than 1 product is counted but once in arriving at total.

The history of the domestic iodine industry was summarized, and the process of recovering iodine from oil-well brines was described.[4]

A new periodical known as Iodine Abstracts and Reviews was prepared by the Iodine Fellowship at Mellon Institute and published by the Chilean Iodine Educational Bureau, Inc., 120 Broadway, New York 5, N. Y. This publication provides summaries of scientific and technical literature relating to the uses of iodine and its compounds in chemistry and in the industries.

According to the Oil, Paint and Drug Reporter, the price of crude iodine, kegs, ex-warehouse, Staten Island, was $1.729 a pound in January to August 1949. At the same time resublimed was quoted at $2.55–$2.65 per pound in bottles or jars. In September and for the remainder of the year, crude iodine in kegs was quoted at $1.52–$1.729, and resublimed, U. S. P., in bottles or jars at $2.30–$2.48.

Imports of crude iodine decreased in 1949; however, imports of iodine are characteristically erratic and generally bear little relation to current consumption rates. Large stocks are usually maintained in consuming countries, principally the United States, by Chilean Nitrate Sales Corp., sales agent for producers in Chile. Chile was the principal foreign source of iodine, but Japan is supplying increasing quantities recovered from seaweed.

Crude iodine imported for consumption in the United States, 1945–49

[U. S. Department of Commerce]

SODIUM COMPOUNDS

Sodium Carbonate.—After several years of serious world-wide shortages of alkalies, the situation was reversed, and in 1949 a condition of general oversupply was a problem in the case of soda ash. Domestic producers of natural sodium carbonate reported a sharp drop in sales, and there were numerous reports of shut-downs or curtailments at plants throughout the world. Value of domestic sales of natural soda ash was off more than a third. Stocks were adequate for prompt shipments throughout the year. Consumption of this major alkali in such products as glass, caustic soda, bicarbonate, and other chemicals dropped. Exports were only a fraction of the previous year, due to the world dollar shortage, the effects of devaluation, and increased availability from foreign sources.

Natural soda ash was produced in California by the following companies in 1949: American Potash & Chemical Corp., 3030 West Sixth Street, Los Angeles 54, Calif., on Searles Lake; Natural Soda Products Co., 506 Central Tower Building, San Francisco 3, Calif., plant at Keeler; Pittsburgh Plate Glass Co., Columbia Chemical Div., Bartlett, Calif.; and West End Chemical Co., 608 Latham Square Bldg., Oakland 12, Calif., plant at Westend.

Manufactured sodium carbonate produced [1] and natural sodium carbonates sold or used by producers in the United States, 1945–49

Year	Manufactured soda ash (ammonia-soda process) [2]	Natural sodium carbonates [3]	
	Short tons	Short tons	Value
1945	4,375,017	194,045	$3,034,118
1946	4,284,231	215,625	3,427,086
1947	[4] 4,524,668	293,051	5,862,178
1948	4,575,452	[5] 288,769	[5] 6,623,280
1949	3,916,016	[5] 200,496	[5] 4,163,714

[1] U. S. Bureau of the Census.
[2] Total wet and dry (98–100 percent Na_2CO_3). Includes quantities used in manufacturing caustic soda and sodium bicarbonate and quantities processed to finished light and finished dense soda ash.
[3] Soda ash and trona.
[4] Revised figure.
[5] Exclusive of Wyoming.

On January 1, 1949, soda ash was removed from export-license requirements except for certain destinations. A summary of this alkali export-control program was published.[5]

Certain export practices of the United States Alkali Export Association and the California Alkali Export Association and their members were held in violation of the antitrust laws.[6]

Announcement was made that a large soda-ash plant was to be erected on the Vaal River near Douglas, Northern Cape Province, South Africa. Source of the brine to be used is a 500-acre salt lake, 22 miles away, from which the brine will be pumped. The projected output of soda ash is 300 short tons daily.[7]

[7] American Consulate General, Capetown, South Africa, Rept. 32, June 7, 1949.

The price of soda ash, light, 58 percent, bags, carlots, works, was quoted at $1.40 a 100 pounds in 1949, according to Oil, Paint and Drug Reporter.

The consumption pattern of sodium carbonate, as estimated by Chemical Engineering, is shown in the accompanying table.

Estimated consumption of sodium carbonate in the United States, 1945–49, by industries, in short tons

[Chemical Engineering]

Industry	1945	1946	1947	1948	1949
Glass	1,320,000	1,400,000	1,440,000	1,370,000	1,190,000
Soap	150,000	120,000	135,000	[1] 130,000	125,000
Caustic and bicarbonate	1,114,000	1,128,000	[1] 1,130,000	1,137,000	850,000
Other chemicals	960,000	910,000	1,030,000	1,030,000	950,000
Cleansers and modified sodas	110,000	125,000	130,000	135,000	130,000
Pulp and paper	175,000	190,000	[1] 260,000	230,000	200,000
Water softeners	100,000	90,000	100,000	110,000	110,000
Petroleum refining	24,000	20,000	22,000	24,000	24,000
Textiles	68,000	77,000	71,000	69,000	55,000
Nonferrous metallurgy	200,000	140,000	190,000	210,000	210,000
Exports	70,000	67,000	107,000	[1] 207,000	77,000
Miscellaneous	290,000	223,000	[1] 185,000	[1] 220,000	179,000
Total	4,581,000	4,490,000	4,800,000	[1] 4,872,000	4,100,000

[1] Revised figure.

Sodium Sulfate.—Sales of natural sodium sulfates by producers in 1949 dropped sharply, as did production of salt cake (including natural sodium sulfates). Conforming to the general trend of industrial activity, the consumption of salt cake in such industries as kraft paper, glass, stock feeds, metallurgy, and detergents all declined.

The following firms reported production of natural sodium sulfates in 1949: American Potash & Chemical Corp., 3030 West Sixth Street, Los Angeles 54, Calif., on Searles Lake; Arizona Chemical Co., 30 Rockefeller Plaza, New York 20, N. Y., plant at Brownfield, Tex. (sold to Heat & Power Co., 70 Pine Street, New York, N. Y., January 27, 1950); Dale Chemical Industries, Inc., P. O. Box 319, Twenty Nine Palms, Calif.; Iowa Soda Products Co., P. O. Box 476, Council Bluffs, Iowa, plant at Rawlins, Wyo.; Ozark-Mahoning Co., P. O. Box 449, Tulsa 1, Okla., plant at Monahans, Tex.; and William E. Pratt, P. O. Box 738, Casper, Wyo.

The sodium sulfate deposit and producing facilities of Saskatchewan Minerals, at Lake Chaplin, Province of Saskatchewan, Canada, were described.[8]

According to the Oil, Paint and Drug Reporter, at the first of the year domestic salt cake was quoted at $25–$28 a short ton, bulk, works. Later in the year, this material was quoted on a delivered basis at $24–$26 a short ton. Anhydrous sodium sulfate was unchanged at $2.10 per 100 pounds, works; Glauber's salt was unchanged at $2.25–$2.50 per 100 pounds, less than carlots, bags, works.

1946	22,446	352,407					22,446	352,407
1947	49,157	583,377	91	$1,760			49,248	585,137
1948	29,612	468,561					29,612	468,561
1949	21,090	294,367	53	1,152	245	$4,953	21,388	300,472

Sodium Metal.—E. I. du Pont de Nemours & Co., Inc., Niagara Falls, N. Y., and Ethyl Corp., Baton Rouge, La., produce metallic sodium, estimated annual output capacities of the two plants being 75 and 64 million pounds, respectively.[9] During 1949, Ethyl Corp. expanded its plant capacity by an estimated additional 36 million pounds. In Ashtabula, Ohio, National Distillers Chemical Corp. was constructing a new $10,000,000 facility, also with an estimated 36-million-pound annual capacity.[10] Production at the latter plant was expected to start early in 1950. During World War II, Dow Chemical Co. produced sodium at Midland, Mich.

Sodium metal is most extensively used as a chemical raw material, principally for the production of tetraethyl lead, lesser quantities being required in making sodium cyanide, synthetic detergents (sodium alkyl sulfate), etc. The approximate end-use pattern for sodium

[9] Zabel, Herman W., Metallic Sodium, Its Production and Use: Chem. Ind., vol. 65, No. 5, November 1949, pp. 714–716.
[10] Chemical and Engineering News, vol. 27, No. 22, May 30, 1949, p. 1602.
National Distillers Chemical Corp., Sodium: July 1949, 50 pp.

metal in 1947 and 1948 is shown in the following table; figures shown indicate millions of pounds.[11]

Use:	1947	
Tetraethyl lead	66	90
Sodium cyanide	25	32
Sodium alkyl sulfate	25	
Sodium peroxide	7	7
Sodium hydride	2	2
Indigo synthesis	2	2
Miscellaneous	6	6

Miscellaneous uses for sodium include its employment as metal in sodium-cooled engine valves and in special heat exchangers. Sodium is also used in producing potassium metal. Both sodium metal and sodium-potassium alloys have been seriously considered by the Atomic Energy Commission for use in proposed nuclear reactor heat exchangers.

Prices for sodium metal in 1949 were 16½ cents per pound in drums, carlots; 17 cents per pound, less than carlots.

BORATES

After slumping in 1948, sales of boron minerals increased in 1949, and total sales for the year approached the record high of 1947. Imports declined, but exports set a new all-time high. Although domestic consumption of boron minerals was the lowest in the postwar period, a large tonnage of exports more than offset this decline.

The technical literature included articles on the nature of the action of boron in hardening of various steel alloys,[12] the effects of borax in porcelain enamels,[13] a new high-temperature titanium-boron steel,[14] the thermodynamics of boron carbide,[15] and the properties of chromium boride and sintered chromium boride.[16]

Salient statistics of the boron-mineral industry in the United States, 1945–49

	1945	1946	1947	1948	1949
Sold or used by producers: [1]					
Short tons:					
Gross weight	325,935	430,689	501,935	450,932	467,592

Value [2]	$7,635,365	$9,575,866	$11,844,108	$11,147,735	$11,511,893
Imports for consumption (refined):					
Pounds	1,344	100,567	[3] 1,884	3,056	886
Value	$491	$4,077	$747	$1,503	$435
Exports:					
Short tons	43,475	53,303	85,736	70,940	109,491
Value	$2,059,510	$2,644,760	$4,651,642	$4,075,049	$6,862,928
Apparent consumption: [4]					
Short tons	282,461	377,436	416,200	379,994	358,101

[1] Borax, anhydrous sodium tetraborate, kernite, boric acid, and colemanite.
[2] Partly estimated.
[3] Revised figure.
[4] Quantity sold or used by producers plus imports minus exports.

[11] Work cited in footnote 9.
[12] Chemical Age, vol. 61, No. 1569, Aug. 6, 1949, Metallurgical Section, pp. 195–196.
[13] Ceramic Industry, vol. 52, No. 5, May 1949, p. 59.
[14] Steel, vol. 124, No. 26, June 27, 1949, pp. 58–61, 92 and 94.
[15] King, E. G., High-Temperature Heat Content of Boron Carbide: Ind. Eng. Chem., vol. 41, No. 6, June 1949, pp. 1298–1299.
[16] Sindeband, S. J., Properties of Chromium Boride and Sintered Chromium Boride: Jour. Metals, vol. 1, No. 2, February 1949, pp. 198–202.

In 1949 the following firms reported production of boron minerals: American Potash & Chemical Corp., 3030 West Sixth Street, Los Angeles 54, Calif., plant at Trona, on Searles Lake; Pacific Coast Borax Co., 510 West Sixth Street, Los Angeles 14, Calif., mine at Boron; Pittsburgh Plate Glass Co., Columbia Chemical Division, Bartlett, Calif.; United States Borax Co., 510 West Sixth Street, Los Angeles 14, Calif., mine near Shoshone; and West End Chemical Co., 608 Latham Square Bldg., Oakland 12, Calif., plant at Westend, on Searles Lake.

New prices in effect January 1, 1949, on borax and boric acid eliminated the 1-percent cash discount and were on a straight f. o. b. basis instead of the former freight split arrangement. This resulted in net increases to eastern buyers. According to Oil, Paint and Drug Reporter, the price of technical borax, 99½ percent, granular, bulk, carlots, works, was $31.25 a short ton.

Salt

By Florence E. Harris and E. M. Tucker

GENERAL SUMMARY

TOTAL salt production in 1949 receded more than 800,000 short tons from the 1948 production—a decrease of 5 percent. Most of the recession occurred in rock salt, the output being 10 percent less than in the preceding year. Total salt content in brine declined 5 percent. Evaporated-salt output, however, increased 2 percent.

Thirteen States and Puerto Rico produced 15,590,697 short tons valued at $54,048,226. Imports increased slightly; apparent consumption and exports decreased.

Salient statistics of the salt industry in the United States, 1935–39 (average), and 1945–49

	1935–39 (average)	1945	1946	1947	1948	1949
Sold or used by producers:						
Dry salt:						
Evaporated (manufactured) short tons	2,507,374	3,182,570	3,249,457	3,158,718	3,207,403	3,284,361

[2] 96,479 short tons valued at $2,347,679, shipped under the U. S. Army Civilian Supply Program, is excluded from exports shown but is deducted from apparent consumption.
[3] Revised figure.
[4] Quantity sold or used by producers plus imports minus exports.

In 1949, 46 companies produced salt in 71 plants compared with 43 companies and 71 plants in 1948.

Figure 1 shows that both the industrial production and salt-production index lines dropped. Industrial production was 16 points lower in 1949 than in 1948. However, the 1949 dry-salt index was only 6 points lower. The brine index, although 12 points lower than in 1948, was still 34 points above the industrial production line. In 1948 the brine index was 30 points above the industrial production.

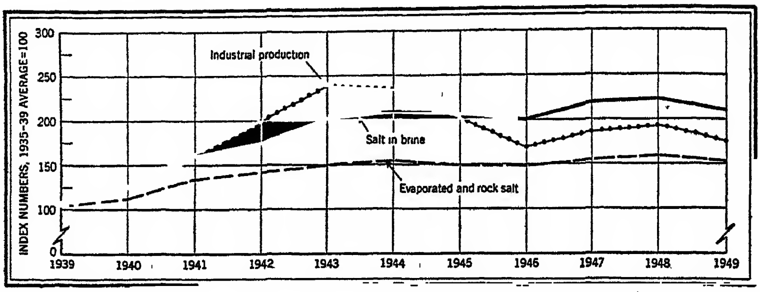

FIGURE 1.—Index of salt in brine and of evaporated and rock salt sold or used compared with industrial production, 1939–49. Index of industrial production from Federal Reserve Board.

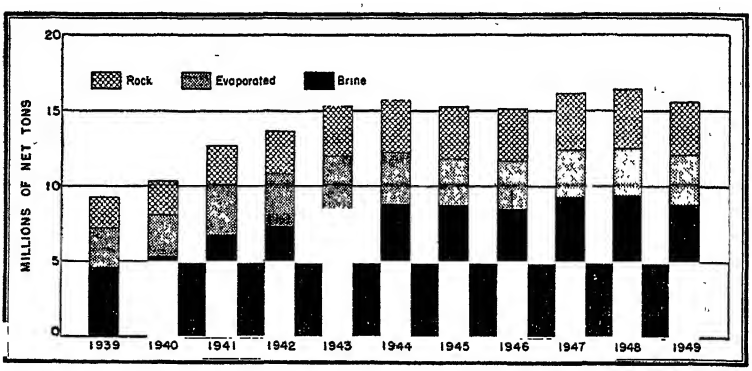

FIGURE 2.—Trends in the quantity of rock salt, evaporated salt, and brine (in terms of salt content) sold or used by producers in the United States, 1939–49.

Trends in the past 15 years are shown in the accompanying table as 5-year averages.

Salt sold or used by producers in the United States, 1935–49 (5-year averages), in short tons

Type	1935–39 (average)	1940–44 (average)	1945–49 (average)
Evaporated salt	2,507,374	3,311,152	3,216,502
Rock salt	1,947,254	2,878,860	3,597,390
Salt in brine	4,205,587	7,351,028	8,900,939
Total	8,660,215	13,541,040	15,714,831

A review of the economics of the salt industry, including descriptions of the world's principal deposits, was published.[1] The Bureau of Mines prepared a guide to cost estimates of chemical processes, which may have some application to salt making.[2]

[1] Phalen, W. C., Salt: Industrial Minerals and Rocks, Am. Inst. Min. and Met. Eng., New York, 2d ed., 1949, pp. 807–843.

[2] Van Noy, C. W., Dunville, T. C., Dreisler, R. G., and Chaffee, C. C., Guide for Making Cost Estimates of Chemical-Type Operations; Bureau of Mines Rept. of Investigations 4534, 1949, 64 pp.

A report[3] on the Retsof mine, in New York, was issued in 1949. A recent book,[4] popularly written, covers a good deal of the history of the salt industry, especially the Morton Salt Co.

Corrosion has always been a serious problem in the production and use of salt occurring in the production equipment and in salt storage places. It must be overcome not only because of the damage it causes to expensive metal equipment and machinery but also for maintenance of the purity of salt for chemical processes and for food preservation.[5] It was reported[6] that many new developments in corrosion-resistant coatings, plating, and metallurgy were discussed in papers presented before the ninety-fifth convention of the Electrochemical Society in Philadelphia in 1949.

PRODUCTION

PRODUCTION BY STATES

California.—The Reeder Salt Co. produced rock salt at Rice, San Bernardino County, Calif., in 1949. The Dale Chemical Co., Twentynine Palms, had no output of salt during the year. Production of salt by the Long Beach Salt Co. at Dry Lake, Kern County, depends upon rain. As there was no rainfall in the vicinity in 1949, there was no output. A report[7] describes the works, which consist of six vats covering 69 acres. Water pumped into a ditch, 20 feet wide by 3 feet deep, empties into vats one-half mile from the pump. The company has discontinued refining table salt. The product is used for stock salt, hides, fish bait, chicken feed, and hay.

Salt sold or used by producers in the United States, 1947–49, by States

Kansas.—Morton Salt Co. reports that its mine at Kanopolis, Kans., was abandoned permanently on June 30, 1949.

New Mexico.—It was announced [8] that salt lake areas at Willard, Torrance County, N. Mex., had been leased and would be worked soon for salt as an ingredient for a new type of fertilizer. It is planned that shallow wells will be drilled in the lake bottoms for the extraction of brine ("liquid salt"). The product, it was stated, is to be a "soil activator" for citrus orchards. The plant will have 20 employees at the start.

Texas.—The Frontier Chemical Co., Denver City, Tex., produced brine for chemicals in 1949. The assets of the Imperial Salt Co., Henderson, were taken over by the Gulf Salt Co., organized in 1949, at Houston. The Morton Salt Co. plant at Grand Saline, damaged by fire in the fall of 1948, was moved to the company salt mine outside Grand Saline. The usable refinery and other equipment were rebuilt and production was resumed. The Texas Brine Corp., operating at Hockley, produced brine in 1949.

Utah.—Jesse Coulson, Nephi, Utah, has closed and produced no salt in 1949.

West Virginia.—J. Q. Dickenson & Co., Malden, W. Va., reports that the plant was temporarily closed in 1949 and no salt produced. However, some purchased salt was resold.

Puerto Rico.—Salt production declined in Puerto Rico because of excessive rainfall, which not only prevented new production but leached salt in stock. A 2-month strike at one operation during the chief producing period also interfered with output. Prices remained the same as in 1948. Puerto Rican salt is used for household purposes, cement manufacture, and curing hides.

PRODUCTION BY METHODS OF RECOVERY

Basic methods of salt recovery were described briefly in the Salt chapter of Minerals Yearbook, 1948. The accompanying table shows the quantities produced by the various methods.

Salt sold or used by producers in the United States, 1948–49, by method of recovery

Method of recovery	1948		1949	
	Short tons	Value	Short tons	Value
Evaporated:				
Bulk:

Evaporated Salt.—Produced either from the original brine of wells and ponds or from artificial brine made by forcing water into beds of rock salt, the evaporated-salt output was contributed by 45 plants in 12 States and Puerto Rico. In 1949 the tonnage increased by 76,958 short tons over that of 1948.

Evaporated salt sold or used by producers in the United States, 1948–49, by States

State	1948		1949

[1] Includes Nevada, New Mexico, Oklahoma, Texas, and Utah.

Rock Salt.—As in 1948, rock salt was produced in eight States although from 20 mines compared with 19 mines in 1948. Production declined 378,841 short tons in 1949 from the record high of 1948. Rock salt entered the 3-million-ton bracket in 1943, has continued therein ever since, and consistently has represented more than 50 percent of the annual output of dry salt.

Rock salt sold by producers in the United States, 1945–49

Year	Short tons	Value	Year	Short tons	Value
1945	3,505,740	$12,964,391	1948	3,846,846	$16,970,742
1946	3,412,008	13,308,001	1949	3,468,005	16,396,642
1947	3,754,353	15,989,680			

Pressed Blocks.—In 1949 pressed blocks were made of evaporated salt by 23 plants and from rock salt by 9 plants. As shown in the following table, primary salt producers make many more blocks from evaporated salt than rock salt. The total output of blocks increased 8,711 tons in 1949 over 1948.

Pressed-salt blocks sold by original producers of the salt in the United States, 1945–49

Year	From evaporated salt		From rock salt		Total	
	Short tons	Value	Short tons	Value	Short tons	Value
1945	242,632	$2,479,109	94,811	$849,154	337,443	$3,328,263
1946	298,314	2,942,966	97,060	828,412	395,374	3,771,378
1947	260,399	2,708,857	69,163	638,958	329,562	3,347,815
1948	274,511	2,933,694	48,830	459,986	323,341	3,393,680
1949	268,838	3,230,985	63,214	597,892	332,052	3,828,877

Salt Content of Brine.—Seventeen operations produced brine in seven States. Although output declined 5 percent from that of 1948, salt of brine constituted 57 percent of total production of salt, as in 1948.

CONSUMPTION AND USES

The quantity of salt consumed in the United States declined in 1949. Except for chlorine making, water treatment, meat packing, other food processing, agriculture, and metallurgy, all other items showed decreases.

The largest consumption decrease was in salt of brine used for making soda ash, which totaled more than 1,000,000 short tons. Soda-ash operations especially were affected by the coal strike and the consequent long enforced idleness of steel works and dependent industries, all of which lowered the demand for salt for this chemical. Because of the generally mild winter, less rock salt was required for ice control on city streets, railroad switches, and similar purposes; this was reflected in the decline in rock-salt output.

Salt sold or used by producers in the United States, 1948–49, by classes and uses, in short tons

Use	1948				1949

[1] Data for evaporated salt included with "Undistributed."
[2] Data for salt in brine included with "Undistributed."
[3] Comprises miscellaneous uses and data not presentable by classes (footnotes 1 and 2), including most exports.

The increase of more than one-half million tons of salt for chlorine making partly offset the decrease in the use for soda ash. The prolonged hot weather in 1949 increased requirements for chlorine for sanitation purposes and salt for water treatment. Moreover, there was great demand for chloral for making large quantities of DDT for exportation as well as for domestic use. Nevertheless, the over-all decline in salt content of brine was 5 percent. The increase in salt

used for meat packing is attributed to the large slaughter of hogs in 1949, as requirements are much greater for pork packing and curing than for other meat products.

Miscellaneous uses of salt not listed separately in the accompanying table include sales to State and Federal Governments and to industry for brick and tile, pulp and paper, synthetic rubber, oil-well drilling, laundering and cleaning, coal, and tobacco.

Primary shipments of salt to the various States are shown in the accompanying table. This is the only available measure of consumption by States.

Distribution (shipments) of evaporated and rock salt in the United States, 1948–49, by States of destination, in short tons

PRICES

At the point of production the average price of rock salt in 1949 was $4.64 per short ton in bulk and $9.46 per ton of blocks. Vacuum-pan evaporated in bulk was $9.72, solar salt $3.68, and evaporated blocks $12.02 a ton. The open-pan or grainer types of evaporated salt averaged $13.78. The latter figure includes products having a wide value range.

Prices quoted by Oil, Paint and Drug Reporter for common salt at New York City remained stable throughout 1949 as follows:

Prices of bagged salt in the United States in 1949, per 100 pounds

[Oil, Paint and Drug Reporter]

Rock salt, delivered, New York:	
Paper bags, carlots	$0.88
Burlap bags, carlots	.98
Paper bags, less than carlots	1.09–1.12
Burlap bags, less than carlots	1.19–1.22
Table, vacuum common fine, bags:	
Carlots, works	.98–1.08
Less than carlots, delivered, New York	1.20–1.32

In May 1949 another listing was added that appeared at times in the same journal as follows: Salt, USP,[9] in drums at 21 cents per pound.

Oil-drilling operations often reveal the existence of salt, and recent drilling in Western States has called attention to such findings and raised the question of their commercial value. The Paradox Valley formation, in which exploration has been carried on for years, extends from Colorado well into Utah. That part of the Paradox Valley formation that carries most of the salt is of the Pennsylvanian age, and the salt has usually been found at about 5,000 feet. Recent drilling showed that some of the salt occurred at a depth of 6,000 feet. However, no deposits that promise early commercial development have been reported. In Wyoming, ranchers are said to obtain some local surface salt for their cattle.

[9] United States Pharmacopoeia.

In other parts of the West, deposits such as those utilized in western Wyoming for cattle salt are worked for local use in a small way. In Missouri, a small operation supplies 4 or 5 barrels a day of crude salt, used locally for cattle. Such deposits are worked irregularly in New Mexico also.

FOREIGN TRADE [10]

Imports.—Only two countries supplied the slightly larger imports of salt in 1949 compared with those in 1948. Canada and Jamaica supplied almost equal tonnages. However, the value of the Canadian product—mostly table salt—was four times that of the Jamaican solar salt.

Salt imported for consumption in the United States, 1948–49, by countries

[U. S. Department of Commerce]

Country	1948		1949	
	Short tons	Value	Short tons	Value
Bahamas	697	$2,955		
Canada	1,878	26,441	3,264	$48,630
Jamaica	3,041	11,242	3,045	11,975
Leeward and Windward Islands	5	110		
Total	5,621	40,748	6,309	60,605

In 1949, no fish-curing salt was imported, following 768 tons imported in 1948. Most of the packaged fine salt from Canada was received through the Maine and New Hampshire customs (2,562 tons) whereas 215 tons were received by Hawaii; 8 tons by Alaska; and the remaining ton through Duluth and Superior Customs. The bulk salt from Canada totaled 433 tons through Michigan and 45 tons through Maine and New Hampshire customs office. Of the Jamaica salt, 65 tons of packaged salt was imported by Puerto Rico and all the bulk salt, 2,980 tons, through the Virginia customs.

Salt imported for consumption in the United States, 1945–49, by classes

[U. S. Department of Commerce]

Year	In bags, sacks, barrels, or other packages (dutiable) [1]		Bulk			
			Dutiable		Free (used in curing fish)	
	Short tons	Value	Short tons	Value	Short tons	Value
1945	1,572	$36,343	2,981	$37,047		
1946	275	4,456	2,571	20,161	1,407	$5,011
1947	377	8,571	1,533	14,322		
1948	1,591	20,971	3,262	17,033	768	2,744
1949	2,851	40,308	3,458	20,297		

[1] Includes 1,500 pounds valued at $40 imported free in 1945 and 2,000 pounds valued at $20 in 1946.

[10] Figures on imports and exports compiled by M. B. Price and E. D. Page, of the Bureau of Mines, from records of the U. S. Department of Commerce.

Exports.—The 1949 exports declined 7 percent from those in 1948. The 1948 figures were revised to include additional exports of 8,613 tons to Japan and 10,067 tons to Korea. In 1949 salt exports to Japan increased still further, whereas those to Korea decreased.

As reported by producers to the Bureau of Mines, far more evaporated salt than rock salt was exported—roughly, over 200,000 tons of evaporated salt and over 140,000 tons of rock salt.

WORLD REVIEW

North America.—Following the United States, *Canada* ranks second on the continent in salt production. In 1949 about 53 percent of Canadian output was dry salt of commerce and 47 percent salt of brine. Ontario, with six operations, contributed 82 percent of the total and Alberta, Manitoba, and Nova Scotia the remainder. Ontario's output is divided almost equally between commercial salt and brine salt. In the former the preponderance is fine salt. New chlorine and caustic soda plants were added by an American company to its development in Ontario.[11] The plant of Alberta Salt Co., Lindbergh, Alberta, opened officially on March 19, 1949. The plant has been in operation since June 1948. Capacity is said to be about 150 tons per day.[12] The two wells at Neepawa, Manitoba, are still the basis for the entire salt industry of the Province, according to a short history of salt in the Province.[13]

[14] Punjab only.
[15] January to September, inclusive.
[16] Fiscal year ended June 30 of year stated.
[17] Estimated by senior author of chapter.

No salt production was shown in Saskatchewan in preliminary official Canadian reports, but a recent article [14] reported the opening of a new salt refinery at Unity, Saskatchewan, by the Prairie Salt Co., Ltd., the first refinery of its kind in the Province. The output is to include free-flowing salt and high-grade salt for meat-packing and other industries, as well as salt with iodine and cobalt in loose form and compressed blocks for livestock feeding. The Dominican Information Center, New York, N. Y., announced in June 1949 that the *Dominican Republic* plans to increase its output of salt from the rock-salt mines in Barahona Province to 200,000 tons annually within the next 3 years. The goal for the first year (45,000 tons) is to be doubled the second year. Concurrently the Government planned to expand the Puerto Hermoso salt mines, Trujillo-Valdes Province, until 70,000 to 100,000 tons are produced.

South America.—In January 1949, it was announced [15] that, in an attempt to develop the alkali industry in *Brazil*, an agreement was entered into between the owner of a rock-salt deposit at Contiguiba, Sergipe State, and the Companhia Nacional de Alcalis and Industrias Brasileiras Alcalinas S. A. The deposit was estimated to have 100 million metric tons of salt. The first-named company planned to build its alkali plant at Cabo Frio and the second company at Sergipe near the salt beds. The companies were to have equal access to the

[14] Canadian and Process Industries, Salt Refining Opens in Saskatchewan: Vol. 33, No. 8, August 1949, p. 704.

salt beds. Brazil produces salt in less than a dozen locations, all in the coastal area. About 80 percent of the annual output is from the State of Rio Grande do Norte. In the interest of promoting and improving Brazil's salt production, a civil engineer and representative of the Brazilian National Institute of Salt visited the United States in the winter of 1948–49 and toured salt operations in the eastern and central parts of the country. He reported upon his study in 1949.[16] In *Chile* the production of salt evaporated from sea water and from underground water increased in the last decade, but the output of rock salt still predominates according to recent reports.[17] Argentina, Brazil, and Uruguay are Chile's best salt customers. Reserves are said to be large and output expandable when required. However, it is said that outward-bound ships from Europe to Argentina or Uruguay for shipments of meat or cereals use salt picked up as ballast at Cadiz, Spain, or other European ports and unload it at prices with which Chile is unable to compete. In Chile, the f. a. s. port of embarkation price for common salt is about $10 to $10.50 per sack of 165 pounds. Production of salt in *Netherlands Antilles* has almost ceased on Curaçao and is declining on the other islands of this group.

Europe.—In November 1949 a salt cartel was formed in Europe to include *Italy* and *Spain* with *France* and the *French colonies* Somaliland, West Africa, Morocco, and Tunisia. Expansion plans of the producers in other countries, especially Turkey, are understood to have hastened the formation of the cartel. It is of the "syndicate" type, involving a central sales company incorporated in Tangier.[18] No further development of the salt deposits discovered a few years ago in *Denmark* was reported in 1949. Annual consumption in Denmark has ranged from 85,000 to 100,000 tons, all of which is imported from European sources, chiefly Germany. The German salt is apparently industrial salt, and smaller quantities of finer grades are supplied by Great Britain and the Netherlands. The uses to which the salt are applied follow: 25 percent household, 25 percent slaughter houses, 15 percent tanneries, 5 percent fishing industry, 5 percent dairies, and 25 percent other industries. According to reports from the Office of Military Government for Germany (United States),[19] the output of chemicals from salt in *Germany* increased greatly in 1948 compared with earlier years. Caustic soda production was 63 percent and chlorine output was 39 percent higher than in 1936. Salt from German deposits was utilized. Salt is listed among the principal commodities to be imported by *Iceland* from *Spain* under a trade agreement signed December 17, 1949. Production data on sea salt in *Italy* from 1891 to 1947 were published in 1949.[20] Output of sea salt for years consistently ran larger than the rock-salt production. According to the press,[21] the Direction of Italian Monopolies, which controls salt production, proposes to increase the output from the principal salt bed in Italy, the Margherita di Savoia, 6 miles

[21] Chemical Age (London), Oct. 9, 1948, p. 492.

from the port of Barletta, to 500,000 tons annually. Revival of salt exports from this port is one objective. Yearly output from the bed is roughly 300,000 tons. Salt output in the *Netherlands* is increasing. The Royal Netherlands Salt Industry, Ltd., controls the country's salt industry. About 60 percent of the 1948 production was exported. Salt also was imported (about 100,000 tons) in the same year, from Germany, France, North Africa, and Italy. New salt deposits have been found near Trelleborg, Scania, *Sweden*, according to the Swedish Board of Trade.[22] Two wells are expected to produce more than 100,000 tons of salt yearly. Present Swedish salt consumption is said to be about 300,000 tons. *Switzerland* rather consistently produces about 100,000 metric tons of salt. Enough table salt for domestic requirements is produced, and normally a slight excess is exported.[23] "Kitchen salt" for industrial use is imported almost entirely from France. In 1947 imports of this type of salt totaled 248,000 tons and in 1948, 275,000 tons.

Asia.—*Arabia* has increased its salt exports to Korea. *China* held a 10-day conference in December 1949 to reorganize the salt administration. Attempts were made to increase salt production in Formosa in 1949, but the statistics do not show increased output. The operations are 50-percent Government-owned. Plans were made to supply Japan 500,000 metric tons in 1950. In *India* efforts are being made to increase salt production to self-sufficiency and to eliminate salt imports in 1950. The Central Advisory Committee is considering extensive development of salt works in the Kathiawar area to increase supplies materially. The zonal system of distribution was discussed, some manufacturers believing abolition of this system would remedy such scarcity as was experienced in 1949. Prices rose as a result of local scarcity. The Government also sought to increase production of sea salt which would contribute to expansion of the chemical industries. It is said that the price of salt will have to be lowered before it will be possible to build an alkali industry. *Japan's* salt production is partly by Government-licensed plants and partly by private, nonlicensed works. Since April 1945 output of salt has been permitted outside the Government monopoly system. The output of the nonlicensed plants is sold in the free market. The number of such producers is large, but their annual output appears to be irregular. During the past few years Japan has increased its salt imports. In 1949, in addition to large imports from the United States, Japan imported salt from Egypt, Italy, Indonesia, Thailand, China, and a number of other countries. *South Korea* approached a production of 200,000 tons in 1949 and imported about the same quantity. The United States supplied a sizable quantity, and some was obtained from Egypt, Arabia, and elsewhere. Reports giving details on the salt industry in Korea were published.[24] *Pakistan* and India signed an agreement to run from July 1949 to June 1950, whereby Pakistan was to supply India 700,000 tons of rock salt, but owing to lack of monetary adjustment following devaluation of India's currency in September 1949, the expected salt shipments were not actually made in

1949. Pakistan deposits of salt, especially in the Salt Range (West Punjab),[25] are large and important to the economy of the country. The Institute of Science, *Republic of the Philippines*, in cooperation with the Fish and Wildlife Service, United States Department of the Interior, published a report [26] on the salt industry and tests that were conducted on salt plots in the Philippines. *Turkey* is endeavoring to increase its salt production by developing a large solar-salt area from which raw salt is easily available, the greatest obstacle to overcome being poor transportation to the sea. Technical assistance financed by the United States Economic Cooperation Administration in modernization of two of Turkey's largest salt-producing plants in 1949 is expected to result in an increase in production to more than 400,000 tons. The *U.S.S.R.* deposits and production are known to be large, but accurate statistics are not available. Russian shipping hauled salt consignments from Poland to distant ports in 1949.

Africa.—*Egypt* is stepping up its salt exports to Korea, but its exports to Japan declined greatly. Salt shipments (which declined in 1948 from 1947) nevertheless were higher than those before World War II. On September 30, 1949, the 50-year lease of the Port Said Salt Association, Ltd., from the Egyptian Government expired but was extended for another year.[27] Some of the African countries have failed to resume their former production, notably *Libya* and *Italian Somaliland* (formerly). The last-named at one time produced annually about 200,000 tons of salt, almost all of which was exported. The output now is negligible, as the salt works at Dante have never been restored since most of them were dismantled and moved away in 1940. Italian Somaliland sold salt a little over a decade ago to Japan. Part of *Uganda's* ten-year development plan includes improvement and enlargement of existing native salt works at Lake Katwe.[28] In the *Union of South Africa* a new salt industry was established upon completion of a plant at Jacob's Bay in September 1949, financed entirely by South African capital. The plant, the first in the country and reported [29] to be the third largest of its kind in the world, will produce common salt and other salines and metals. It is expected that enough table and industrial salt to meet the Union's needs and provide substantial exports will be produced, and that output by the end of the first year will reach 200,000 tons. Recent production figures for the Union of South Africa are not available, but in 1948 it was reported [30] that total salt output from the South African pans (only source in the past) averaged 190,000 tons a year from 25 pans.

Oceania.—In *Australia* the salt production is from lake deposits and sea water—no rock salt. The operations in the State of Victoria were described in an article [31] that contained illustrations of the evaporation basins, removal of thatch from a salt stack of about 2,500 tons, shovel-loading crude salt for transport to refinery, inner condensers and salt stack, and silos for crude salt outside the refinery. Most of the salt from the lake deposits is used for agricultural and industrial purposes. In many instances the purchaser collects his own salt and pays the leaseholder £3/12 per ton. The size of the annual output is influenced greatly by the weather. Cobalt for soil deficiency is added to the salt blocks. In *New Zealand*, in 1949, a company with Government participation planned to start work on a solar-salt works at Lake Grassmere, South Island, using methods similar to those employed at San Francisco Bay, Calif. Within a few years an annual output of 25,000 tons is expected, and later 50,000 tons.

Sand and Gravel

By D. G. Runner and G. E. Tucker

GENERAL SUMMARY

PRODUCTION of sand and gravel in 1949 declined slightly from the record 1948 level, but the output was still well above the previous record established in 1942. As indicated in figure 1, the value of sand and gravel produced exceeded the 200-million-dollar mark for the third consecutive time.

In this chapter the terms "production" and "sales" are used interchangeably, inasmuch as stocks of sand and gravel are relatively small and fairly constant from year to year.

As shown in the accompanying salient statistics table, sales in 1949 of industrial sands by commercial operators differed widely from the 1948 figures. Sales of molding and engine sand showed the greatest decreases, while the output of glass, grinding and polishing, and fire or furnace sand was only slightly below 1948 levels. Sales of sand for building were virtually unchanged, while increases were recorded in the sales of all other classes of material. Production of gravel by commercial operators increased for all classes with the exception of material used for railroad ballast. Output of this gravel was about three-fourths of the 1948 production. The combined total of sand and gravel used on Government-and-contractor operations was higher than in 1948, all types of material registering increases except building gravel.

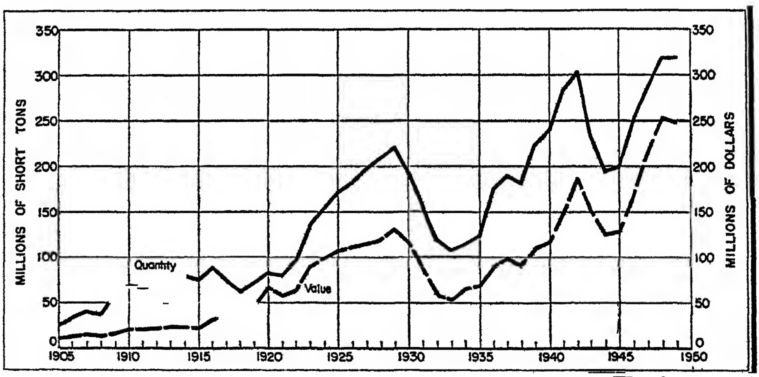

FIGURE 1.—Production of sand and gravel in the United States, 1905–49.

Sand and gravel sold or used by producers in the United States, 1948–49, by commercial and Government-and-contractor operations and by uses

[2] Includes ballast sand produced by railroads for their own use as follows—1948: 87,684 tons valued at $7,321; 1949: 169,219 tons, $13,748.
[3] Includes some sand used by railroads for fills and similar purposes as follows—1948: 197,379 tons valued at $34,213; 1949: 406,344 tons, $101,177.
[4] Includes ballast gravel produced by railroads for their own use as follows—1948: 5,126,293 tons valued at $1,823,741; 1949: 4,406,251 tons, $1,748,602.
[5] Includes some gravel used by railroads for fills and similar purposes as follows—1948: 1,145,673 tons valued at $478,962; 1949: 759,841 tons, $240,217.
[6] Approximate figures for States, counties, municipalities, and other Government directly or under lease.

PRODUCTION

The production of sand and gravel in 1949 totaled 319,104,000 short tons valued at $248,443,000, a decrease of 0.1 percent in quantity and 2 percent in value compared with the output of 319,266,000 tons valued at $252,498,000 in 1948. In general, industrial consumption slumped somewhat, but sand and gravel continued to benefit from the high rate maintained in construction activity during the year.

In 1949 California was the largest producer, followed by Michigan, New York, Illinois, Wisconsin, Texas, Ohio, Minnesota, and Pennsylvania in the order named. These nine States, each with an output exceeding 11,000,000 short tons, accounted for 51 percent of the total production.

The following tables show details of production, by States and uses, in 1949.

Sand and gravel sold or used by commercial and Government-and-contractor producers in the United States, 1945–49

Year	Sand		Gravel (including railroad ballast)		Total	
	Short tons	Value	Short tons	Value	Short tons	Value
1945	71,726,000	$54,856,000	123,798,000	$73,981,000	195,524,000	$128,837,000
1946	96,440,000	74,975,000	157,691,000	96,411,000	254,131,000	171,386,000
1947	108,719,000	94,154,000	178,940,000	122,715,000	287,659,000	216,869,000

[1] Figures that may not be shown separately are combined as "Undistributed."
[5] Includes 4,406,251 tons of ballast gravel valued at $1,748,602, produced by railroads for their own use.
[6] Includes 759,841 tons of gravel valued at $240,217, used by railroads for fills and similar purposes.

Government-and-Contractor Production.—As shown in the accompanying chart and tables, the output of sand and gravel from noncommercial or Government-and-contractor operations in 1949 accounted for 28 percent of the total tonnage, compared with 27 percent in 1948. The value of this output represented 15 percent of the total

dollar value for the industry. The increase in output may be accounted for largely by the increased utilization of material in paving construction.

States reported 50 percent of the total Government-and-contractor output in 1949, counties 39, Federal agencies 9, and municipalities 2. In 1949 contractors furnished 50 percent of the Government-and-contractor tonnage, as they did in 1948. The average value decreased from 48 to 42 cents per ton in 1949.

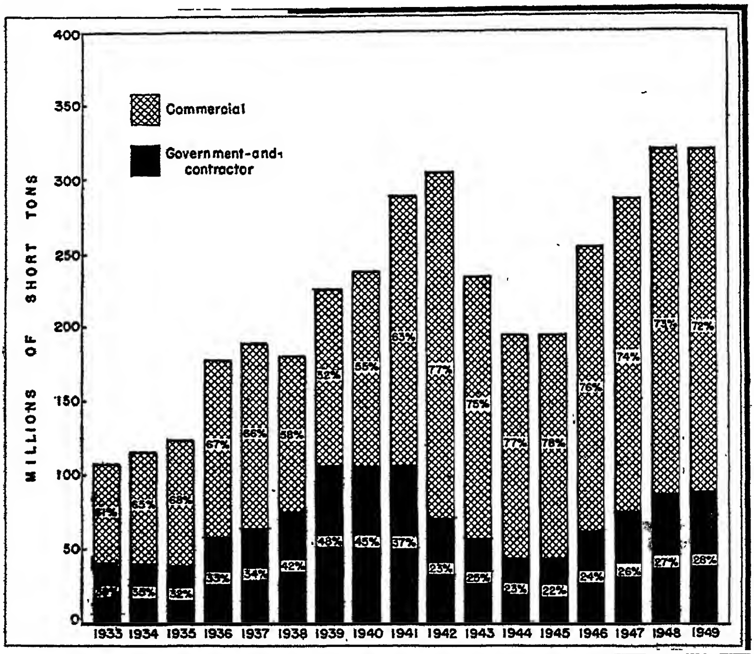

FIGURE 2.—Sand and gravel sold or used in the United States by commercial and Government-and-contractor producers, 1933–49.

DEGREE OF PREPARATION

Whereas Government-and-contractor sand and gravel commonly includes a high proportion of unprepared material, the reverse is true of commercial plants. As preparation adds substantially to production costs, commercial output has a higher average value. The accompanying table shows this relationship in the past 2 years. Prepared sand and gravel (commercial and Government-and-contractor) represented 74 percent of the total production in 1949 compared with 73 percent in 1948. This gain resulted largely from the increase in prepared material by Government-and-contractor operations during 1949.

Sand and gravel (prepared or unprepared) sold or used by producers in the United States, 1948–49, by commercial and Government-and-contractor operations

SIZE OF PLANTS

The average plant output of commercial operators, except railroad plants, approximated 92,000 short tons in 1949 compared with 96,000 tons in 1948. Plants producing 100,000 to 200,000 tons in 1949 accounted for 21 percent of the total output, the largest quantity produced by any one group. Plants producing more than 500,000 tons annually decreased from 63 to 57 and furnished 23 percent of the production. The less than 25,000 ton group showed the greatest expansion in number of plants—from 916 to 953. Details of output, by size groups, are shown in the accompanying table.

Comparison of number and production of commercial sand and gravel plants in the United States, 1948–49, by size groups [1]

Size group, in short tons	1948				1949			
	Plants [2]		Production		Plants [2]		Production	
	Number	Percent of total	Short tons	Percent of total	Number	Percent of total	Short tons	Percent of total
Less than 25,000	916	38.6	8,975,000	4.0	953	38.8	9,320,000	4.1
25,000 to less than 50,000	395	16.7	14,486,000	6.4	425	17.3	15,344,000	6.8

[1] Excludes operations by or for States, counties, municipalities, and Federal Government agencies as follows—1948: 774 with an output of 85,763,000 tons of sand and gravel; 1949: 807 operations, 87,899,000 tons. Excludes operations by or for railroads as follows—1948: 147 with an output of 6,557,000 tons of sand and gravel; 1949: 128 operations, 5,741,000 tons.

[2] Includes a few companies operating more than 1 plant but not submitting separate returns for individual plants.

METHOD OF TRANSPORTATION

Truck transportation in 1949 moved 41 percent of shipments from commercial plants (69 percent of total commercial and Government-and-contractor output). Railroads carried most of the remainder, but their portion of the total decreased from 25 percent in 1948 to 22 percent in 1949. Shipments by waterway, a method important in a few areas, was maintained at 6 percent, while 3 percent in 1949 was unspecified as to method of transportation. As shown in the accompanying table, the percentage of shipments (commercial and Government-and-contractor) moved by truck and rail accounted for 91 percent of the total tonnage.

Sand and gravel sold or used in the United States, 1947–49, by methods of transportation

	1947		1948		1949	
	Short tons	Percent of total	Short tons	Percent of total	Short tons	Percent of total
Commercial:						
Truck	107,381,000	37	125,468,000	39	131,725,000	41
Rail	75,942,000	26	78,888,000	25	70,035,000	22

[1] Entire output of Government-and-contractor operations assumed to be moved by truck.

CONSUMPTION TRENDS

Sand and Gravel for Construction.—The demand for sand and gravel by the construction industry in 1949, as indicated by shipments from commercial plants, showed a slight over-all increase over the previous year. Building sand remained at about the same level as in 1948, but increases in building gravel and sand and gravel for paving reflected the high rate of construction activity.

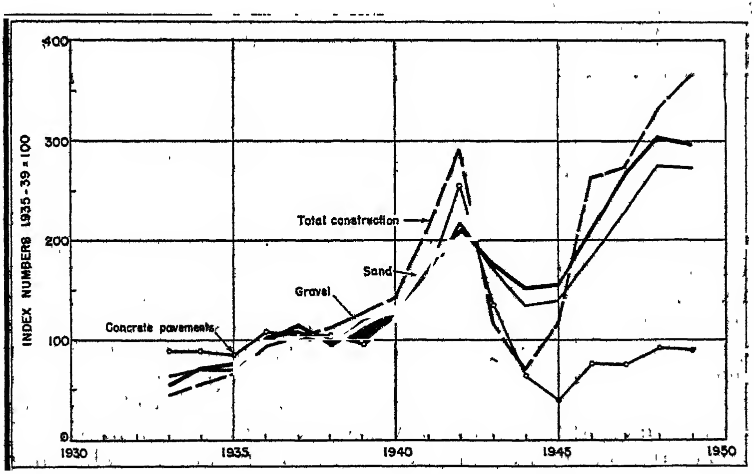

FIGURE 3.—Value of sand and gravel production compared with total construction (contract awards, value) and concrete pavements (contract awards, square yards) in the United States, 1933–49. Data on construction and pavements from Survey of Current Business.

Industrial Sands.—In general, the output of industrial sands declined in 1949. These decreases ranged from 1 percent for fire or furnace sand to 26 percent for molding sand, but the production of filter sand was 20 percent over the 1948 total. Coal strikes in 1949 no doubt hampered production of engine sand. Output of these sands depends on activity in the various consuming industries.

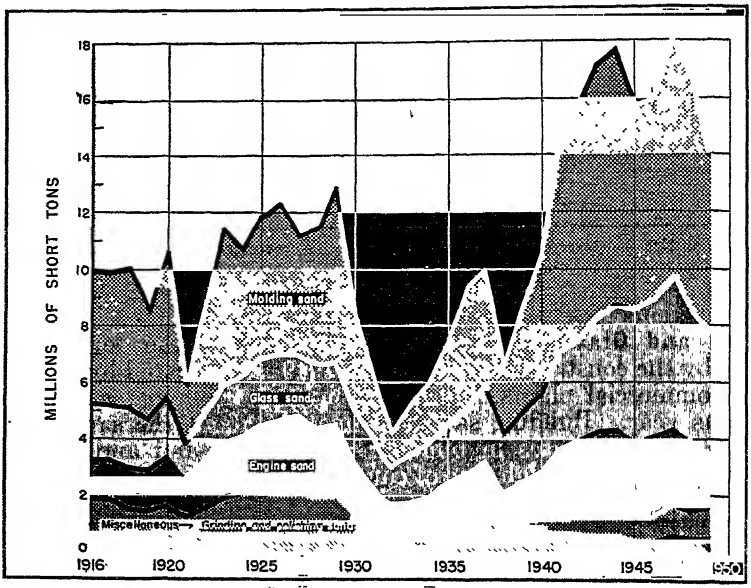

FIGURE 4.—Production of industria lsands in the United States, 1916–49.

EMPLOYMENT AND PRODUCTIVITY

The total number of men employed in the sand and gravel industry in 1949 averaged more than 26,000, slightly higher than in 1948. As indicated in the following table, the average number of days worked decreased from 246 in 1948 to 232 in 1949, while the average production per man per shift increased from 37.2 to 37.4 short tons. The accompanying table, showing a breakdown of employment and production, by regions, of commercial plants (except those operated by railroads), indicates that the California-Nevada region employed the greatest number of men and that the Wyoming-Colorado-New Mexico-Utah-Arizona region employed the smallest number. The highest production per man per hour and shift was reported from the Michigan-Wisconsin region.

Employment in the commercial sand and gravel industry and average output per man in the United States, 1945–49, by regions [1]

	Employment					Production (short tons)			Percent of commercial industry represented
		Time employed					Average per man

[1] Excludes plants operated by or directly for States, counties, municipalities, and Federal Government agencies.

PRICES

The average value for all shipments of sand and gravel in 1949 decreased 1 percent below the 1948 figures. While the average value for commercial plants increased only 1 percent in 1949, the value for

Government-and-contractor operations decreased 13 percent. Prices for commercial paving and building sand and gravel showed little fluctuation from 1948 levels; the greatest increase in these items was 3 cents for paving gravel. Changes in prices for the industrial sands ranged from an increase of 11 cents for glass sand to a decrease of 43 cents for filter sand; sand for railroad ballast, however, remained at 43 cents per ton. Gravel for railroad ballast and "other" uses decreased 2 and 10 cents, respectively, from 1948 figures. In the Government-and-contractor output sand and gravel for paving decreased in average value, whereas building sand and gravel registered substantial gains.

FOREIGN TRADE[1]

Imports of sand and gravel in 1949 declined to 434,170 short tons valued at $322,412, a decrease of 2 percent in quantity and 10 percent in value from the 1948 figures. Belgium furnished virtually all of the glass sand, while Canada supplied 285,688 short tons of "other sand," with Iceland, United Kingdom, and France supplying the balance. The gravel imported amounted to 135,227 short tons and came from Canada.

Sand and gravel imported for consumption in the United States, 1940–49, by classes

[U. S. Department of Commerce]

Year	Sand				Gravel		Total	
	Glass sand [1]		Other sand [2]					
	Short tons	Value	Short tons	Value	Short tons	Value	Short tons	Value
1940	4,337	$8,722	264,170	$90,350	175,558	$25,686	444,065	$124,758

[1] Classification reads: "Sand containing 95 percent or more silica and not more than 0.6 percent oxide of iron and suitable for manufacture of glass."
[2] Classification reads: 1940–47: "Sand, n. s. p. f."; 1948–49: "Sand, n. s. p. f., crude or manufactured."
[3] Less than 1 ton.
[4] Revised figure.

TECHNOLOGY

According to a recent announcement two plants are currently using a hydraulic classifier for washing silica sand for the glass and chemical markets. For these industrial uses the absence of clay is imperative, and the iron content must be held at a minimum. The plant equipment consists essentially of a high water column, baffle plates, and separate intercommunicating chambers for particle settling. Details are presented in the report.[2]

[1] Figures on imports and exports compiled by M. B. Price and E. D. Page, of the Bureau of Mines, from records of the U. S. Department of Commerce.
[2] Morris, A. B., Hydraulic Sand Classifier: Rock Products, vol. 52, No. 6, June 1949, pp. 109–113.

The possibility of utilizing the sink-float process in the sand and gravel industry was mentioned in the 1948 chapter. A description of the heavy-media separation for sand and gravel has been reported in the literature. This method was used to remove shale, limonite, chert, fossil corals, and hematite concretions from gravel.[3]

Two patents covering the testing of molding or foundry sands have been issued. United States Patent 2,466,453 describes an electrical instrument for determining the moisture content of foundry sands, while patent 2,448,964 describes an apparatus that measures the expansion characteristics of compacted molding sands at elevated temperatures.[4]

A technique of attrition that makes possible the production of high-quality sand for flint glass from a low-grade sandstone is described in a recent report.[5]

The scarcity of natural sand for construction purposes sometimes necessitates the manufacture of sand from massive rock. Granite, limestone, chert, and sandstone have been utilized as source material for the manufacture of sand.[6]

Committee C–9 on concrete and concrete aggregates of the American Society for Testing Materials, at the annual meeting in Atlantic City, N. J., adopted a proposed tentative method of test for soft particles in coarse aggregates (A. S. T. M. Designation: C — –49 T). This method of test covers the procedure for determining the quantity of soft particles in coarse aggregates on the basis of scratch hardness. The apparatus used is a brass rod about 1/16-inch in diameter and having a Rockwell hardness of B65 to B75. Details of sample size and procedure are given in the report of Committee C–9.

The passage of antistream pollution legislation in some States has given rise to the thought of impounding the tailings or finer rejects from aggregate plants. Several methods for building tailing ponds have been described.[7]

In connection with the improvement of the flow sheet of a sand and gravel plant, one operator in Pennsylvania installed a jaw crusher to process oversize rock that formerly had been rejected. The crusher was reported to incorporate a "crushing without rubbing" method.[8]

The problem of elongated particles in aggregate is one that has plagued operators for many years. An article describing a method of eliminating slivery particles at a combination crushed stone and sand and gravel plant has been reviewed.[9]

Secondary Metals—Nonferrous

By Archie J. McDermid [1]

GENERAL SUMMARY

THE GENERAL decline in industrial activity that occurred in the first half of 1949 caused sharp decreases in the consumption of nonferrous scrap metals. As a result, the outputs of secondary metal in 1949 were considerably below corresponding totals for 1948, although an upswing in later months of the year limited the loss. Another factor in declining demand for scrap metals was the replenishment of industrial inventories and working stocks and of the consumer goods made from them, which had been slow in rebuilding after depletion during World War II. Consumers of metals, both primary and secondary, finding that scarcity no longer existed and anticipating declines in market prices, adopted a policy of cautious buying. Users drew on raw material in inventory, buying only when stocks dropped below a minimum working level.

Salient statistics of nonferrous secondary metals recovered in the United States, 1948–49

Metal	From new scrap		From old scrap		Total

[1] Revised figures.

[1] Figures on imports and exports compiled by M. B. Price and E. D. Page, of the Bureau of Mines, from records of the Department of Commerce.

Under such conditions prices weakened, first scrap prices and then those of refined metal. Refiners were paying as high as 22 cents a pound for No. 1 copper scrap early in December 1948 but by the end of the month were purchasing it for 20.5 cents and by June 1949 for 12.5 cents. The price of refined copper remained at 23.5 cents a pound from August 1948 until March 1949 and then descended progressively to 16 cents in June. Similar trends were noted in the prices of scrap and refined lead and zinc. The market for aluminum scrap declined in the same period, but primary aluminum ingot prices remained at 17 cents a pound throughout 1949. Scrap-metal prices in general improved in the latter part of 1949 but did not reach the 1948 levels.

Consumption of lead scrap was affected not only by the business recession but by increased importation of lead from countries that devalued their currencies. Use of aluminum scrap and secondary ingot was also adversely affected by imports and by increased availability of primary aluminum. Although demand for nonferrous scrap metals was smaller in 1949 than in 1948, supplies of copper and aluminum scrap were scarce, chiefly because of the depleted sources of military scrap.

The value of metals recovered in 1949 from both old and new scrap was $597,991,938 compared with $856,429,877 (revised figure) in 1948. The decrease was attributable to smaller quantities recovered and in most instances to lower prices. The value of metals recovered from old scrap, after increasing for 6 years, declined from $478,845,316 (revised figure) in 1948 to $340,330,287 in 1949.

The figures for the values of secondary metals recovered are calculated on the basis of replacement of primary metals by secondary; that is, it is assumed that if the plants involved had not been able to use scrap in their operations they would have had to use primary metals worth the figures quoted above. The amounts are useful for year-to-year comparisons, but they do not represent actual receipts by the secondary plants for their products. As a matter of fact, the unit prices of secondary metals are usually somewhat less than those of primary metals of the same purity and composition. Secondary smelters operate through their ability to remelt scrap items of different compositions in the proper proportions to form ingot of specified grade at such a price that foundries will buy it instead of producing their own alloys from primary metals or scrap.

The War Assets Administration, which was created on March 25, 1946, by Executive Order under the Surplus Property Act of 1944, was abolished on July 1, 1949. Virtually all of the 27.2 billion dollars worth of property, including large quantities of scrap metals, that had been declared surplus to WAA had been disposed of. Surplus items remaining were assigned to the Liquidation Service of the General Services Administration for disposal.

Secondary metals recovered as unalloyed metal, in alloys, and in chemical compounds in the United States, 1945–49, in short tons

Metal	1945	1946	1947	1948	1949

SCOPE OF REPORT

Plants canvassed in nonferrous secondary metal surveys include all known consumers of purchased nonferrous scrap metals, as well as consumers of refined copper and brass ingot. The accompanying table classifies the plants canvassed by type of operation and kind of material consumed. Secondary smelters have been recorded in more than one column if they used more than one kind of material; otherwise, there is no duplication. The tabulation of the number of plants in some categories is subject to limitations. The large number of foundries and the small size of many of them makes it impossible to obtain reports from all units. On the other hand, a few large corporations operating more than one plant prefer to file consolidated reports, in which the number and location of plants are not given, with the result that only one plant is credited. These limitations, however, do not affect seriously the validity of the data presented.

The statements from industry, on which data in this chapter are based, were received monthly from the larger smelters, chemical plants, and manufacturers and from brass and wire mills. Foundries, primary aluminum producers, and smaller plants of other types were canvassed on an annual basis.

Number and classification of plants consuming nonferrous scrap metals, refined copper, and copper alloy ingots in 1949

Kind of plant	Type of materials used				
	Aluminum	Copper	Lead and tin	Zinc	All nonferrous types
Primary producers	[1] 32	16	8		
Secondary smelters	[2] 60	[3] 100	259	131	
Distillers				[4] 25	
Chemical plants	16	52		24	
Brass mills		52			
Wire mills		[5] 14			
Foundries and miscellaneous manufacturers			30	[6] 14	[7] 2,750

[1] Includes aluminum reduction plants and rolling mills.
[2] Includes 57 aluminum-alloy ingot makers and 3 naval air stations.
[3] Includes 70 secondary copper smelters and 30 smelters using copper scrap in other than copper alloys.
[4] Includes 17 secondary plants, including zinc-dust plants, and 7 primary producers which used scrap in addition to ore.
[5] Refers to companies operating wire mills. Some companies operate more than 1 plant.
[6] Includes galvanizers, die casters, and zinc rolling mills.
[7] Chiefly brass foundries, but some aluminum foundries, iron foundries, steel plants, and miscellaneous manufacturers. Any or all types of nonferrous scrap were used by these consumers. Excludes plants not established in Bureau of Mines surveys.

Definitions of terms used in this chapter are as follows:

"Secondary metals" are metals or alloys recovered from scrap and residues. The term "secondary" applies only to the source of the metal and has no relation to the type of product recovered, either as to quality, degree of purity, or physical characteristics.

Scrap metals are divided into three main categories: Old scrap, process or plant scrap, and defective finished or semifinished articles returned by purchasers to be reworked.

"Old" scrap is defined as consisting of metal articles that have been discarded because of wear, damage, or obsolescence, usually after serving a useful purpose. Typical examples of old scrap are discarded trolley wire, battery plates, railroad-car boxes, fired cartridge cases, automobile crank cases, used pipe, lithographers' plates, and obsolete military equipment (frequently unused).

"Process" scrap is that generated during the manufacture of articles for ultimate consumption. Typical examples of process scrap are clippings, turnings, borings, skimmings, slags, and drosses.

"Process" scrap is divided into two classifications: "Home" scrap, consumed in the plant of generation, and "new" scrap, which is consumed elsewhere, either after sale to another company or shipment to another plant of the same company. Defective articles, the third main class of scrap, are classed as new scrap for tabulation purposes. In this chapter consumption of old and new scrap only is tabulated, no record being kept, in nonferrous metal canvasses, of home scrap. Consumption of scrap is always measured at the point where it loses its identity as scrap and becomes secondary metal.

Borings and turnings and other items of process scrap when consumed outside the plant of generation are new scrap, whether clean, rusty, or oily and whether generated recently or long before reclamation. Residues are new scrap if generated in processing scrap or refined metal. For example, flue dust from smelting brass scrap is new scrap. Zinc chemical residues resulting from the consumption of zinc dust in the manufacture of sodium hydrosulfite are also new scrap. Residues generated in processing ore or concentrates are not scrap but primary residue. Old mine tailings are primary residue because generated in processing ore.

COMPARISON WITH PRIMARY METALS

Secondary and primary nonferrous metal operations in the United States, the United Kingdom, and western Germany are compared in the following tables. About 80 percent of the refined copper and lead and about 92 percent of the slab zinc shown as consumed in the United States table were of primary origin. The sequence of copper percentages in the British table shows that scrap as compared to refined copper was more important in war years than later, whereas the copper percentages in the United States table show no definite trend. The importance of secondary lead in relation to primary metal increased in both the United States and the British Isles in the period covered by the tables. The proportion of secondary metal in the slab zinc consumed in the United Kingdom is probably higher than in the United States, but assuming that all the slab zinc con-

[1] British Bureau of Nonferrous Metal Statistics, vol. 3, No. 3, March 1950, pp. 20, 45, 65.
[2] Includes pig lead refined from imported bullion.
[3] Lead reclaimed from secondary and scrap material and lead refined from domestic ores.

sumed in the United Kingdom was of primary origin a comparison of the zinc percentages indicates that zinc scrap was more important in relation to primary metal than in the United States.

The information about the German Republic was obtained through conversations with American officials who had been there recently or who had received reports on conditions in German nonferrous metal industry. The relatively high secondary production in Germany resulted from the abundance of demolition and battle scrap.

Comparison of secondary with total production and consumption of nonferrous metals in Federal Republic of Germany, 1949, in short tons

	Aluminum	Copper	Lead	Zinc
Production:				
From ores	31,000	31,000	53,000	98,000
From scrap	57,000	159,000	60,000	29,000
Total	88,000	190,000	113,000	127,000
Imports		22,000		
Exports			62,000	
Consumption	97,000	203,000	53,000	133,000

SECONDARY ALUMINUM

The recovery of secondary aluminum from scrap totaled 180,762 short tons, valued at $57,012,335, a decrease of 37 percent in quantity from the 286,777 tons, valued at $83,165,330, reclaimed in 1948. Values were calculated on the basis of the average price received by producers of primary pig, which was 14.50 cents a pound in 1948 and 15.77 cents in 1949.

Secondary aluminum [1] recovered in the United States, 1948–49, in short tons

Secondary aluminum recovered			Recoverable aluminum-alloy content of scrap		
Form of recovery	1948	1949	Kind of scrap processed	1948	1949
As metal	2,384	343	New scrap:		
Aluminum alloys	282,302	178,502	Aluminum-base [2]	190,736	135,789
In brass and bronze	455	450	Copper-base	99	82
In zinc-base alloys	776	600	Zinc-base	95	99
In magnesium alloys	354	426	Magnesium-base	199	196
In chemical compounds	506	441	Total	191,129	136,166
Grand total	286,777	180,762	Old scrap:		
			Aluminum-base [3]	95,101	44,030
			Copper-base	93	134
			Zinc-base	292	309
			Magnesium-base	162	123
			Total	95,648	44,596
			Grand total	286,777	180,762

[1] In accordance with common usage, the term "aluminum" covers aluminum alloys, and the figures include all constituents of the alloys recovered from aluminum-base scrap.
[2] Recoverable aluminum content of new aluminum-base scrap was 179,516 tons in 1948 and 128,012 tons in 1949.
[3] Recoverable aluminum content of old aluminum-base scrap was 86,028 tons in 1948 and 41,194 tons in 1949.

Of the recoverable aluminum content of nonferrous scrap consumed in 1949, 99 percent was contained in aluminum scrap, and 99 percent of the total secondary aluminum recovered was reclaimed in aluminum-base products. In other words, most aluminum-bearing scrap was used in aluminum products. The proportions were about the same in other years. Recovery from old scrap decreased from 48 percent of the total secondary recovery in 1947 to 33 percent in 1948 and 25 percent in 1949, chiefly because of decreasing supplies of aircraft scrap.

Production of all types of aluminum-alloy ingot except aluminum-copper- and aluminum-silicon-nickel alloys, decreased in 1949, but output of "Other aluminum-copper" ingot declined much more (89 percent) than that of any other important classification. Production from aircraft scrap, when melted separately, is usually assigned to this type of ingot. It is suitable for deoxidizing some kinds of steel and when made for that purpose may be classed as deoxidizing ingot. Ingot made from aircraft scrap, to which a little pure aluminum may have to be added, can be used for wrought products such as aluminum roofing and siding, but most of the alloy ingot made at secondary plants is used for castings. Total production of alloy ingot, secondary output at primary plants, and recovery of aluminum from scrap in aluminum castings decreased 38, 33, and 27 percent, respectively.

Production of secondary aluminum and aluminum-alloy products in the United States, 1947–49, gross weight in short tons

Product	1947	1948	1949
Secondary aluminum ingot: [1]			
Pure aluminum (98.5 percent)	5,052	2,328	326
Silicon (max. Cu, 1 percent)	12,370	11,786	7,376
Silicon (Cu, 1 to 2.5 percent)	5,108	4,694	3,532
No. 12 aluminum	27,605	19,509	10,605
Other aluminum-copper (max. Si, 2.5 percent) alloys	89,642	[2] 17,612	[3] 1,955
Copper-silicon (each over 2.5 percent) alloys	72,286	80,940	52,900
Aluminum-copper- or aluminum-silicon-nickel alloys	2,101	3,791	5,152
Deoxidizing and other destructive uses	28,965	34,143	23,828
Aluminum hardeners	2,695	3,989	2,209
Al-Mg and Al-Zn alloys	3,833	2,860	2,731
Miscellaneous	10,258	8,387	6,892
Total	259,915	190,039	117,506
Secondary aluminum at primary plants [4]	84,074	93,159	61,990
Aluminum powder [5]	53	56	17
Aluminum-alloy castings	7,645	5,289	3,872
Aluminum in chemicals	379	506	441

[1] Gross weight of alloys, including copper, silicon, and other added elements; total secondary ingot contained 1,525 tons of primary aluminum in 1947, 3,033 tons in 1948, and 2,206 tons in 1949.
[2] Includes 13,776 tons produced at naval air stations and plants of contractors melting down army planes.
[3] Includes 1,785 tons produced at naval air stations.
[4] Combined with primary aluminum for the production of wrought products and castings.
[5] Does not include production measured as ingot for graining, powder, atomizing, or chemical purposes.

There was a growing use of both aluminum and zinc in die castings, especially in the automotive industry. The aluminum die casting plant completed by the Ford Motor Co. in 1949 was reported to be the largest and most modern of its kind. A large increase in the use of aluminum die castings in 1951 Ford car models was expected.[1] This would not decrease the use of zinc die castings because virtually all of these castings were to be used in the new automatic transmission where use of zinc was never contemplated. Another automobile manufacturer is said to have helped develop a process for chrome plating aluminum which will increase the use of aluminum die castings. Several new types of zinc die castings were being used in convertible automobile models. A number of types of aluminum alloy ingot which can be made from scrap, are used for aluminum die castings but very little zinc scrap is used—only 658 tons in 1949—in zinc die castings. The chief ingredient of the latter is special high-grade slab zinc, of which 195,691 tons were used in this product in 1949.

Consumption of aluminum scrap in 1949 was 125,456 tons less than in 1948. The decrease can be attributed to increased availability of primary aluminum, to the business recession, and to imports of secondary ingot from abroad. Primary ingot was more plentiful in 1949 than it had been for a number of years. As primary production remained at virtually the same high level as in 1948 and demand was weaker, plants that had been using secondary ingot or scrap could turn to primary if they so desired. Imports of aluminum scrap were reported as 40,120 tons, much of it remelted into ingot for convenience in shipping. This remelt ingot when used in this country was not generally recorded as scrap consumed, and it reduced the demand for scrap because it was used in place of scrap that might have been consumed. Aluminum scrap consumption declined 39 percent; usage of primary aluminum declined 7 percent.

	New scrap	Old scrap	New scrap	Old scrap	New scrap	Old scrap	
Pure clippings, wire, and foil	9,618	273	15,057	61	241	17	25,267
Castings and forgings	14,310	12,027	3,646	2,310	499	1,109	33,901
Alloy sheet	21,027	2,511	32,561	890	1	60	57,050
Scrap sheet and sheet utensil		5,900	4,472	2,608	1,583	801	15,364
Borings and turnings	27,532		2,418		213		30,163
Aircraft scrap		10,188		1,513			11,701
Miscellaneous aluminum and dross	12,798	12,288		66	441		25,593
Total	85,285	43,187	58,154	7,448	2,978	1,987	199,039

Treatment of all classes of aluminum scrap decreased except that of scrap sheet and utensil, which almost doubled. All groups used more of this material, but the primary plants consumed 7,080 tons in 1949 as compared with 376 tons in 1948. Use of aircraft scrap declined sharply (79 percent), and that of alloy sheet, the largest item in both years, decreased 39 percent. The smallest decrease was 4 percent in consumption of borings and turnings. Secondary smelters and naval air stations consumed two-thirds of the total aluminum scrap processed in both 1948 and 1949. The rolling mills and reduction plants used about a third of the total in each year. Foundries and manufacturers of such products as drain cleaners, hair-wave pads, and chemicals used about 2 percent of the total in each year.

Consumers' stocks of aluminum-base scrap in the United States at end of year, 1948–49, gross weight in short tons

Scrap item	Dec. 31, 1948	Dec. 31, 1949
Castings and forgings	5,351	2,792
Sheet, turnings, clippings, etc	16,428	12,917
Aircraft scrap	2,716	2,212
Miscellaneous aluminum and dross	4,203	2,244
Total	28,698	20,165

Dealers' buying prices for cast aluminum scrap were highest in January, when they averaged 12.63 cents a pound. The lowest average was 5.75 cents in July at the end of a 7-month decline. For the final 2 months of the year the average price was 7.75 cents and for the year 7.76 cents. Prices for new aluminum clippings were 16.13 cents in January, dropped to 9.75 cents in July, and stood at 10.75 cents at the end of the year; the average for the year was 11.40 cents. The price of primary aluminum pig was 16 cents a pound throughout 1949.

Imports of aluminum scrap in 1949 were 40,120 tons compared with 71,732 tons (revised figure) in 1948. Exports were 397 tons in 1949 and 438 tons in 1948.

SECONDARY ANTIMONY

Antimony recovered in 1949 from lead- and tin-base scrap totaled 18,061 short tons valued at $13,990,051, a 16-percent decrease in quantity from the 21,592 tons valued at $15,835,573 reclaimed in 1948. The value was computed at 36.67 cents a pound in 1948 and 38.73 cents in 1949, the average New York selling price for primary antimony.

Of the total secondary antimony recovered, 16,286 tons were reclaimed at secondary copper and lead smelters and 1,775 tons at primary lead refineries. New supply of primary antimony from domestic and foreign sources available for consumption in 1949, in terms of recoverable metal, was 11,947 tons.

Secondary antimony recovered in the United States, 1948–49, in short tons

Secondary antimony recovered			Recoverable antimony content of scrap		
Form of recovery	1948	1949	Kind of scrap processed	1948	1949
In antimonial lead	14,163	11,566	New scrap:		
In other lead alloys	7,225	6,311	Lead-base	3,594	3,085
In tin-base alloys	204	184	Tin-base	----------	----------
Grand total	21,592	18,061	Total	3,594	3,085
			Old scrap:		
			Lead-base	17,816	14,809
			Tin-base	182	167
			Total	17,998	14,976
			Grand total	21,592	18,061

Old battery plates yielded 55 percent of all secondary antimony recovered in 1949. However, consumption of battery plates decreased 18 percent from the quantity used in 1948 and was 23 percent under the peak year of 1947. Secondary antimony recovered in antimonial lead, in other lead-base alloys, and in tin-base alloys also decreased. Remelters, smelters, and refiners recovered 94 percent of the secondary antimony reclaimed and manufacturers and foundries the remaining 6 percent. Data on consumption of purchased scrap from which antimony was recovered may be found in the tables on consumption of lead- and tin-base scrap in the sections of this chapter devoted to those metals. Products in which antimony was recovered are included in the lead- and tin-products tables.

All secondary antimony was reclaimed in lead and tin alloys, none being recovered as unalloyed metal; whereas 61 percent of the primary antimony used, exclusive of 1,610 tons of primary antimony recovered from lead-silver ores at primary lead smelters, emerged in metal products, chiefly lead and tin. About 100,000 tons of antimonial lead scrap were softened to produce refined lead, the resulting antimonial lead dross byproduct being used in other metallic products.

Control of receipts and inventories of antimony under General Preference Order M–112, was revoked on March 31. End-use restrictions had been lifted, and new supplies together with declining consumption made further control unnecessary.

Quotations for domestic antimony metal changed only once in 1949. On January 1 the price was 38.50 cents per pound f. o. b. New York; on October 6 it dropped to 32 cents and remained there the balance of the year.

SECONDARY COPPER AND BRASS

The recovery of secondary copper from all classes of nonferrous scrap totaled 713,143 short tons, valued at $280,978,342, in 1949—a decrease of 27 percent in quantity from the 972,788 tons, valued at $422,189,992, recovered in 1948. Value was computed at 21.7 cents a pound in 1948 and 19.7 cents in 1949, the yearly average weighted prices of all grades of refined copper sold by producers in the 2 years.

Rates of operations at plants engaged in the output of secondary copper products changed continually during 1949, decreasing during the first 7 months and increasing in the last 5. Total production from scrap for all sizes and types of plants, from primary refiners to foundries, was substantially less in 1949 than in 1948, but at the end of the year the general trend of activity was strongly upward.

Secondary copper recovered in the United States, 1948–49, in short tons

Secondary copper recovered		
Form of recovery	1948	1949
As unalloyed copper:		
At primary plants	245,376	212,392
At other plants	38,650	37,697
Total	284,026	250,089
In brass and bronze	653,281	436,457
In alloy iron and steel	2,911	1,552
In aluminum alloys	14,678	9,951
In other alloys	280	254
In chemical compounds	17,612	14,840
Total	688,762	463,054
Grand total	972,788	713,143

Recoverable copper content of scrap		
Kind of scrap processed	1948	1949
New scrap:		
Copper-base	458,892	323,666
Aluminum-base	7,231	5,293
Nickel-base	1,192	633
Lead-base	7	
Zinc-base	2	3
Total	467,324	329,595
Old scrap:		
Copper-base	500,872	381,491
Aluminum-base	3,831	1,450
Nickel-base	569	436
Lead-base	87	73
Tin-base	104	97
Zinc-base	1	1
Total	505,464	383,548
Grand total	972,788	713,143

Consumption of copper-base scrap dropped 393,220 tons owing to lowered demand; however, less scrap was available. Sources of military scrap shrank because the armed services held from the market part of their accumulations of munition scrap for conversion to ingot. There was less plant demolition aud ship breakage, which provide old scrap, and costs of handling and transporting scrap were higher than in 1948. Secondary smelters, brass mills, foundries, and other plants using both refined copper and scrap in 1949 consumed 31 percent less scrap but 23 percent less refined metal in that year than in 1948, an indication that more refined copper than scrap was available.

Secondary copper smelters produced 200,046 tons of brass ingot in 1949, about a third less than in 1948. Their output of other products

was 15,892 tons of refined copper including shot, 13,185 tons of copper billets, 15,826 tons of brass-mill billets, and 2,243 tons of copper powder and chemicals. The principal raw material used by these smelters is copper-base scrap of which they consumed 273,988 tons, including 70,422 tons of composition and 48,488 tons of yellow brass scrap. Of the total copper-base scrap consumed, 84 percent was recovered in the products mentioned; the remaining 16 percent represents melting loss.

Analysis and production of secondary copper and copper-alloy products in the United States, 1948–49

Item produced from scrap	Approximate analysis (percent)						Gross weight produced (short tons)	
	Cu	Sn	Pb	Zn	Ni	Al	1948	1949
Unalloyed copper products:								
Refined copper (electrolytic grade)	100						231,899	211,169
Casting copper	99						25,349	17,245
Copper sheet, rod, tubing, etc.	99						20,989	17,323
Copper powder	98						2,324	2,273

Copper in chemical products (content)							17,612	14,840

[1] Gross weight of brass and bronze ingot. Includes 234,696 tons of copper, 9,593 tons of lead, 528 tons of nickel, 8,335 tons of tin, 36,944 tons of zinc, 74 tons of aluminum, and 12,108 tons of primary metals in 1948; and 158,000 tons of copper, 6,364 tons of lead, 439 tons of nickel, 5,693 tons of tin, 25,665 tons of zinc, 64 tons of aluminum, and 3,821 tons of primary metals in 1949.

[2] Gross weight of secondary brass and bronze in commercial shapes. Includes 290,430 tons of copper, 3,052 tons of nickel, 4,137 tons of lead, 354 tons of tin, 118,338 tons of zinc, and 102 tons of aluminum in 1948; and 189,027 tons of copper, 2,187 tons of nickel, 3,053 tons of lead, 221 tons of tin, 70,800 tons of zinc, and 151 tons of aluminum in 1949.

[3] Gross weight of secondary metal in brass and bronze castings. Includes 107,828 tons of copper, 39 tons of nickel, 13,635 tons of lead, 5,441 tons of tin, 8,535 tons of zinc, and 119 tons of aluminum in 1948; and 78,059 tons of copper, 45 tons of nickel, 10,381 tons of lead, 4,045 tons of tin, 6,727 tons of zinc, and 162 tons of aluminum in 1949.

Output of secondary refined copper, including both electrolytic and casting grades, totaled 241,685 tons in 1949 compared with 275,846 tons in 1948. Of the totals primary producers made all but 29,293 and 30,470 tons, respectively. Their secondary production, which decreased less than that of any other group, also included 1,149 tons of copper sulfate (copper content). In addition to their secondary output, primary refiners produced 927,927 tons of copper in

1949 and 1,107,446 tons in 1948 from primary raw materials. Consumption of copper scrap by this group totaled 415,498 tons in 1949, indicating a recovery of 51 percent, which is low because 275,356 tons of the total consumed was low-grade material. Of the 16 primary smelters and refineries which consumed scrap in 1949, 11 were operated by companies owning mines that provided at least part of the ores and concentrates consumed, and 5 were operated on a custom basis only.

Secondary metal recovered from scrap by brass mills totaled 269,577 tons in 1949 compared with 417,603 tons in 1948, representing a decrease of 35 percent. The corresponding drop for copper refiners was 14 percent, for the secondary smelters 31 percent, and for the foundries and miscellaneous manufacturers 25 percent. To obtain their production the brass mills used 276,169 tons of scrap, of which all but a few hundred tons were copper-base, achieving a recovery of 98 percent, the highest recovery of any type of consumer.

Consumption of old and new copper scrap in the United States in 1949, gross weight in short tons

Scrap item	Remelters, smelters, and refiners		Manufacturers and foundries				Total scrap used
			Brass mills		Foundries and other manufacturers		
	New scrap	Old scrap	New scrap	Old scrap	New scrap	Old scrap	
No. 1 wire and heavy	[1] 30,232	[1] 48,732	14,634	325	2,096	12,801	108,820
No. 2 wire, mixed heavy, and light	[1] 38,806	[1] 87,724	24,021	3,607	1,716	8,152	164,026
Composition or red brass	30,652	39,770			8,137	16,406	94,965
Railroad-car boxes		220				48,742	48,962
Yellow brass	11,905	36,583	187,775	3,541	4,716	13,389	257,909
Cartridge cases	8	2,188	1,247	10,971	2	2,275	16,691
Auto radiators (unsweated)		19,981					19,981

Low brass	1,368	69	16,694	343	685	1,351	20,510
Aluminum bronze	34	391	72		194	879	1,570
Low-grade scrap and residues	[1] 85,046	[1] 231,126				2,088	318,260
Total	201,719	487,767	256,663	18,896	17,575	113,518	1,096,138

[1] Of the totals shown primary refiners reported the following: Unalloyed copper scrap, 65,027 tons of new and 75,115 tons of old; low-grade scrap and residues, 61,852 tons of new and 213,504 tons of old.

The wrought products made by the brass mills require raw materials of high purity to give them the strength for which they were designed. Brass mills and wire mills used 98 percent of the refined copper consumed; the former were the largest consumers of high-grade zinc. It has been estimated that about 70 percent of all brass made is produced by hot rolling. The use of high-grade zinc in brass for such production is essential.[2] It follows that the refined copper and scrap used must also be of high purity. For most brass-mill products lead is the major impurity. Even as little as 0.02 percent may render them hot-short. In addition to other raw materials, the brass mills used 632 tons of brass ingot, chiefly phosphor copper and copper iron

[2] Freeman, J. R., Jr., Outlook for Zinc in Brass Industry: Am. Metal Market, vol. 57, No. 70, Apr. 14, 1950, pp. 5, 7.

hardeners, the latter in manganese-bronze and aluminum-bronze products. Scrapped brass and bronze castings and process scrap from finishing the castings usually contain lead and so cannot be used by brass mills. Most scrap consumed by brass mills is processed scrap returned to them by fabricator customers. This source is augmented by purchases from dealers. When operations are at a high level the proportion furnished by dealers may range from a third to a half or more. When activity is reduced the percentage purchased from dealers declines. The average percentage of scrap, including home scrap and purchased, in casting-department charges is estimated at as high as 75 percent at one of the larger mills. In some products a greater percentage of scrap can be used than in others. Cartridge-brass charges can be 100 percent scrap cartridge cases if the latter are free of extraneous material, such as steel cases, and are otherwise of good quality. Free turning-rod brass charges can contain a high percentage of scrap because the product may contain up to 3 percent lead. No scrap of any kind is used in making copper wire, first, because only copper of highest purity is used and, second, because the wire bars from which the wire is drawn are not cast in the brass or wire mills but are purchased from refineries. Most of the copper wire used for transmission purposes is made in the wire mills. Some of the process scrap generated in brass mills consists of scalpings—the surface layer removed from tube and sheet at certain stages in the milling operations to preclude surface defects in the finished product. Ordinarily 2 or 3 percent of the material processed is removed in this way, but the percentage may be increased if surface defects increase in the end products.

Skimmings and other residues generated in brass mills are usually sold to smelters, but at least one of the larger mills operates a scrap reclamation plant in which magnetic pulleys, screens, rolls, concentrating tables, cone classifiers, and other equipment are used to extract as much of the metallics as possible from the residues, either as concentrates or metal, some of which can then be used without refining. Since the scrap used by the brass mills is of such high quality, their recovery of secondary metal is better than that of any other type of plant using copper-base scrap.

An important installation, completed in 1949, was Scovill Manufacturing Co.'s new strip mill in which casting is continuous. The chief advantages over previous procedure are melt-to-melt chemical uniformity, avoidance of segregation in ingots cast, and savings in labor.[3]

A recent development in copper alloys is the addition of 0.5 percent tellurium to copper to improve machinability.[4] Based on a rating of 100 for free cutting brass the machinability of the tellurium alloy is 90 and that of copper 20. Selenium may be used in this alloy in place of tellurium. Another new copper alloy, developed at Battelle Memorial Institute and sponsored by the United States Army Signal Corps, is composed of 6.5 percent silver and 93.5 percent copper.[5] It has over 70 percent of the conductivity of copper and high tensile

[5] Hodge, Webster, and Rose, Kenneth, New Copper-Base Alloys Combine High Strength with High Conductivity: Materials and Methods, vol. 31, No. 1, January 1950, pp. 64, 65, 72.

strength of the order of 160,000 pounds per square inch, a combination that satisfies a wartime need.

The accompanying table illustrates the relative importance of scrap in comparison with other copper raw materials in the operations of the principal consumers. If the recovery factors for the different groups, as given in preceding pages of this section, are applied to the scrap-consumption figures and the items for each column then added, a close approximation of the copper-product output of each group will be obtained because the melting loss in consumption of the refined metals is small. Thus, the brass-mill production from copper-base scrap is 98 percent of 275,559 or about 270,000 tons. By adding to this the other figures in the brass-mill column a total output of 829,350 tons is obtained. According to figures recently published,[6] shipments of brass-mill products totaled 771,087 tons. This figure applies to operations of members of the Copper & Brass Research Association and certain other contributors of data.

Consumption of copper and brass materials in 1949, by principal consuming groups, in short tons

Item consumed	Primary producers	Brass mills	Wire mills	Foundries and miscellaneous	Secondary smelters
Copper-base scrap	415,498	275,559		131,093	273,987
Primary material	[1] 927,927				
Refined copper		478,126	677,223	21,808	4,463
Brass ingot		632	2,204	201,339	
Slab zinc		79,624			
Miscellaneous		968			9,015

[1] Recoverable copper content; gross weight not available.

Foundries use nearly all of the brass ingot produced by the secondary smelters and in addition some scrap and refined copper. In 1949 they used 111,980 tons of copper-base scrap, recovering 106,060 tons of secondary metal, or 95 percent, mostly in the form of castings. There are 64 brass-ingot makers, which supply the ingot needs of about 3,000 foundries, most of which are small plants. Their equipment usually is adapted only to simple remelting, so that the scrap used must be metallic rather than residues such as can be accommodated in the furnaces of the smelters. For this reason melting losses of foundries are less than those of the smelters and refiners. The most important scrap items for both custom brass foundries and secondary copper smelters are No. 1 Composition and yellow brass. The accompanying scrap-consumption table shows the most important item is railroad-car boxes of which 48,742 tons were consumed by foundries in 1949 and 62,807 tons in 1948; the plants using most of this type of scrap were foundries owned by railroads or bearing manufacturers.

Reported consumption of brass ingot in 1949 totaled 165,024 short tons compared with 229,620 tons in 1948. Brass and aluminum foundries were the principal consumers; these foundries and a few miscellaneous manufacturers used 162,188 tons of the total. Brass and wire mills used 2,836 tons, and 794 tons were exported in 1949

[6] American Bureau of Metal Statistics, 1949 Yearbook: New York, 1949, p. 27

compared with 4,322 tons and 424 tons, respectively, in 1948. Producers shipped 204,969 tons of brass ingot in 1949 and 302,910 tons in 1948. Assuming that shipments equal domestic consumption plus exports, this consumption survey achieved 81 percent coverage in 1949 compared with 76 percent in 1948. Over 3,300 plants were canvassed each year.

In the accompanying table the ingot consumption has been classified under nine general types and by regions formed by nine groupings of States according to the customary practice in preparing these statistics for the Minerals Yearbook. As in 1948, the region including Ohio and Illinois consumed more than any other—74,412 tons—and Ohio used more than any other State—26,090 tons. The region using the next largest total, 42,643 tons, was the Middle Atlantic in which the New York metropolitan area lies. These two regions together consumed 72 percent of the total quantity used by foundries. Consumption of composition ingot, the largest item, amounted to 93,907 tons or 58 percent of the total.

Foundry consumption of brass ingot in 1949, by States, in short tons

States	Tin bronze	Leaded tin bronze	Leaded red brass	High leaded tin bronze	Leaded yellow brass	Manganese bronze	Hardeners	Nickel silver	Low brass	Total

All classes of consumers decreased their holdings of copper-base scrap in 1949. In November and December secondary smelters were operating with less than 30 days' supply on hand.

Consumers' stocks of copper-base scrap in the United States at end of year, 1948–49, gross weight in short tons

Scrap item	Dec. 31, 1948	Dec. 31, 1949
Unalloyed copper	15,241	12,937
Copper-base alloy	59,924	46,011
Low-grade scrap and residues	47,574	34,999
Total	122,739	93,947

Dealers' buying prices for No. 1 Composition scrap declined from 14.52 cents a pound in January to 8.18 cents in June, then increased to 11.18 cents in November, and finished the year at 10.93 cents, the average for the year being 10.35 cents. They started to drop several months before the first decrease of the year in the price of copper, and scrap prices began to recover about a month before the price of copper began to rise again. Prices for No. 1 Heavy copper scrap followed the same pattern as those of composition type, falling from 18.75 cents a pound in January to 10.80 cents in June, then increasing to 13.41 cents in December. The average for the year was 13.85 cents.

Brass and copper scrap imported into and exported from the United States, 1945–49, in short tons

	1945	1946	1947	1948	1949

Scrap copper	133	909	969	2,266	8,284

SECONDARY LEAD

Lead recovery in the secondary lead industry decreased in 1949 for the second successive year, totaling 412,183 tons valued at $130,249,828 compared with 500,071 tons valued at $179,025,418 reclaimed in 1948, a decrease of 18 percent in quantity and 27 percent in value. The value of production for both years was computed on the basis of the yearly average weighted price of all grades of refined lead sold by producers, which was 17.9 cents per pound in 1948 and 15.8 cents in 1949. Recovery of lead from scrap, as metal and in alloys, did not exceed production of refined primary lead from domestic ores and base bullion as it had in the preceding 4 years but was greater than domestic mine production for the fourth successive year.

Secondary lead recovered in the United States, 1948–49, in short tons

Secondary lead recovered			Recoverable lead content of scrap		
Form of recovery	1948	1949	Kind of scrap processed	1948	1949
As metal:			New scrap:		
At primary plants	4,952	23,230	Lead-base	59,618	42,930
At other plants	126,951	129,396	Copper-base	7,720	5,113
Total	131,903	152,626	Total	67,338	48,043
In antimonial lead [1]	243,552	172,742	Old scrap:		
In other lead alloys	102,603	78,894	Battery lead plates	256,193	210,611
In copper-base alloys	21,499	7,440	All other lead-base	156,019	138,768
In tin-base alloys	514	481	Copper-base	20,497	14,738
			Tin-base	24	23
Total	368,168	259,557	Total	432,733	364,140
Grand total	500,071	412,183	Grand total	500,071	412,183

[1] Includes 49,525 tons of lead recovered in antimonial lead from secondary sources at primary plants in 1948 and 32,705 tons in 1949.

For the fifth consecutive year more scrap went into the production of refined soft lead and less into antimonial lead. Production of refined soft lead by secondary smelters and primary plants that used scrap metal in addition to ores, concentrates, and base bullion increased 16 percent—from 135,071 tons in 1948 to 156,910 tons in 1949—the secondary lead content being 131,903 and 152,626 tons, respectively. The secondary lead content of antimonial lead produced fell from 243,552 to 172,742 tons, a decrease of 29 percent. Secondary lead recovered in solder decreased for the first time in 4 years, and lead reclaimed in type metals declined for the third successive year. Recovery in lead-base babbitt dropped 36 percent. Total output of secondary lead and tin products was 17 percent lower than in

1948, less refined metal as well as less scrap metal being used in these products. Secondary smelters consumed 49,483 tons of primary lead, 9,953 tons of primary tin, 4,269 tons of primary antimony, and 2,731 tons of other materials as alloying ingredients with scrap in making specification alloys in 1949, compared with 52,760 tons, 17,649 tons, 6,697 tons, and 3,159 tons, respectively, in 1948.

Primary lead refineries recovered 14 percent or 56,852 tons of the total secondary lead recovered in 1949, in addition to 477,338 tons of refined lead produced from ores, concentrates, and base bullion. Of the 56,852 tons reclaimed from secondary material 23,230 tons were in refined lead, 32,705 tons in antimonial lead, and 917 tons in solder. The antimonial lead contained 3,385 tons of antimony, of which 1,775 tons came from scrap and 1,610 tons was added as primary metal. Primary plants also recovered 465 tons of tin from scrap metal, all in solder.

Secondary smelters and manufacturers recovered 86 percent of the total secondary lead produced in 1949, 98 percent of the secondary tin, and 90 percent of the secondary antimony. In comparison, 68 percent of the total secondary aluminum and 70 percent of the total secondary copper were recovered by plants other than primary producers and primary refineries. Comparison of data presented in the different sections of this chapter also indicates that the ratio of secondary lead recovered to primary lead produced was greater than the corresponding ratios for aluminum, copper, and zinc. In other words, the secondary lead recovered was greater in proportion to the total quantity of lead produced, both primary and secondary, than for secondary aluminum, copper, and zinc.

Shipments [1] of secondary lead, tin, and lead- and tin-alloy products in the United States in 1949, gross weight in short tons

Product	Gross weight of product [2]	Secondary metal content			
		Lead	Tin	Antimony	Copper
Refined pig lead	120,694	120,694			
Remelt lead	35,002	31,518

Tin content of chemical products	608		608		

[1] Most of the figures herein represent shipments rather than production of the items involved. However, it has been necessary to record actual production figures in some instances.
[2] Difference between gross weight of products and secondary metal content represents added primary metals or impurity content.

Of the 412,183 tons of lead reclaimed in 1949, 392,332 tons were recovered from lead- and tin-base scrap, the remainder of 19,851 tons coming from copper-base scrap. A total of 1,284 tons of lead in lead- and tin-base scrap was added to brass and bronze to bring total recovery of secondary lead in copper-base alloys to 7,440 tons. Manufacturers and foundries recovered 97 percent of the lead scrap they consumed, and the primary and secondary smelters reclaimed 77 percent of the scrap metal treated. The former group consumed 11 tons of battery-lead plate scrap, whereas the smelters used 316,031 tons. Recovery of metal from this material is comparatively low—about 70 percent of the quantity consumed compared with 99 percent from soft lead scrap.

Consumption of old and new lead scrap in the United States in 1949, gross weight in short tons

Scrap item	Remelters, smelters, and refiners		Manufacturers and foundries		Total scrap used
	New scrap	Old scrap	New scrap	Old scrap	
Soft lead		50,639	7	1,552	52,198
Hard lead		13,037		564	13,601
Cable lead		40,818		53	40,871
Battery-lead plates		316,031		11	316,042
Mixed common babbitt		7,067	29	11,166	18,262
Solder and tinny lead		11,738	1,173	267	13,178
Type metals		14,515		53	14,568
Dross and residues	68,620			1	68,621
Total	68,620	453,845	1,209	13,667	537,341

A total of 537,341 tons of lead-base scrap was treated in 1949. This quantity was 17 percent under the 643,560 tons used in 1948 and 20 percent under the 671,282 tons consumed in the peak year of 1947. Treatment of battery-lead plates decreased 68,389 tons (18 percent), soft lead 18,984 tons (27 percent), antimonial lead 7,350 tons (35 percent), common babbitt 1,494 tons (8 percent), type metals 2,962 tons (17 percent), and drosses and residues 19,377 tons (22 percent). Increases in use of scrap over 1948 were 33 percent in the use of cable lead and 20 percent in solder scrap. Smelters' highest operations of the year were in January, September, and March in the order listed and the lowest in July.

In 1949 the market in lead was unstable. Smelting charges per ton on battery plates had dropped to nothing near the end of 1948, advanced to a quoted $140 in March, gradually declined to $40 in July, rose again to $100 by October 1, and fell to $50 at the end of the year. A second mild winter cut the demand for replacement batteries and lessened manufacturers' demand for lead, and a shortage of copper due to strikes cut cable makers' demand for lead for cable covering.

Percentage and remelt metals circulated among remelters, smelters, and refiners in 1949 totaled 34,198 short tons consisting of 3,700 tons of solder, 2,718 tons of lead-base babbitt, 9,638 tons of soft lead, 15,048 tons of antimonial lead, 1,389 tons of type metals, 1,118 tons of cable lead, 472 tons of tin-base babbitt, 98 tons of remelt tin, and 17 tons of pewter.

Because of the downward trend in the lead market, smelters did not favor purchasing or holding large stocks of scrap but cut inventories during the year 34 percent—from 70,984 to 46,754 tons. Stocks of unalloyed lead were 19 percent higher on December 31, but lead-base alloy scrap dropped 47 percent and drosses and residues 11 percent. Smelters' stocks of secondary pig metals also decreased during the year from 29,900 to 27,053 tons.

Consumers' stocks of lead-base scrap in the United States at end of year, 1948–49, gross weight in short tons

Scrap item	Dec. 31, 1948	Dec. 31, 1949
Unalloyed lead	3,124	3,713
Lead-base alloy	47,952	25,280
Drosses and residues	19,908	17,761
Total	70,984	46,754

The price of primary lead remained at the peak of 21.5 cents a pound the first 2 months of the year and then steadily dropped until it reached 12.00 cents on May 26. On July 8 it increased to 13 cents and continued upward until August 18, when it reached 15.125 cents a pound. During this period the price changed nearly every day and so rapidly as to outnumber variations in scrap-lead prices, which are usually more sensitive than primary prices. On September 26 the price declined again to 14.75 cents and continued downward until it reached 12 cents on November 21, where it remained the rest of the year. Monthly averages of dealers' buying prices for heavy scrap lead in New York followed about the same pattern as prices of refined lead. The highest was 18.75 cents a pound in January; the average declined to 7.48 cents in June, then rose to 11.40 cents in August, and dropped to 9.16 cents in December. The average for the year was 10.91 cents.

General imports of lead scrap totaled 14,649 tons (lead content) in 1949 compared with 28,897 tons revised (lead content) in 1948.

SECONDARY MAGNESIUM

Secondary magnesium (including alloying ingredients) recovered from scrap in 1949 totaled 5,962 short tons valued at $2,444,420 compared with 7,553 (revised) short tons valued at $3,096,730 (revised) in 1948. Values were calculated for both years at 20.5 cents a pound, which had been the price of magnesium since January 1943. Primary production in 1949 was 11,598 tons, all from operations at the Freeport, Tex., plant of Dow Chemical Co. Consumption of primary magnesium, including pure magnesium and magnesium content of primary alloy, totaled 11,947 tons compared with 9,698 (revised) tons in 1948.

Secondary magnesium recovered in aluminum alloys was 29 percent of that so reclaimed in 1948, because of decreased consumption of aircraft scrap; that in magnesium castings was about half the quantity recovered in 1948. Recovery from scrap made into anodes for cathodic protection was 105 tons greater in 1949 than in 1948.

Although recovery of secondary magnesium in magnesium alloy ingot decreased 10 percent, its ratio to total secondary recovery increased from 62 percent in 1948 to 71 percent in 1949.

Secondary magnesium recovered in the United States, 1948–49, in short tons

Secondary magnesium recovered			Recoverable magnesium-alloy content of scrap		
Form of recovery	1948	1949	Kind of scrap processed	1948	1949
Magnesium-alloy ingot [1] (gross weight)	[2] 4,713	4,249	New scrap: Magnesium-base	[2] 3,365	3,023
Magnesium-alloy castings (gross weight)	1,301	681	Old scrap:		
Magnesium-alloy shapes	1	96	Magnesium-base	[2] 3,771	2,837
In aluminum alloys	[2] 998	294	Aluminum-base	417	102
In zinc alloys	6	4			
Chemical and other destructive uses	84	83	Total	[2] 4,188	2,939
Cathodic protection	450	555			
Grand total	[2] 7,553	5,962	Grand total	[2] 7,553	5,962

[1] Figures include secondary magnesium incorporated in primary magnesium ingot.
[2] Corrected figure.

Of the total quantity of magnesium recovered in secondary magnesium alloy ingot 2,278 tons were secondary ingot and 1,971 tons were incorporated in primary ingot. Consumption of secondary ingot, not including that incorporated in primary ingot, which cannot be measured, totaled 3,809 tons, including 1,502 tons in castings; 359 tons in ribbon, stick, and powder; 1,861 tons in aluminum alloys; 74 tons for cathodic protection; and 13 tons for miscellaneous uses.

Total consumption of magnesium scrap in 1949 was 6,458 tons, 18 percent less than in 1948, although use of primary magnesium, primary magnesium alloy, and secondary magnesium ingot increased. Old scrap constituted 48 percent of the total used in 1949 as compared with 52 (revised) percent in 1948. The price of remelt magnesium ingot was unchanged at 18 to 18.5 cents a pound (carlots) throughout 1949.

Stocks and consumption of magnesium scrap in the United States in 1949, gross weight in short tons

Scrap item	Stocks		Consumption during 1949
	Dec. 31, 1948	Dec. 31, 1949	
Cast scrap	[1] 2,654	2,113	3,426
Solid wrought scrap	898	737	2,776
Borings, grindings, drosses, etc	45	27	256
Total	[1] 3,597	2,877	6,458

[1] Corrected figure.

Magnesium scrap, as well as primary magnesium, primary magnesium alloy, and secondary magnesium alloy ingot, is used chiefly in the plants of the single primary magnesium producer, the primary aluminum producers, and a few other primary plants that also do most of the magnesium casting and rolling. Only three secondary smelters consumed important quantities of magnesium materials. The situation is different in other nonferrous metal operations. Scrap aluminum, copper, lead, tin, and zinc is consumed in numerous secondary plants not operated by primary producers, although the latter do use some scrap. In such circumstances magnesium scrap is less important to its consumers than other nonferrous scrap to its consumers, the secondary smelters, and other users.

Magnesium chips and turnings were reported to have been experimentally extruded as wire having a tensile strength of 42,500 pounds per square inch as compared with 39,500 for wire extruded from solid metal.[7] The composition of the alloy used was 94 percent magnesium and 6 percent aluminum. In other extrusion experiments powdered alloys of magnesium, aluminum, and zirconium were used in which the zirconium was precipitated to harden the matrix.

SECONDARY NICKEL

The recovery of secondary nickel from nonferrous scrap in 1949 totaled 5,680 short tons valued at $4,877,984, a decrease of 36 percent in quantity from the 8,850 tons valued at $6,966,720 recovered in 1948. The total value was calculated at 42.94 cents a pound in 1949 and 39.36 cents in 1948, the average spot-delivery prices of Grade F nickel ingots and shot in 10,000-pound lots at New York. The recovery declined because output of all the products in which nickel-bearing scrap is used decreased. Most of the recovery from copper-base nickel-bearing scrap and a large part of that from nickel-base alloy scrap was in the copper alloys nickel silver and cupro nickel. More nickel was recovered in brass-mill shapes than in any other product—2,187 tons in 1949 and 3,052 tons in 1948. Nickel recovered from nickel-base scrap amounted to 2,569 tons in 1949 compared with 4,516 tons in 1948 and from copper-base scrap, 2,440 tons in 1949 and 3,442 tons in 1948. Of the 1,201 tons of secondary nickel recovered in iron and steel in 1949, 1,060 tons were obtained from Monel metal scrap and the remainder from unalloyed nickel scrap. Aside from that obtained from scrap, the only production of nickel in the United States was as a byproduct from copper refining.

[7] Busk, R. S., and Leontis, T. E., Powdered Magnesium Alloys: Jour. of Metals, vol. 188, No. 2, February 1950, pp. 297-306.

Secondary nickel (nonferrous) recovered in the United States, 1948–49, in short tons

Secondary nickel recovered			Recoverable nickel content of scrap		
Form of recovery	1948	1949	Kind of scrap processed	1948	1949
As metal	99	46	New scrap:		
In nickel-base alloys	1,850	1,062	Nickel-base	2,581	1,335
In copper-base alloys	3,467	2,438	Copper-base	2,875	1,958
In aluminum-base alloys	889	668	Aluminum-base	488	473
In lead-base alloys	6	21			
In cast iron and steel [1]	2,304	1,201	Total	5,944	3,766
In chemical compounds	235	244			
			Old scrap:		
Grand total	8,850	5,680	Nickel-base	1,935	1,234
			Copper-base	567	482
			Aluminum-base	398	193
			Lead-base	6	5
			Total	2,906	1,914
			Grand total	8,850	5,680

[1] Includes only nonferrous nickel scrap added to cast iron and steel.

Consumption of nickel scrap totaled 18,160 tons in 1949 compared with 26,688 tons in 1948. The chief nickel-bearing scrap items are nickel silver, which is copper-base material and Monel metal; 14,286 tons of nickel silver, from which most secondary nickel is obtained, was used in 1949 compared with 20,145 tons in 1948. Consumption of Monel scrap decreased from 5,014 tons in 1948 to 3,003 tons in 1949. Monel is a nickel-copper alloy that contains 67 percent nickel and 30 percent copper; the remainder is mostly iron and manganese. It is obtained by roasting copper-nickel converter matte and reducing the resulting oxide to metal with charcoal.[8] Compositions of other Monel-metal types in commercial use vary a little from that given. Much stainless steel contains nickel; the 87,694 tons of stainless-steel scrap consumed in[9] 1949 probably contained several thousand tons, but tabulation of the secondary nickel recovered in the steel to which this scrap was added would be difficult because of the varying nickel content of the numerous types of stainless-steel scrap used.

Consumption of old and new nickel scrap in the United States in 1949, gross weight in short tons

Scrap item	Remelters, smelters, and refiners		Manufacturers and foundries		Total scrap used
	New scrap	Old scrap	New scrap	Old scrap	
Unalloyed nickel	91	196	22	101	410
Monel metal	221	913	1,510	359	3,003

[1] Copper base scrap, so tabulated, except in this table.

[8] Wickenden, T. H., The Nickel Industry: Metals Handbook, 1948 ed., pp. 1025–1027.
[9] Melcher, Norwood B., and Larkin, James E., United States Bureau of Mines Iron and Steel Report: No. 110, December 1949, p. 2.

According to the American Metal Market the spot-delivery price of Grade F nickel ingots and shot in 10,000-pound lots at New York was 42.90 cents a pound at the beginning of 1949 and 42.97 cents at the end; the average for the year was 42.94 cents. The change was caused by increases in freight rates. Scrap-metal dealers' buying prices at New York at the beginning of 1949 were quoted at 21 cents a pound for nickel sheet and clippings and 16 cents for Monel-metal clippings. Although the price of primary nickel increased slightly during the year, nickel scrap prices declined. The price of nickel sheet and clippings dropped to 18 cents on June 20 and that of Monel clippings to 14 cents on April 5 and to 12 cents on June 20, after which the prices remained unchanged to the end of the year.

No imports of nickel scrap were reported in 1948 or 1949, but exports in 1949 totaled 2,784 tons compared with 5,826 tons in 1948 and 8,424 tons in 1947.

Consumers' stocks of nonferrous nickel scrap [1] in the United States at end of year, 1948–49, gross weight in short tons

Scrap item	Dec. 31, 1948	Dec. 31, 1949
Unalloyed nickel	261	139
Nonferrous nickel alloys	2,758	2,866
Nickel residues	2,262	104
Total	5,281	3,109

[1] Includes nickel-silver scrap.

SECONDARY TIN

Recovery of secondary tin from scrap in 1949 totaled 24,901 short tons valued at $49,461,354 compared with 30,124 tons valued at $59,796,140 reclaimed in 1948. All of the secondary tin produced in 1949, except 465 tons recovered by primary lead refineries, was reclaimed by secondary smelters, detinners, manufacturers, and foundries. All but a small percentage of the refined tin from ores and concentrates smelted in the United States was produced by the Government-owned smelter at Texas City; the output of which was 40,379 short tons.

The tin-recovery table is double, as are those in the sections devoted to the other nonferrous secondary metals. It shows secondary tin recovered according to composition on the left and according to class of scrap processed on the right side. The data on the left side are compiled from individual plant outputs and those on the right by calculating the tin that could be recovered from the quantities of the different kinds of scrap reported used. The totals so derived for each side of the table do not agree because of slight errors introduced by the necessity of assuming recovery factors. As presented here, however, the items have been adjusted to give the exact balance theoretically expected. The word "recovery" thus may be applied to both sides of the table.

Secondary tin recovered in the United States, 1948–49, in short tons

Secondary tin recovered		
Form of recovery	1948	1949
As metal:		
At detinning plants	3,304	3,265
At other plants	204	287
Total	3,508	3,552
In solder	7,404	7,762
In tin babbitt	1,040	1,084
In chemical compounds	580	608
In lead-base alloys	4,810	3,463
In brass and bronze	12,782	8,432
Total	26,616	21,349
Grand total	30,124	24,901

Recoverable tin content of scrap		
Kind of scrap processed	1948	1949
New scrap:		
Tin plate	3,561	3,543
Tin-base	1,281	854
Lead-base	1,970	1,926
Copper-base	3,222	2,055
Total	10,034	8,378
Old scrap:		
Tin cans	106	111
Tin-base	3,346	2,976
Lead-base	5,349	5,592
Copper-base	11,289	7,844
Total	20,090	16,523
Grand total	30,124	24,901

Detinning plants produced 3,195 tons of pig tin from old tin cans and new tin-plate clippings and 70 tons from tin-base scrap and residues; in addition, secondary smelters recovered 287 tons of pig tin. The total of 3,552 tons of unalloyed tin reclaimed from scrap was 1 percent above the quantity recovered in 1948. Recovery of all secondary tin, as metal, in alloys, and in compounds, decreased 17 percent. Increased recovery in solder, tin babbitt, and chemical compounds was overbalanced by a 28-percent decline in lead-base alloys and a 34-percent drop in brass and bronze. Shipments of secondary tin and lead-tin alloys are presented in the Lead section of this chapter. In addition to metallic products, secondary smelters produced, from lead- and tin-base scrap, tin salts with a recoverable tin content of 83 tons in 1949. These chemicals, sodium stannate and tin tetrachloride, were shipped to detinning plants for further treatment.

Consumption of tin-base scrap decreased 20 percent in 1949; less of all types of scrap except pewter were consumed. Use of block-tin pipe and high-tin babbitt dropped 18 and 8 percent, respectively, below the quantity treated in 1948.

Consumption of old and new tin scrap in the United States in 1949, gross weight in short tons

Scrap item	Remelters, smelters, and refiners		Manufacturers and foundries		Total scrap used
	New scrap	Old scrap	New scrap	Old scrap	
Block-tin pipe, scrap, and foil		819	8	61	888
Tin scruff and dross	1,380		3		1,383
No. 1 pewter		143			143
High-tin babbitt		2,271		96	2,367
Residues	36			4	40
Total	1,416	3,233	11	161	4,821

The price of primary tin held steadily at $1.03 a pound until September 28, when it dropped to 96 cents. There were nine additional decreases during the last 3 months, and on December 31 the Reconstruction Finance Corporation selling price, New York, was 77.50 cents.

General Preference Order M-43, controlling the distribution and use of secondary as well as primary tin, was extended for another year on June 30. However, on August 25, when it appeared that supplies were adequate to meet the needs of industry and the strategic stockpile, restrictions on end use were abolished, while allocation controls continued.

As in 1948, tin-base scrap exports exceeded domestic consumption, totaling 10,332 short tons in 1949 and 8,813 in 1948. They were largely drosses and residues containing a number of metals including tin—the element of greatest value—and were consigned chiefly to Capper Pass & Son plants in England, which have specialized in treating such material for many years.

Consumers' stocks of tin-base scrap in the United States at end of year, 1948–49, gross weight in short tons

Scrap item	Dec. 31, 1948	Dec. 31, 1949
Unalloyed tin	121	35
Tin-base alloys	585	746
Drosses and residues	615	512
Total	1,321	1,293

Smelters' total stocks of tin scrap, which had gained 25 percent in 1948, remained almost unchanged in 1949. The 2-percent decrease was in unalloyed tin and the drosses, but stocks of tin-base alloys increased 28 percent. Dealers' buying price for scrap block-tin pipe dropped eight times from 83.50 cents a pound on January 1 to 64 cents in December, the average for the year being 74.08 cents.

Detinning Plants.—Eight detinning plants reported recovery operations in 1948: Johnston & Jennings Co., Cleveland, Ohio; Metal & Thermit Corp., South San Francisco, Calif., East Chicago, Ind., and Carteret, N. J.; Standard Metal Refining Co., Baltimore, Md.; Vulcan Detinning Co., Sewaren, N. J., Neville Island, Pittsburgh, Pa.; and Tin & Chemical Corp., Baltimore, Md.

[1] Includes a small tonnage of pig tin of less than standard purity and, consequently, subject to further refining or alloying.
[2] Recovery from tin-plate clippings and old containers only. In addition, detinners recovered 20 tons of tin as metal and 107 tons of tin in compounds from tin-base scrap and residues in 1948 and 144 tons of tin as metal and in compounds from these sources in 1949.

Secondary tin recovered by detinning plants, as metal and in chemical compounds, was virtually unchanged in 1949. The total tin recovered was 3,798 short tons in 1949 and 3,794 in 1948. Tin-plate clippings and old cans were the source of 3,654 tons in 1949, of which 3,195 was reclaimed as metal in the form of pigs and 459 tons in the form of tin compounds. During 1948 such material provided 3,667 tons comprising 3,284 tons of metal and 383 tons in compounds. The treatment of other tin-bearing materials accounts for the remaining production of 144 tons in 1949 and 127 in 1948.

The industry reported treating 387,468 long tons of tin-plate clippings in 1949. This was the largest on record, and exceeded the previous peak reached in 1948 by nearly 3 percent. The earlier peak year of 1941 was exceeded by 14 percent. The average cost of such clippings delivered at plants decreased from $37.48 a long ton in 1948 to $25.21 in 1949, responding to a proportional reduction in the price of No. 1 Heavy-Melting steel scrap. Old cans processed increased 2 percent to 15,382 long tons in 1949, compared with 15,079 tons in 1948 and the record of 175,870 tons in 1943. Tin recovered from tin-plate clippings in 1949 totaled 3,543 short tons, slightly less than in 1948; while that from old cans—111 tons (mostly in the form of pig tin)—increased 5 percent.

The average quantity of tin recovered per long ton of tin-plate scrap treated was 18.29 pounds in 1949 against 18.91 pounds in 1948. Before the introduction of electrolytic tin plate and wartime restrictions on the weight of tin on the hot-dipped product recoveries averaged around 37 pounds per ton of material detinned. Lower recoveries per unit for the most part reflect the treatment of a larger proportion of electrolytic tin plate carrying a much thinner coating of tin than the heavier coated hot-dipped product. The use of electrolytic tin plate has been expanding in the manufacture of cans (both

general line and packers' or sanitary) and closures. The average quantity of tin recovered per long ton of old tin-coated containers used increased to 14.43 pounds in 1949, compared with 14.10 pounds in 1948, but was considerably below the 22.58 pounds recorded for 1943.

Imports of tin-plate scrap were 41,028 long tons in 1949 against 41,084 in 1948 (detinned, this material would provide the equivalent of about 400 tons of tin). No exports of tin-plate scrap were recorded for 1948 and 1949.

SECONDARY ZINC

Secondary zinc recovered in 1949 from purchased scrap and residues totaled 237,813 short tons, with a value of $58,977,624, calculated at 12.4 cents a pound, the yearly average weighted price of all grades of refined zinc sold by producers. This tonnage was 27 percent lower than in 1948, when 324,639 tons with a value of $86,353,974 at 13.3 cents a pound were recovered. Output of primary slab zinc in 1949 totaled 814,782 tons compared with 787,764 tons in 1948.

Secondary zinc recovered [1] in the United States, 1948–49, in short tons

Secondary zinc recovered			Recoverable zinc content of scrap

[1] Zinc content.
[2] Revised figure.

Recovery of zinc from copper-base scrap declined 37 percent in 1949 because of decreased copper-base scrap consumption. Much of the 17-percent decrease in recovery of zinc from zinc-base scrap can be attributed to lower consumption of slab zinc in galvanizing and to still lower generation of scrap in galvanizing operations. In years such as 1949, when there was no oversupply of scrap material, consumption varies with availability. Galvanizers' dross, the chief zinc-scrap item, forms in galvanizing pots as the result of the attack of the molten zinc on articles galvanized and on the walls of the pots. In the continuous galvanizing process, use of which has been increasing since the end of World War II, less dross is formed than when the ordinary hot-dip galvanizing method is used. The temperature and composi-

tion of the molten zinc bath can be better controlled when the continuous process is used. It was reported early in 1950 that seven continuous lines were then in operation and three more were under construction.[10] Installation costs are said to be high, but labor savings and improvement in quality of product are compensating factors. Advantages claimed for an induction galvanizing furnace, placed on the market in 1949, were reduced dross formation and longer life on account of its refractory lining. About 5 percent of all galvanizing in 1949 was done by electrical methods.

In intervals between wars the proportion of slab zinc used in brass and bronze tends to decrease and that used in galvanizing to increase; this tendency is reflected in quantities of zinc recovered from different types of scrap. Recovery of zinc from copper-base scrap represented 42 percent of the total secondary recovery in 1949 as compared with 49 percent in 1948.

Secondary zinc reclaimed in brass and bronze, most of which came from brass scrap, was 35 percent less than in 1948. The total recovered as redistilled slab, in zinc dust, remelt zinc, and zinc-base alloys dropped 17 percent. Recovery in chemical products declined 24 percent chiefly because of reduction in the quantity of secondary lithopone produced.

The total number of producers of zinc dust and redistilled slab was 25 in 1949 as compared with 23 in 1948. Several plants that distilled zinc scrap in 1948 did not do so in 1949 and vice versa. Most zinc dust is made from scrap, but one plant made this product entirely from primary material in 1949. There were 5 plants that made both zinc dust and redistilled slab, 6 that made zinc dust only, and 14 that made slab only. Of the plants that reported using scrap in distillation operations 9 used chiefly primary raw materials, whereas the other 16 were classed as secondary plants.

Production of secondary zinc and zinc-alloy products in the United States, 1945–49, gross weight in short tons

Products	1945	1946	1947	1948	1949
Redistilled slab zinc	49,240	44,516	59,542	[1] 62,320	55,041
Zinc dust	23,892	26,002	28,334	29,932	21,243
Remelt spelter [2]	8,090	8,212	7,443	7,796	6,045

[1] Revised figure.
[2] Contains small tonnages of bars, anodes, etc.

Total zinc-base scrap consumption decreased 18 percent in 1949. The only increase was 12 percent in use of scrap die castings. Aluminum and zinc die castings compete in many fields, especially in the automobile industry. Data published by the Bureau of the

[10] White, F. G., Developments in Galvanizing: Am. Metal Market, vol. 57, No. 68, Apr. 12, 1950, p. 9.

Census in Facts for Industry bulletins indicate that shipments of aluminum die castings decreased 26 percent in 1949. Reports to the Bureau of Mines reveal that consumption of slab zinc in die castings decreased 14 percent in the same period, indicating a gain for zinc over aluminum.

Consumption of old and new zinc scrap in the United States in 1949, gross weight in short tons

Scrap item	Remelters, smelters, and refiners		Manufacturers and foundries		Total scrap used
	New scrap	Old scrap	New scrap	Old scrap	
Clippings	3,737		3,925		7,662
Sheet and strip		4,333		101	4,434
Engravers' plates		1,304		87	1,391
Skimmings and ashes	47,154		28,616		75,770
Dross	55,258		3		55,261
Die castings		22,789	611	329	23,729
Rod and die scrap		1,712			1,712
Flue dust	5,129		8,831		13,960
Chemical residues	10,530		6,428		16,958
Total	121,808	30,138	48,414	517	200,877

Manufacturers and foundries consumed a total of 48,931 tons of zinc scrap in 1949, of which 5,053 tons were metallic scrap and 43,878 tons byproduct residues. Foundries consume very little zinc scrap. Most of the metallic scrap was used by die casters, brass mills, galvanizers, and zinc rolling mills. The residues were consumed by chemical plants. The zinc in these materials is chiefly in oxide or chloride form, easily soluble, or already in the chemical combination desired. Zinc oxide can be produced by chemical processes as in the manufacture of sodium hydrosulfite or in smelting operations such as roasting metallic zinc scrap or zinc ore. More zinc oxide is made from primary materials rather than from scrap, but the other zinc chemicals, except lithopone, are made chiefly from scrap and residues.

Smelters recovered 71 percent, and manufacturers and foundries 61 percent of the zinc contained in the scrap treated. These recoveries are relatively low, not because of inefficient operation of plants but because so much of the scrap treated was byproduct residues containing a low proportion of zinc. Chemical plants reclaim virtually all of the zinc contained in residues because there is no melting loss in chemical reactions, whereas in smelting operations some metal is lost in skimmings and flue dust.

Dealers' buying prices for new zinc clippings averaged 7.28 cents a pound in 1949 compared with 9.42 cents in 1948 and 7.16 cents in 1947. The quotations were highest in January, averaging 12.44 cents for that month; thereafter they declined to 4.91 cents in June and then increased to 5.97 cents in December. The prices for old zinc scrap followed the same trend as that for clippings. The average for January was 9.94 cents and the lowest monthly average was 3.45 cents in July. In December the average had risen to 4.50 cents. The average price for the year was 5.45 cents compared with 7.01 cents in 1948 and 5.37 cents in 1947.

Consumers' stocks of zinc-base scrap in the United States at end of year, 1948–49, gross weight in short tons

Scrap item	Dec. 31, 1948	Dec. 31, 1949
Metallic zinc scrap	3,878	4,190
Dross	8,560	6,925
Skimmings and residues	23,337	19,101
Total	35,775	30,216

United States imports of old zinc scrap totaled 1,064 tons in 1949 compared with 1,636 tons in 1948. Imported drosses and residues totaled 2,668 tons in 1949, a decrease of 5,969 tons from the 8,637 tons imported in 1948. Large quantities of fume from a primary smelter in Canada were imported by one company for the manufacture of zinc sulfate and lithopone; the zinc reclaimed from this material was not recorded as secondary zinc but as recovered from material other than scrap. Exports of old zinc scrap in 1949 were 1,570 tons.

Slag—Iron Blast Furnace

By D. G. Runner

GENERAL SUMMARY

THE iron-blast-furnace-slag processing industry established a new record in 1949. Sales of screened air-cooled slag for use in highway construction, including portland-cement concrete and bituminous types, were greater than during the preceding year. Slag stocks are normally small and constant from year to year; therefore production virtually equals sales, and hence these terms are used interchangeably in this chapter. As indicated in the accompanying salient statistics table, sales in 1949 of air-cooled and granulated slag exceeded those reported for the previous year, but expanded slag declined slightly.

Although a great amount of literature on the production and uses of blast-furnace slag has been accumulating over many years, no comprehensive treatise encompassing this information had been published in English. However, a recent Bureau of Mines Bulletin,[1] sponsored by the National Slag Association, contains information of value to engineers, contractors, and architects.

Iron blast-furnace slag processed in the United States, 1945–49, by types

[1] Excludes value of slag used for cement manufacture.

PRODUCTION

The output of slag from iron blast furnaces in 1949 amounted to 30,093,957 short tons compared with 33,735,712 tons reported for the preceding year.

The quantity of slag processed for commercial use in 1949, according to reports of processors to the National Slag Association and the

[1] Josephson, G. W., Sillers, F., Jr., and Runner, D. G., Iron Blast-Furnace Slag: Production, Processing, Properties, and Uses: Bureau of Mines Bull. 479, 1949, 304 pp.

Bureau of Mines, reached a new high of 21,581,379 short tons valued at $24,578,712. These totals are 2 and 10 percent, respectively, above the preceding year's figures of 21,131,000 short tons valued at $22,360,000. The output in 1949 came from 66 plants processing air-cooled slag and 10 plants processing expanded slag. In all, 41 companies were engaged in processing air-cooled slag and 7 companies manufacturing expanded slag. Two companies began manufacturing expanded slag—the Lone Star Steel Co. at Lone Star, Texas, and the Steelton Foam Slag Co. at Steelton, Pa.

During 1949, iron blast-furnace slag was processed in the following States: Alabama, California, Colorado, Illinois, Indiana, Kentucky, Maryland, Michigan, New York, Ohio, Pennsylvania, Texas, and West Virginia. The majority of the plants are east of the Mississippi River, with Ohio, as in 1948, being the largest processor. Alabama and Pennsylvania follow in order. These three States supplied 61 percent of the total tonnage reported during 1949. The accompanying table shows the available details, by States, in 1949.

Iron blast-furnace slag processed in the United States, by States, in 1949

[National Slag Association]

State	Screened air-cooled			All types		
	Quantity		Value	Quantity		Value
	Short tons	Percent of total		Short tons	Percent of total	
Alabama	3,666,461	21	$3,636,350	4,217,515	20	$4,418,300

PREPARATION

Processed blast-furnace slag is usually marketed in air-cooled (screened or unscreened), granulated, or expanded form. The bulk of slag used today is of the air-cooled variety, the formation of which is characterized by slow cooling. In the production of air-cooled slag the molten material may be allowed to flow from the furnace into ladles in which it is transported to a slag bank or modified pit, or it may be allowed to flow into pits adjacent to the furnace. After the slag has solidified it is cooled, usually with a water spray, with subsequent cracking in the different layers. This condition facilitates excavating operations. After excavation the slag is crushed or screened, as with natural aggregates, for concrete aggregate, railroad ballast, and for many industrial purposes. Granulated slag is the granular product formed when molten slag is suddenly chilled by immersion in water. It is made by three general methods: Pit, jet, and dry granulation processes. Expanded slag is the foamed product formed when molten slag is expanded by applying a limited quantity of water.

Commercial slag contains only a small amount of free iron owing to the fact that during the processing stages it is passed over magnetic separators. Hand picking also is done in certain instances.

TRANSPORTATION

The bulk of slag processed in 1949 was moved by rail and truck. Only relatively small quantities were moved by waterway. As shown in an accompanying table, railroads handled 47 percent and trucks 51 [illegible]

truck shipments have increased correspondingly.

Shipments of iron blast-furnace slag in the United States, by methods of transportation, 1948–49

[National Slag Association]

Method of transportation	1948		1949	
	Short tons	Percent of total	Short tons	Percent of total
Rail	11,066,400	54	9,961,117	47
Truck	9,215,500	45	10,921,641	51
Waterway	145,200	1	401,785	2
Total shipments	20,427,100	100	21,284,543	100
Added to stocks	703,900		296,836	
Total processed	21,131,000		21,581,379	

CONSUMPTION

Screened air-cooled slag was the major product of the industry, accounting for 82 percent of the total slag processed during 1949. Granulated slag comprised 9 percent, expanded slag 6 percent, and unscreened air-cooled slag 3 percent.

Screened Air-Cooled Slag.—Consumption of screened air-cooled slag reached an all-time high of 17,769,330 short tons valued at $21,090,445—113,130 tons above the previous record year of 1948. The use of screened air-cooled slag as aggregate in portland-cement concrete construction, bituminous construction, other road-construction uses, and as railroad ballast consumed 15,879,737 short tons or 89 percent of the total for this type of slag. Other principal uses for this material were in the manufacture of concrete block, mineral wool, and roofing (built-up and granules).

Unscreened Air-Cooled Slag.—In 1949 the quantity of unscreened air-cooled slag processed totaled 727,595 short tons valued at $372,727—increases of 20 and 1 percent, respectively, over the 1948 figures. About half of this material was used in road construction.

Granulated Slag.—The consumption of granulated slag in 1949 amounted to 1,885,428 short tons—24 percent above the 1,517,500 tons reported in 1948. The principal uses for this material were in the manufacture of hydraulic cement and as road fill. These two uses consumed 79 percent of the total processed. The granulated slag was used in roads as insulation courses and as fill material. Granulated

[1] Other than in portland-cement concrete and bituminous construction.

slag is used by the Ohio State Highway Department, using Vibro-Tamper compaction machines, for bases under both rigid or flexible-type pavements.[2]

Expanded Slag Aggregate.—Consumption of expanded slag manufactured from molten slag declined slightly from the previous year. Sales amounted to 1,199,026 short tons valued at $2,698,908—representing a decrease of 11 percent quantitywise but an increase of 6 percent in dollar value. It is reported that the output was utilized principally as aggregate in the manufacture of concrete block.

Granulated and expanded iron blast-furnace slag sold or used by processors in the United States, by uses, in 1949

[National Slag Association]

PRICES

Average prices per ton for the various types of slag processed in 1949 are shown in an accompanying table. Values for screened air-cooled slag ranged from 87 cents for railroad ballast to $1.66 for slag used in the roofing industry. Unscreened air-cooled slag values ranged from 45 cents for railroad ballast to 51 cents for slag used in highway work (other than in portland-cement concrete and bituminous construction) and for "other uses." Available value figures on

[2] Slag Runner, vol. 1, No. 5, Apr. 15, 1949, pp. 1–2.

granulated slag ranged from 34 cents for "other uses" to $1.17 for agricultural slag, whereas the average value for expanded slag was $2.25.

IRON RECOVERY

Iron recovered in processing slag amounted to 206,470 short tons—4 percent under the 215,848 tons reclaimed in 1948. Iron is recovered from slag either by magnetic methods or by hand picking and represents a useful contribution to the iron and steel industry.

EMPLOYMENT

In all, 2,134 plant and yard employees were reported by the slag industry in 1949 (2,087 in 1948). The total number of man-hours utilized in 1949 was 5,169,000 compared with 5,419,000 in 1948.

TECHNOLOGY

The continued use of expanded slag as a lightweight aggregate focused attention on new plants and methods in 1949. A modern plant of the Lone Star Steel Co., Lone Star, Tex., began manufacturing expanded slag aggregate in June 1949. This product is produced and marketed under license of the Celotex Corp., Chicago. According to a description of the process, a Caldwell B machine with a capacity of about 50 tons per hour is directly connected with a slag chute at the discharge end of the furnace. The machine uses rotor-type expansion with water-cooled side plates, table, and cone.[3]

A method and apparatus for the production of expanded slag has been issued under United States Patent 2,450,978. In the process the molten slag is broken up and expanded by a water jet and then impelled by additional jets against a baffle so adjusted as to deflect the path of the slag pellets causing them to become fused together while in a plastic condition.[4]

[3] Pit and Quarry, vol. 42, No. 3, September 1949, pp. 88–90. Rock Products, vol. 52, No. 10, October 1949, pp. 154–155.
[4] Journal of the American Ceramic Soc., vol. 32, No. 4, Apr. 1, 1949, p. 106.

Announcement has been made that the Steelton Foam Slag Corp. plans to enter the lightweight slag field. Production of expanded slag was scheduled to start in May 1949.[5]

United States Patent 2,444,361, covering the fabrication of refractory hot-tops, tiles, and structural shapes, has been issued. According to a brief description of the process the mixture of blast-furnace slag (40–55 percent) and fire-clay (45–60 percent) is more easily extruded through dies, is lighter in weight, and shows less tendency to crack during the burning operation than when fabricated with clay alone.[6]

As stated in the 1948 chapter, dust in slag plants has long been a problem. In this connection, the Pennsylvania State Health Department made a survey of atmospheric conditions at plants of the Duquesne Slag Products Co., Pittsburgh, Pa. Samples were collected with midget impingers and standard Greenberg-Smith impingers, and dust counts, particle-size determinations, and chemical analyses were made. It was found that none of the dust samples exceeded the maximum allowable concentration of 50 million particles per cubic foot of air, which is the limit for dust containing less than 5 percent of free silica.[7]

During the year the slag industry agreed to conduct a safety contest, under supervision of the Federal Bureau of Mines, to promote safety among its employees. In all, 42 slag plants enrolled in the contest.

Investigations are underway by the Mont Coal Mines of Armco regarding the use of finely ground slag as a traction sanding medium in coal mines. The slag is intended to replace silica sand on account of the silicosis hazard. In addition, experiments are now underway involving both air-cooled and granulated slag by various groups on this promising use of slag.[8]

The application of granulated slag to construction of bases for either rigid or flexible-type highway pavements has been further advanced by engineers of the Ohio State Highway Department, using Vibro-Tamper compaction machines.[9]

Slate

By D. G. Runner and M. G. Downey

GENERAL SUMMARY

THE DOMESTIC output of slate during 1949 fell below the production reported in the preceding year. Sales in the roofing-slate portion of the industry, although lower than in 1948, constituted more than half the dollar value of the dimension-stone group and were well above the low record of 1944 and the intervening years. The average value per square in 1949 was $20.71, off 17 cents from the 1948 average. In the principal roofing-slate-producing centers, only Virginia gained in sales of this commodity. Sales in other areas—notably Pennsylvania, New York, Vermont, and Maine—declined from the previous year, according to reports from producers.

In contrast with the roofing-slate industry, production of mill stock exceeded the output in 1948. Sales amounting to $1,727,649 (about one-fourth of the total value of dimension stone) were 8 percent over 1948. Declines in production ranged from 9 percent for school slates to 37 percent for grave vaults and covers. With the exception of school slates, blackboards and bulletin boards, and structural and sanitary slate, values were below 1948 levels. The output of structural and sanitary slate and of blackboards and bulletin boards exceeded the 1948 totals both quantitywise and in dollar value, amounting to as much as 35 percent (value) in the case of structural and sanitary slate.

Flagstones, including slate employed for walkways, stepping stones, and miscellaneous uses trended upward, and the value of sales increased 30 percent over the preceding year.

Slate granules are used in making roofing materials that compete in the roofing-slate market. However, most of the slate consumed in the manufacture of granules and flour is unsuited for other slate products. Sales of granules and flour declined slightly from the previous year's totals. With the exception of 1946–48, inclusive, production was the greatest since the industry started, while the unit value ($9.48 per short ton) reached a record high. Figures for sales of granules of all types, including slate, are presented in the Stone chapter of this volume.

SALES

Dimension Slate.—Blocks or slabs cut to specified sizes and shapes are normally classed as "dimension slate"; this class includes all slate products except granules and flour. The following table shows sales of dimension slate for the latest 5-year period.

As roofing slate is used chiefly in residential building, comparison of roofing-slate sales with the number of new dwelling units highlights a rather interesting trend. The relationship between these items for

Dimension slate sold by producers in the United States, 1945–49

Year	Roofing			Mill stock		Other[1]		Total	
	Squares	Approximate equivalent short tons	Value	Approximate short tons	Value	Approximate short tons	Value	Approximate short tons	Value
1945	101, 300	38, 240	$976, 122	11, 520	$742, 345	19, 900	$253, 273	69, 660	$1, 971, 740
1946	146, 790	56, 240	1, 982, 928	12, 150	1, 032, 584	27, 860	403, 990	96, 250	3, 419, 502
1947	170, 590	64, 350	3, 094, 780	13, 550	1, 444, 835	34, 610	537, 705	112, 510	5, 077, 320
1948	218, 650	82, 090	4, 566, 056	11, 950	1, 600, 019	46, 490	700, 477	140, 530	6, 866, 552
1949	181, 490	68, 260	3, 759, 564	12, 730	1, 727, 649	51, 000	912, 503	131, 990	6, 399, 716

[1] Includes flagstones, walkways, stepping stones, and miscellaneous slate.

the period 1925 to 1949 is shown in figure 1. From 1929 to 1938, sales of roofing slate closely parallelled the normally expected requirements of the small building programs in those years. However, since 1938, sales of roofing slate have not paced the number of new dwelling units constructed. Factors influencing this situation are the inroads made by prepared roofing materials and the number of lower-priced houses for which slate is not commonly used.

Mill-stock slate is used extensively for equipment in nonresidential types of buildings, and in general its sales more or less parallel construction activity in this field from about 1929 to approximately 1939. From this point on, sales of mill stock fail to correlate with construction activity. The relationships for 1925 to 1949 are indicated in figure 1.

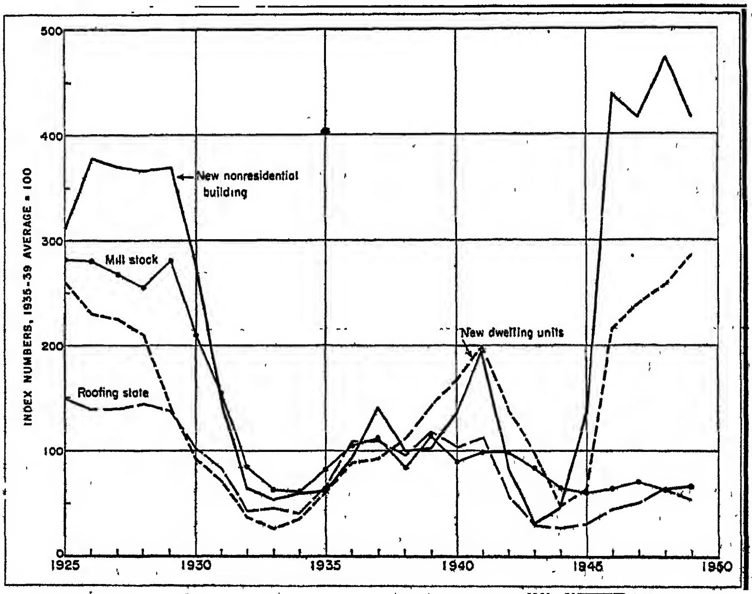

FIGURE 1.—Sales of roofing slate and mill stock compared with number of new dwelling units and value of new nonresidential construction, 1925–49. Data on number of new dwelling units (actual starts) in nonfarm areas from U. S. Department of Labor; on value of nonresidential construction activity from U. S. Department of Commerce, Survey of Current Business.

Figure 2 presents a graphic summary of the value of slate sold from 1915 to 1949, by uses. It will be noted that two peaks have been reached since 1915, one in 1925 and the other in 1948. The industry declined during the depression period and to a smaller extent during World War II.

Figure 3 presents a graphical summary of slate production, by uses, on a quantity basis. As indicated in the figure, granules and flour occupy a predominant place in the industry, quantitywise as well as in value of production.

Granules and Flour.—Sales of granules, which are used chiefly in surfacing prepared roofing, declined 7 percent in quantity and 3 percent in value compared with the 1948 figures. Sales of slate

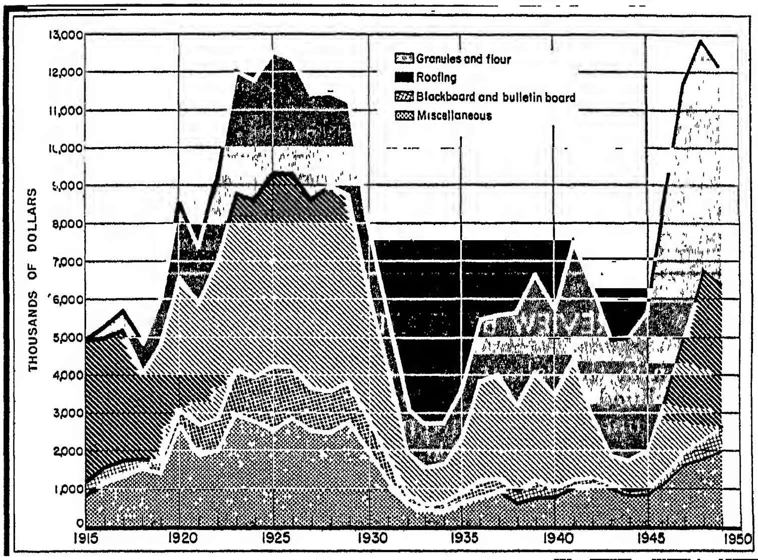

FIGURE 2.—Value of slate sold in the United States, 1915–49, by uses.

flour—a byproduct of granule manufacture and used in paints, roofing mastic, linoleum, and as a filler in road-asphalt surface mixtures—likewise declined. The decrease amounted to 9 percent quantitywise and 11 percent in value. Granules and flour were produced in Arkansas, California, Georgia, New York, Pennsylvania, and Vermont, while Maryland and Virginia produced granules only. Sales of these products for the latest 5-year period are shown in an accompanying table.

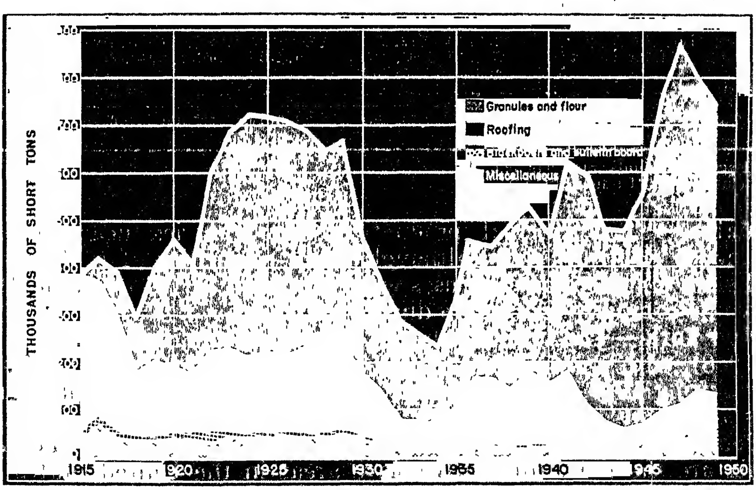

FIGURE 3.—Quantity of slate sold in the United States, 1915–49, by uses.

Crushed slate (granules and flour) sold by producers in the United States, 1945–49

REVIEW BY STATES AND DISTRICTS

As shown in the salient statistics table, total domestic production of slate declined 7 percent in 1949 compared with the 1948 output. A total of 80 operators reported production during the year, a decrease of 3. The accompanying table shows sales of slate in 1949, by States and uses.

Slate sold by producers in the United States, by States and uses, 1945–49

	Operators	Roofing		Mill stock		Other uses (value) [1]	Total value
		Squares (100 square feet)	Value	Square feet	Value

[1] Flagging and similar products, granules, and flour.
[2] Included with "Undistributed."

Maine.—The principal product of the quarries near Monson, Maine, is electrical slate, although small quantities of roofing slate and slate for miscellaneous uses were produced in 1949. As in 1948, only one company was active during the year.

New York.—The total number of slate operators increased to 16 (13 in 1948), with a resultant increase of 5 percent in the value of slate sold during 1949. The principal slate products were flagging, granules, and flour, and minor amounts of roofing slate.

Pennsylvania.—Lehigh and Northampton Counties in Pennsylvania are the most productive slate areas in the United States and furnish all types of slate products. Slate produced in York County in the Peach Bottom district, on the Maryland-Pennsylvania border

1948	928,340	535,254	192,960	117,754	402,940	13,036	1,420,169	5,351,153

[1] York County produced granules and flour only.

between Cardiff, Md., and Delta, Pa., may not be shown separately and therefore, in the accompanying table which gives detailed figures for Pennsylvania, is included with Northampton County.

The total value of all slate products sold in Pennsylvania in 1949 dropped 14 percent from the preceding year's value. Both quantity and value of roofing slate, electrical slate, vaults and covers, and billiard-table tops, and the quantity (but not value) of school slates, and slate for miscellaneous uses (including granules and flour) decreased below the 1948 totals. On the other hand, structural and sanitary slate and blackboards and bulletin boards registered gains. The percentage changes in these items in 1949 compared with 1948 were as follows: Roofing slate, decrease of 23 percent in quantity and 25 percent in value; electrical slate, decrease of 91 percent in quantity and 88 percent in value; structural and sanitary slate, increase of 24 percent in quantity and 25 percent in value; vaults and covers, decrease of 37 percent in quantity and 21 percent in value; blackboards and bulletin boards, increase of 23 percent in quantity and 21 percent in value; billiard-table tops, decrease of 15 percent in

quantity and value; school slates, decrease of 9 percent in quantity and increase of 6 percent in value. Slate for other uses decreased 15 percent in value. Most of the slate in this producing area is a blue-black, "soft-vein" material well adapted for structural products as well as for roofing. Detailed statistics for production in Pennsylvania are given in an accompanying table.

Vermont.—In order to avoid revealing the production figures of an individual firm, Maine has been included with Vermont in the table showing slate sold in the United States by States and uses. The total value of slate products sold in 1949 by Vermont and Maine was 2 percent less than in 1948. Decreases of 12 percent and 6 percent, respectively, were registered in total sales value of roofing slate and mill stock in 1949, while the value of slate for other uses increased 4 percent.

Virginia.—The principal product of the Buckingham County quarries is a dark-gray or slightly greenish slate. In 1949, 20,430 squares of roofing slate, valued at $558,314, were produced in this district, representing increases of 18 percent in quantity and 32 percent in value over the 1948 totals. Substantial amounts of granules were produced during the year but details cannot be given because there were too few producers.

Other Districts.—Slate products, chiefly granules and flour, were produced in Montgomery County, Ark., near Glenwood; near Placerville, El Dorado County, and in Tuolumne County, Calif.; near Fairmount, Bartow County, Ga.; and at Whiteford, Harford County, Md.

PRICES

The average value of roofing slate, f. o. b. quarry or mill, as reported to the Bureau of Mines, decreased 17 cents per square to $20.71 in 1949. In Pennsylvania it was $18.82 per square, in New York $45.06, in Vermont and Maine $22.21, and in Virginia $27.33.

The average value of mill stock was 63 cents per square foot in 1949, as it was in 1948. The average value of electrical slate increased 12 cents (to $1.33), structural and sanitary slate increased 3 cents (to $0.78), grave vaults and covers increased 15 cents (to $0.82), blackboards decreased 1 cent (to $0.57), and there was no change in the value for billiard-table tops ($0.61). The average sales value of granules a short ton increased 46 cents, while flour decreased 11 cents.

Price History.—The trend of annual average value of roofing slate and mill stock compared with the wholesale prices of all building materials over a 35-year period is indicated in figure 4. From 1915 to 1920 slate prices (compared with 1935–39 base period) have been somewhat below the general average for building materials, while from 1921 to 1936 they were above the average. Fairly close agreement with the general average of building materials was maintained from 1936 to 1945, at which time a steady uptrend began in the values of roofing slate.

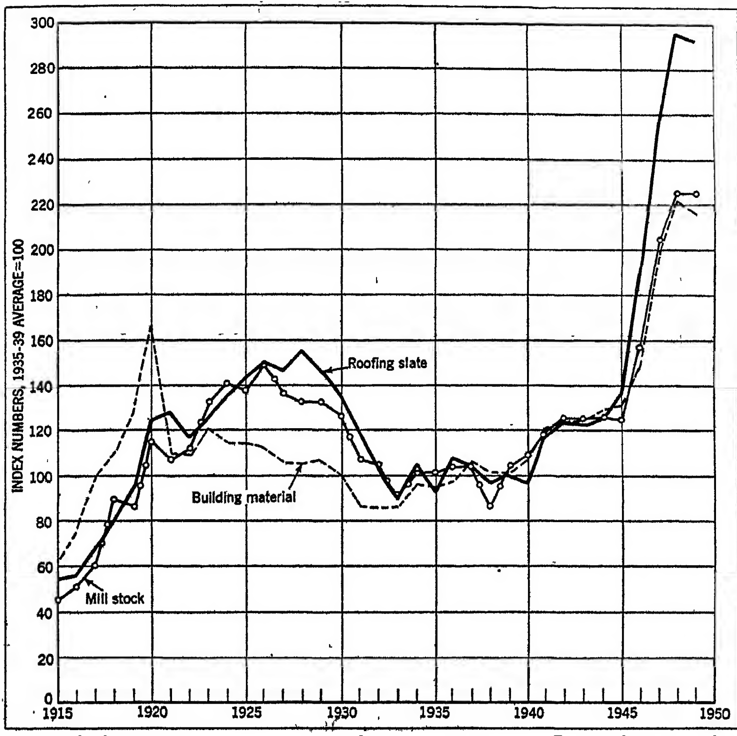

FIGURE 4.—Average value of slate compared with wholesale prices of building materials in general, 1915–49. Wholesale prices from U. S. Department of Labor.

FOREIGN TRADE

Imports.[1]—The value of slate imported for consumption has been increasing steadily since 1944, when the total was $51. In 1948 the value amounted to $13,652, while in 1949 the figure increased 52 percent to $20,753. Of this latter figure, $969 (26,622 square feet) was for roofing and $19,784 was classified as "other."

Exports.—The following tabulation gives the value of exports of slate products for the latest 5-year period as reported by shippers to the Bureau of Mines. In 1949 the total value of exports was $595,023, an increase of 1 percent.

[1] Figures on imports compiled by M. B. Price and E. D. Page, of the Bureau of Mines, from records of the U. S. Department of Commerce.

Slate imported for consumption in the United States, by countries, 1944–49 [1]

[U. S. Department of Commerce]

[1] Figures collected by the Bureau of Mines from shippers of products named.
[2] Includes slate used for pencils and educational toys.

TECHNOLOGY

The growing use of lightweight aggregates in the construction industry continues to be of considerable interest. Lightweight aggregate is produced from a slate deposit near Richmond, Va.[2] United States Patent 2,456,207 covers the production of lightweight aggregate utilizing unpulverized slate particles. A report in which the properties of expanded slate when used in concrete are discussed has recently been released.[3]

UNITED KINGDOM

A recent report describes experience in diamond-sawing the green slate in Westmorland, Cumberland, and Lancashire areas, England. The article states that the slate found in these counties is much harder than Welsh slate rock and illustrates the benefits to be found in diamond-sawing the larger blocks to slate size.[4]

A factory designed to produce floor tiles is to be opened at Portmadoc, Wales. It is planned to use slate dust from Welsh quarries.[5] An article describing the Dinorwic slate operation also has been released.[6]

Stone

By D. G. Runner and Nan C. Jensen

GENERAL SUMMARY

COMBINED sales of dimension and crushed stone in 1949 declined slightly from the output of 225,535,390 short tons in 1948. Although production was down during the year, the total value—$341,441,645—was 4 percent greater than in 1948. The production of dimension stone declined 3 percent, but the value was up 8 percent, while the sales of crushed and broken stone decreased 1 percent quantitywise but rose 3 percent in value compared with 1948. The average unit values for all classes of dimension stone increased over 1948 figures.

In the crushed- and broken-stone industry, average values of riprap, stone for asphalt filler, and stone for use in paper mills decreased; stone for railroad ballast maintained the 1948 average value, while all other uses followed an uptrend.

The tables in this chapter give the quantities sold or used by producers and the values f. o. b. quarries and mills. Stone quarried and used by producers is considered sold and is, therefore, included with sales in the statistics. The data, however, do not include stone made into abrasives, such as grindstones, or that material used in making lime and cement. These materials are reported in terms of finished products in the Abrasive Materials, Lime, and Cement chapters of this volume. This chapter follows the general plan introduced in 1938, whereby dimension stone and crushed stone are considered separately, except in the introductory tables. The following tables show the total sales of stone by kinds, uses, and States.

Stone sold or used by producers in the United States, 1945–49, by kinds

Year	Granite		Basalt and related rocks (traprock)		Marble		Limestone	
	Short tons	Value	Short tons	Value	Short tons	Value	Short tons	Value
1945	7,740,030	$17,052,764	14,910,540	$17,532,775	171,230	$5,284,827	112,574,420	$121,441,509

[1] To avoid disclosing confidential information certain State totals are incomplete, the figures not included being combined with "Undistributed." The class of stone omitted from such State totals is noted in the State tables in the Statistical Summary chapter of this volume.
[2] Included with "Undistributed."

DIMENSION STONE

The term "dimension stone," as used in this chapter, is applied to blocks or slabs of natural stone, most of which are cut to definite shapes and sizes. The chief uses of dimension stone are for the construction of masonry walls and for memorials. On the other hand, crushed and broken stone consists of irregular fragments sized chiefly by mechanical screening methods. The principal applications of this type of material are as concrete aggregate, railroad ballast, and furnace flux, for liming the land, and for various industrial uses that have little or no relation to masonry construction.

Dimension-stone producers may be divided into three main groups upon the basis of plant operation. The first group quarries stone and sells it as rough blocks or slabs; the second group quarries stone and also manufactures it into finished products; while the third group buys sawed slabs or rough blocks of stone and manufactures them into finished products but does not operate quarries. The Bureau of Mines statistical canvass covers the first and second groups but not the third. Bureau of Mines statistics are compiled from reports of quantities and values of original sales; hence they include some material sold as rough blocks and some sold as finished products.

Total sales of dimension stone (including slate) in 1949 decreased 3 percent in quantity but increased 6 percent in value compared with 1948. Virtually all of the total figures in this chapter exclude slate, but details of this branch of the industry are given in the separate chapter on Slate of this volume.

The following table presents salient statistics for 1948 and 1949.

Dimension stone sold or used by producers in the United States, 1948–49, by kinds and uses

Kind and use	1948	1949 Total	1949 Percent of change
Granite:			
Building stone:			
Rough construction .... short tons	136,630	55,080	−60
Value	$421,178	$316,755	−25
Average per ton	$3.08	$5.75	+87
Cut stone, slabs, and mill blocks .... cubic feet	713,350	820,650	+15
Value	$3,913,426	$4,300,878	+10
Average per cubic foot	$5.49	$5.24	−5
Rubble .... short tons	109,660	85,660	−22
Value	$236,774	$204,498	−14
Monumental stone .... cubic feet	3,326,990	2,772,580	−17
Value	$16,458,601	$15,100,149	−8
Average per cubic foot	$4.95	$5.45	+10
Paving blocks .... number	392,110	275,570	−30
Value	$32,810	$27,384	−17
Curbing .... cubic feet	699,370	578,760	−17
Value	$1,259,932	$1,365,310	+8
Total:			
Quantity .... approximate short tons	639,180	485,860	−24
Value	$22,322,721	$21,314,974	−5
Basalt and related rocks (traprock):			
Building stone:			
Rough construction .... short tons	3,340	28,100	+741
Value	$16,700	$92,669	+455
Average per ton	$5.00	$3.30	−34
Rubble .... short tons	54,890	7,270	−87
Value	$60,613	$5,030	−92
Total:			
Quantity .... short tons	58,230	35,370	−39
Value	$77,313	$97,699	+26

Value	$54,890,671	$58,145,841	+6

[1] Includes soapstone, mica schist, volcanic rocks, argillite, and other varieties that cannot be classified in the principal groups.
[2] Details of production, by uses, are given in the Slate chapter of this volume.

BUILDING STONE

The use of stone as construction material has always occupied an important place in the building of nonresidential edifices. Continued building activity in 1949 resulted in an output of 11,890,440 cubic feet of stone—a decrease of 6 percent quantitywise but an increase of 20 percent in value compared with 1948 totals.

Building stone sold or used by producers in the United States in 1949, by kinds

Kind	Rough			
	Construction		Architectural	
	Cubic feet	Value	Cubic feet	Value

[1] Sawed stone corresponds to dressed stone for construction work (walls, foundations, bridges) and cut stone to architectural stone for high-class buildings.
[2] Rough and cut miscellaneous stone included with sawed stone.

GRANITE

Sales of granite in the form of blocks and slabs declined 24 percent in quantity and 5 percent in value compared with 1948. Except for rough architectural, all unit values were greater than those for 1948. In the building-stone branch of the industry, sales of rough architectural stone gained 69 percent in quantity and 67 percent in value, and dressed stone increased 5 percent in value over 1948. Stone for rough construction and rubble declined not only in quantity but in value as well, while dressed stone decreased in quantity. Dressed monumental stone decreased slightly in quantity but increased 4 percent in value, while rough monumental stone decreased both in quantity and value compared with 1948. In 1949 the value of curbing increased slightly, but quantity decreased, while both the output and value of paving blocks declined from 1948 levels.

Estimated sawing cost	1,460,098	1,644,234	1,408,428
Total value of granite	13,717,237	15,873,101	16,487,450

BASALT AND RELATED ROCKS (TRAPROCK)

Owing to their dark color, basalt and related rocks are not used extensively as building stone. Total sales in 1949 decreased 39 percent in quantity but increased 26 percent in value. Sales of basalt in 1949 for rough construction were greater than in 1948; but output for rubble, a crude form of building stone, amounted to about one-eighth of the previous year's total. Unit values for these two types of material declined from $5.00 and $1.10 to $3.30 and $0.69, respectively. Basalt and related dark rocks are used to some extent for memorials, but such stones are normally classed in the trade as "black granite" and are therefore included with statistics for monumental granite.

Basalt and related rocks (traprock) (dimension stone) sold or used by producers in the United States in 1949, by States and uses

State	Active plants	Building stone: Rough construction: Short tons	Building stone: Rough construction: Value	Building stone: Rubble: Short tons	Building stone: Rubble: Value	Total: Short tons	Total: Value

[1] Included with "Undistributed."
[2] 327,660 cubic feet (approximate).

MARBLE

In 1949 total sales of marble increased 23 percent quantitywise and 22 percent in value compared with 1948. Marble for building stone, for both exterior and interior use, increased substantially in quantity and value over 1948, whereas sales of monumental stone decreased 11 and 10 percent in quantity and value, respectively. The average unit value for building and monumental marble increased 16 and 9 cents, respectively, to $8.87 and $10.37, whereas the total average unit value decreased 4 cents to $9.31. Details on marble, by uses and States, are shown in accompanying tables.

Marble (dimension stone) sold by producers in the United States, 1948–49, by uses

Use	1948: Cubic feet	1948: Value	1949: Cubic feet	1949: Value

LIMESTONE

Limestone blocks cut to definite shapes and sizes are used almost exclusively for building purposes. Such material is used for interiors and exteriors of public buildings of all kinds, such as post offices, churches, museums, schools, and commercial structures. Since the war the industry has been climbing steadily in production, and 1949 was no exception. Although building stone, for both rough construction and rough architectural, declined in 1949, cut and sawed material increased sharply in quantity and value. The output of rubble doubled in quantity and increased two-thirds in value over 1948, while stone for flagging decreased slightly in quantity but gained 10 percent in value.

With the exception of rubble, all unit values increased in 1949, and the over-all average value increased from $17.43 in 1948 to $18.64 in 1949.

The area in the United States most productive of dimension limestone is in the vicinity of Bedford and Bloomington, Ind. This area supplied 78 percent of the rough architectural and finished (sawed and cut) limestone in 1949. Accompanying tables show production in the Bedford-Bloomington, Ind., and Carthage, Mo., areas over a 5-year period.

SANDSTONE

The total production of sandstone in 1949 increased 10 percent in quantity and 12 percent in value compared with 1948. Stone for rough construction decreased 26 percent quantitywise and 36 percent in value, whereas the output of rough architectural stone almost doubled in quantity and value. Dressed sawed material decreased slightly in quantity but increased in value, while cut stone decreased 60 percent in quantity and 30 percent in value compared with 1948. Rubble, curbing, and flagging gained substantially in quantity and value over 1948 totals. Average unit values in 1949 decreased for rough construction and rubble and increased for all other types of sandstone.

As in previous years, Ohio was the principal producer and contributed 46 percent of the total output. Other producing States, in order of production, were Pennsylvania, Tennessee, and New York.

The accompanying table shows the sales of bluestone in 1940–49. Bluestone is a type of sandstone that splits readily into thin, uniform slabs. It is particularly well adapted for flagging but is used also for building stone and curbing. The output of bluestone in 1949 increased 21 percent in quantity and 15 percent in value compared with 1948.

Bluestone (dimension stone) sold or used in the United States, 1940–49 [1]

Year	Cubic feet	Value	Year	Cubic feet	Value
1940	256,900	$272,501	1945	109,330	$89,448
1941	284,190	252,313	1946	273,720	274,517
1942	183,470	166,787	1947	274,680	326,168
1943	99,840	92,059	1948	325,940	462,716
1944	156,160	108,732	1949	395,500	533,727

[1] New York and Pennsylvania were the only producing States.

MISCELLANEOUS STONE

Types of stone other than those included in the major groups already discussed are covered in the following table. The principal types in this classification are mica schist, argillite, light-colored volcanic rocks (such as rhyolite), soapstone, and greenstone. The quantity sold in 1949 increased 12 percent while the value increased 5 percent compared with 1948.

TRENDS IN USE OF DIMENSION STONE

The history of dimension-stone production by kinds, for a 34-year period, is reviewed in figure 1. Dimension stone finds little use during wartimes, as illustrated by low sales figures for 1918 and 1944. However since the low of 1944 the curve has been upward, and the current building activity points to continued expansion.

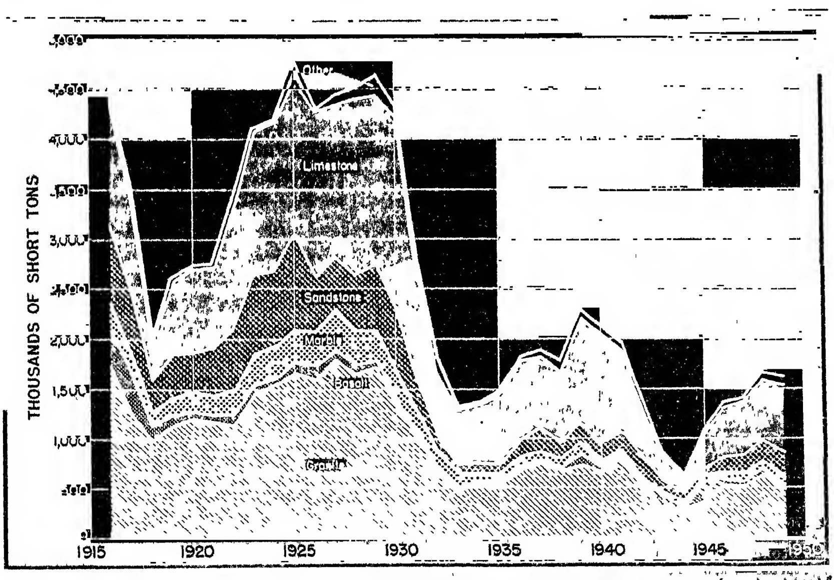

FIGURE 1.—Sales of dimension stone in the United States, by kinds, 1916–49.

Figure 2 traces for a 35-year period the history of production of all building stones and of the chief variety—limestone—in their relation to nonresidential building, the class of construction using stone most extensively. Activity in building-stone production in peacetime generally follows the trend of nonresidential construction. The industry currently is following the general trend but at a lower level.

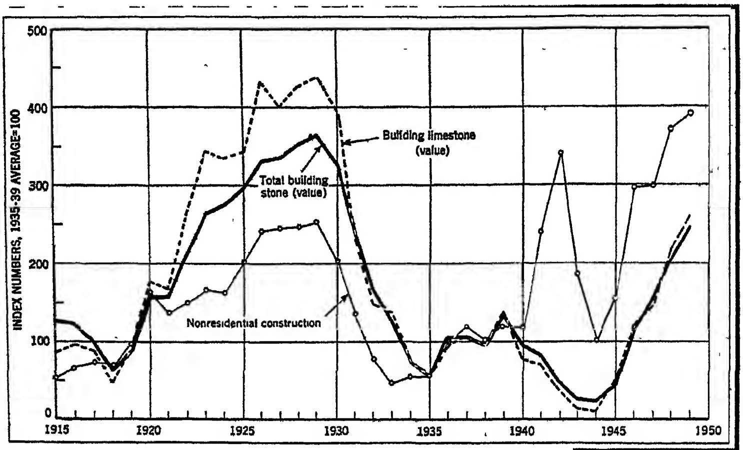

FIGURE 2.—Sales of all building stone and building limestone compared with nonresidential construction (public and private), 1915–49. Data on nonresidential-building construction from Survey of Current Business.

TECHNOLOGY

Mention was made in the 1948 Stone chapter of the stone-wall exposure panel erected at the National Bureau of Standards. It is hoped that, from a long-time study of many stone types in this wall, it will be possible to develop more reliable laboratory methods for determining or predicting durability. A recent article describes the various stones used in the test [1] wall, the waterproofing treatments, etc.

A new durability test for marble has recently been advocated. Inasmuch as marbles from different sources vary in durability, it was desirable to develop a test to determine the type of changes that occur in marbles during weathering processes. A so-called gypsum test was devised for this purpose.[2]

A thermal expansion of stone and component minerals has long provided a fertile field of research. A report on the expansion of calcite and marble has been released. Details of the expansion of these two materials, along various axes and orientations, and to temperatures up to 700° C., are presented in the article.[3]

Another item of interest to the stone industry is the development of gage and recording equipment for measuring dynamic strain in rock. The strain gage, inserted and anchored in a small-diameter diamond-drill hole, with a companion amplifier and recording camera, picks up

[2] Kessler, D. W., A New Durability Test for Marble: Am. Soc. Test. Mat. Bull. 159, July 1949, pp. 45–49; also Stone, vol. 70, No. 10, October 1949, pp. 219–225.

[3] Rosenholtz, J. L., and Smith, D. T., Linear Thermal Expansion of Calcite, Var. Iceland Spar, and Yule Marble: Am. Mineral., vol. 34, Nos. 11–12, November–December, 1949, pp. 846–854.

and records the strain waves produced in rock by a nearby explosion.[4]

The theory has long been accepted that granite is a product of crystallization from magma. A recent report takes exception to this assumption and presents evidence that granite originated by diffusion and reaction in the solid state. Among the items mentioned in support of this concept are feldspathization of inclusions, double and reciprocal inclusions, digestion of transgressive dikes by the host rock, and microscopic evidence of replacement and corrosion.[5]

The porosity of limestone also has been made the subject of recent research.[6]

CRUSHED AND BROKEN STONE

The production of crushed and broken stone was only slightly smaller in 1949 than in 1948. The output amounted to 222,408,140 short tons, in addition to that used for making cement and lime, valued at $289,695,520—a decrease of 1 percent in tonnage but a value increase of 3 percent.

Gains were recorded in sales of concrete and road metal, riprap, agricultural stone, asphalt filler, and stone for sugar factories, whereas sales of crushed stone for other principal uses declined. The average value at the quarry increased 4 cents to $1.30 per ton.

The accompanying table of salient statistics shows the quantity sold and the value of the output during 1948 and 1949, by uses. Detailed data on asphaltic stone and slate granules and flour are given in the Asphalt and Slate chapters of this volume.

Crushed and broken stone sold or used by producers in the United States, 1948–49, by principal uses

Use	1948			1949

[1] To avoid disclosing confidential information, total is somewhat incomplete, the figures not included being combined as "Undistributed."
[2] Included with "Undistributed."

COMMERCIAL AND NONCOMMERCIAL OPERATIONS

The accompanying table shows the production of crushed stone for concrete and road metal during recent years by Government agencies of various kinds, contrasted with that by commercial enterprises. Before 1940, Government-sponsored activities produced a substantial amount of the total output. However, the war and postwar conditions changed this situation. Consequently the output of crushed stone by noncommercial agencies dropped to 7 percent of the total production in 1945 and 1946 and has remained at 11 percent from 1947 through 1949.

Crushed stone for concrete and road metal sold or used by commercial and noncommercial operators in the United States, 1945–49

[Figures for "noncommercial operations" represent tonnages reported by States, counties, municipalities, and other Government agencies, produced either by themselves or by contractors expressly for their consumption, often with publicly owned equipment; they do not include purchases from commercial producers. Figures for "commercial operations" represent tonnages reported by all other producers.]

Year	Commercial operations				Noncommercial operations				Total	
	Short tons	Average value per ton	Percent of change in quantity from preceding year	Percent of total quantity	Short tons	Average value per ton	Percent of change in quantity from preceding year	Percent of total quantity	Short tons	Percent of change in quantity from preceding year
1945	59,347,220	$1.01	+4	93	4,760,970	$1.12	−40	7	64,108,190	−1
1946	83,879,680	1.07	+41	93	6,479,220	1.23	+36	7	90,358,900	+41
1947	95,178,440	1.19	+13	89	11,899,150	1.09	+84	11	107,077,590	+19
1948	108,029,360	1.23	+14	89	13,512,810	1.25	+14	11	121,542,170	+14

GRANULES

The output of granules for roofing purposes has been canvassed since 1942. The following table shows total production and value for the past 5 years. Separate figures for slate granules are given in the Slate chapter of this volume.

Roofing granules [1] sold or used in the United States, 1945–49, by kinds

Year	Natural		Artificially colored		Brick		Total	
	Short tons	Value	Short tons	Value	Short tons	Value	Short tons	Value
1945	355,840	$2,628,052	628,220	$9,124,891	61,220	$947,637	1,045,280	$12,700,580
1946	447,910	3,470,411	877,990	12,939,512	54,660	866,174	1,380,560	17,276,097
1947	504,980	4,166,810	1,133,870	17,559,227	56,570	998,434	1,695,420	22,724,471
1948	448,150	3,828,307	1,002,430	16,563,351	35,110	586,173	1,485,690	20,977,831
1949	352,846	3,088,402	977,934	16,489,253	23,425	400,919	1,354,205	19,978,574

[1] Manufactured from stone, slate, slag, and brick.

SIZE OF PLANTS

In 1948 the average crushed-stone plant produced approximately 131,000 short tons; in 1949 this average decreased to about 122,000 tons. During the year 579 plants reported a production of less than 25,000 tons, but they produced less than 3 percent of the total output while 26 plants that produced 900,000 tons or over contributed 22 percent of the total. The accompanying table shows additional details of the size pattern of the industry.

Number and production of commercial crushed-stone [1] plants in 1948-49, by size of output

Size of output	1948				1949			
	Number of plants	Total production of plants (short tons)	Percent of total	Cumulative total (short tons)	Number of plants	Total production of plants (short tons)	Percent of total	Cumulative total (short tons)
Less than 1,000 tons	45	19,910	0.01	19,910	60	21,250	0.01	21,250
1,000 to 25,000	493	5,312,260	2.56	5,332,170	519	5,542,200	2.72	5,563,450
25,000 to 50,000	272	9,836,410	4.75	15,168,580	259	9,291,880	4.57	14,855,330
50,000 to 75,000	199	12,245,870	5.91	27,414,450	224	13,742,110	6.75	28,597,440
75,000 to 100,000	103	8,785,280	4.24	36,199,730	107	9,095,350	4.47	37,692,790
100,000 to 200,000	211	29,510,390	14.24	65,710,120	231	32,079,020	15.77	69,771,810
200,000 to 300,000	106	25,757,880	12.43	91,468,000	112	27,188,560	13.36	96,960,370
300,000 to 400,000	54	18,704,550	9.03	110,172,550	49	16,611,580	8.17	113,571,950
400,000 to 500,000	29	13,103,030	6.32	123,275,580	29	13,151,480	6.46	126,723,430

600,000 to 700,000	12	7,574,620	3.66	139,153,570	12	7,746,050	3.81	143,882,820
700,000 to 800,000	7	5,182,000	2.50	144,335,570	10	7,545,410	3.71	151,428,230
800,000 to 900,000	10	8,474,400	4.09	152,809,970	7	6,540,890	3.21	157,969,120
900,000 tons and over	29	54,403,250	26.25	207,213,220	26	45,503,740	22.36	203,472,860
Total	1,585	207,213,220	100.00	207,213,220	1,662	203,472,860	100.00	203,472,860

[1] Exclusive of marble, which is primarily a dimension-stone industry.

METHODS OF TRANSPORTATION

As shown in the accompanying table, truck transportation is the principal method used in the crushed-stone industry, followed by rail shipments. As in past years, waterways provide relatively minor but locally important transportation facilities. In previous years the table included only transportation statistics on the commercial stone used for concrete and road metal, but since 1946 the table has included all commercial crushed stone.

Crushed stone sold or used in the United States in 1949, by methods of transportation

Method of transportation	Commercial operations		Commercial and noncommercial [1] operations	
	Short tons	Percent of total	Short tons	Percent of total
Truck	101,656,200	50	120,453,760	54
Rail	71,640,310	35	71,640,310	32
Waterway	21,419,240	11	21,419,240	10
Unspecified	8,894,830	4	8,894,830	4
Total	203,610,580	100	222,408,140	100

[1] Entire output of noncommercial operations assumed to be moved by truck.

GRANITE

Sales of crushed and broken granite in 1949 rose sharply, as gains of 26 percent in quantity and 29 percent in value were registered, while the average unit value increased 3 cents to $1.29. The most decisive gain was in granite sold for riprap, which advanced 173 percent in quantity and 146 percent in value. Crushed granite used for concrete and road metal increased 11 percent quantitywise and 19 percent in value, whereas stone for railroad ballast increased 66 percent in sales value and 50 percent in quantity. Granite for "other uses," such as grit, road base, stone sand, etc., also showed a substantial increase in output. Average unit values increased 9 cents to $1.40 for concrete and road metal and 11 cents for railroad ballast, while decreases of 12 cents and 38 cents were recorded for riprap and "other uses," respectively. North Carolina was the principal producer in 1949, followed by Georgia, South Carolina, California, and Virginia, in that order.

BASALT AND RELATED ROCKS (TRAPROCK)

Commercial traprock normally includes basalt, gabbro, diorite, and other dark igneous rocks and is widely used in industry for concrete and road metal and railroad ballast. Other uses include stone for riprap and such "other uses" as fill material, roofing granules, etc. In 1949 Oregon was the leading producer, followed by New Jersey, Washington, Pennsylvania, Connecticut, Massachusetts, and California, in that order. Sales of crushed and broken traprock were 4 percent greater in quantity and 2 percent greater in value than in 1948. The average unit values increased for riprap but decreased for all other end uses, while the grand average unit value for all uses decreased 3 cents to $1.42.

MARBLE

Marble producers, in the course of their manufacturing processes, accumulate large quantities of waste material consisting of either defective blocks or cuttings and spalls from marble-dressing operations. This byproduct material usually is marketed for the many uses listed in the footnote of the accompanying table. The average value varies from State to State, for the reason that in certain States a large portion of this material is marketed for such high-priced products as terrazzo or marble flour, whereas in other States a considerable amount is sold for roadstone, concrete aggregate, or other relatively low-priced uses. The average unit value for crushed and broken marble increased $1.47 to $8.28.

Marble (crushed and broken stone) sold by producers in the United States in 1949, by States [1]

State	Active plants	Short tons	Value	State	Active plants	Short tons	Value
Alabama	2	(2)	(2)	Texas	1	10,000	$200,000

[1] Includes stone sold for fill material, roofing granules, and unspecified uses.
[2] Included with "Undistributed."

LIMESTONE

Due to its chemical and physical properties, wide distribution, and comparatively moderate production costs, limestone is used more extensively than any other type of crushed and broken stone. Sales of limestone were reported to the Bureau of Mines from 44 States and 2 Territories in 1949. In 1949, limestone (excluding that used in the manufacture of cement and lime) constituted 73 percent of the total crushed and broken stone produced in the United States. Sales of stone for riprap, concrete and road metal, and agriculture increased over 1948, whereas the output of fluxing stone, railroad ballast, and stone for miscellaneous uses decreased in 1949. Details by States and uses are shown in an accompanying table.

Limestone (crushed and broken stone) sold or used by producers in the United States for miscellaneous uses, 1948–49

Use	1948		1949	
	Short tons	Value	Short tons	Value
Alkali works	7,349,540	$5,942,572	6,022,240	$5,641,705
Calcium carbide works	1,052,080	1,027,952	652,950	654,470
Coal-mine dusting	414,910	1,640,476	284,840	1,130,061
Filler (not whiting substitute):				
Asphalt	553,360	1,593,820	671,560	1,893,964
Fertilizer	612,040	1,155,690	666,260	1,361,999
Other	262,680	841,406	257,540	974,509
Filter beds	19,940	38,985	56,020	100,741
Glass factories	666,360	1,410,120	621,840	1,373,314
Limestone sand	1,033,820	954,544	1,241,340	1,196,921
Limestone whiting [1]	537,230	3,590,757	501,400	3,511,159
Magnesia works (dolomite) [2]	229,200	315,680	241,070	428,723
Mineral food	422,850	1,843,910	413,850	1,837,105
Mineral (rock) wool	40,540	47,053	42,600	50,737
Paper mills	475,880	908,098	417,850	766,856
Poultry grit	72,040	653,087	101,980	904,053
Refractory (dolomite)	1,323,090	1,497,285	1,365,700	1,485,004
Road base	272,640	229,054	934,720	710,369
Stucco, terrazzo, and artificial stone	36,520	381,282	47,670	505,268
Sugar factories	471,030	1,098,933	555,030	1,361,169
Other uses [3]	1,164,220	1,642,181	589,290	926,608
Use unspecified	517,740	663,115	575,160	813,559
Total	17,527,710	27,476,000	16,260,910	27,628,294

[1] Includes stone for filler for calcimine, caulking compounds, ceramics, chewing gum, explosives, floor coverings, foundry compounds, glue, grease, insecticides, leather goods, paint, paper, phonograph records, picture-frame moldings, plastics, pottery, putty, roofing, rubber, tooth paste, wire coating, and unspecified uses. Excludes limestone whiting made by companies from purchased stone.
[2] Includes stone for refractory magnesia.
[3] Includes stone for acid neutralization, athletic-field marking, carbon dioxide, chemicals (unspecified), concrete blocks and pipes, dyes, fill material, light bulbs, motion-picture snow, oil-well drilling, patching plaster, rayons, roofing granules, spalls, and water treatment.

Dolomite (calcium-magnesium carbonate) has many uses, some of them distinct from those of high-calcium limestone. Dead-burned dolomite is used as a refractory lining for metallurgical furnaces, and statistical data on this product (which is closely allied to lime) are given in the Lime chapter of this volume. Raw dolomite is also used as a refractory, particularly for patching furnace floors.

Sales of dolomite and its primary product of calcination—dolomitic lime—for certain uses are covered in the accompanying table.

Dolomite and dolomitic lime sold or used by producers in the United States for specified purposes, 1948–49

	1948		1949	
	Short tons	Value	Short tons	Value
Dolomite for—				
Basic magnesium carbonate [1]	229,200	$315,680	241,070	$428,723
Refractory uses	1,323,090	1,497,285	1,365,700	1,485,004
Dolomitic lime for—				
Refractory (dead-burned dolomite)	1,544,755	17,847,182	1,318,708	15,930,226
Paper mills	56,000	554,000	50,000	552,000
Total (calculated as raw stone)	4,754,000		4,344,000	

[1] Includes dolomite for refractory magnesia.

The following table shows the tonnages and values of fluxing stone sold for use in various metallurgical operations.

Sales of fluxing limestone, 1945–49, by uses

Year	Blast furnaces		Open-hearth plants		Other smelters [1]		Other metallurgical [2]		Total	
	Short tons	Value	Short tons	Value	Short tons	Value	Short tons	Value	Short tons	Value
1945	21,901,820	$17,111,472	5,038,140	$4,286,889	502,230	$491,178	197,330	$186,854	27,639,520	$22,076,393
1946	19,674,130	15,803,857	4,869,300	4,342,467	449,050	490,566	165,280	154,943	25,157,760	20,791,833
1947	25,817,270	22,000,942	6,059,440	5,862,292	512,880	593,811	180,680	230,905	32,570,270	28,687,950
1948	26,339,790	24,721,052	7,873,410	8,695,137	503,490	609,354	185,250	224,465	34,901,940	34,250,008
1949	23,354,950	23,734,574	5,922,020	6,929,134	728,960	835,962	332,370	374,649	30,338,300	31,874,319

[1] Includes flux for copper, gold, lead, zinc, and unspecified smelters
[2] Includes flux for foundries and for cupola and electric furnaces.

As the statistics of the lime and cement industries are presented in separate chapters of the Minerals Yearbook, they are not covered in the Stone chapter. However, a commodity review of limestone would be incomplete without suitable recognition of the large tonnage of limestone consumed by these industries. Consequently, the following table shows the total tonnage of limestone consumed for all purposes.

Limestone sold or used for all purposes in the United States, 1947–49, in short tons

Use	1947	1948	1949
Limestone (as given in this report) (approximate)	150,409,000	166,742,000	163,746,000
Portland and natural cement and cement rock [1]	49,530,000	54,513,000	55,219,000
Lime [2]	13,558,000	14,528,000	12,637,000
Total	213,497,000	235,783,000	231,602,000

[1] Reported in terms of cement in Cement chapter of this volume.
[2] Reported in terms of lime in Lime chapter of this volume.

SANDSTONE

Sales of crushed and broken sandstone in 1949 decreased 5 percent in quantity but increased 10 percent in value compared with 1948. A substantial increase in the tonnage for riprap is noteworthy, but decreases in output were recorded for refractory stone, concrete and road metal, railroad ballast, and "other uses." Average unit values increased for all end uses while the grand average unit increased 31 cents to $2.27.

MISCELLANEOUS STONE

Crushed and broken stone, other than the five principal varieties already discussed, includes light-colored volcanic rocks, schists, boulders from river beds, serpentine, chats, and flint. The following table shows sales of stone of these types in 1949. The output during 1949 decreased 13 percent quantitywise and 19 percent in value compared with 1948. California was the principal producer in 1949, followed by Oklahoma, Kansas, and Missouri, in that order. The average unit value decreased 6 cents to $0.81.

MARKETS

The principal use of crushed stone is as aggregate in concrete for both highway and building construction. It is natural, therefore, that crushed-stone sales should follow the trends of Portland-cement shipments, the area of new concrete pavements, and the value of new construction. These relationships are shown in figure 3.

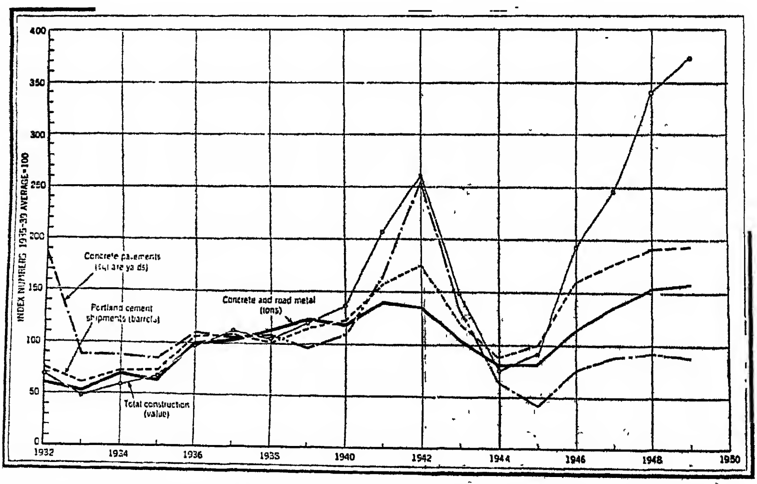

FIGURE 3.—Crushed-stone aggregates (concrete and road metal) sold or used in the United States compared with shipments of Portland cement, total construction (value), and concrete pavements (contract awards, square yards), 1932–49. Data on construction and concrete pavements from Survey of Current Business.

[1] Includes stone used for agriculture, asphalt filler, fill material, refractory, road base, roofing granules, spalls, and unspecified uses.
[2] Included with "Undistributed."
[3] Chats; figures collected by Denver, Colo., office of the Bureau of Mines. Kansas and Missouri figures also include stone.

The metallurgical industries in 1949 operated at a lower level than in 1948. Pig-iron production of 53 million short tons was 11 percent below the previous year's total; and steel production—78 million tons—was 12 percent below that of 1948. As a result of these decreases, metallurgical stone sales in 1949 were off 13 percent. The correlations of fluxing-stone output with pig-iron production and of refractory stone with steel-ingot production are shown in figure 4.

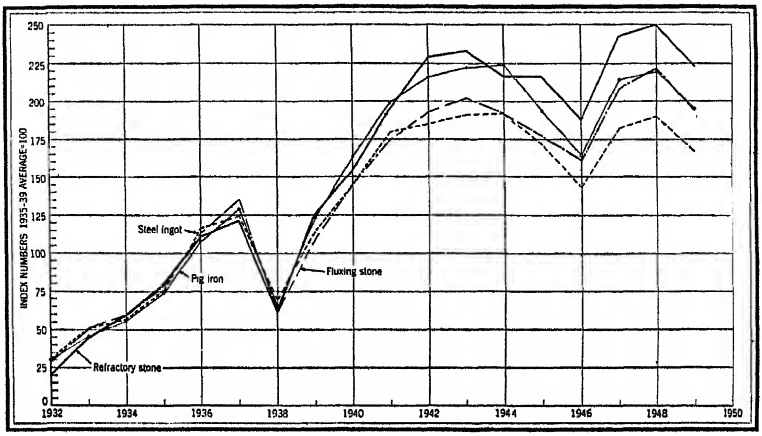

FIGURE 4.—Sales (tons) of fluxing stone and refractory stone (including that used in making lime) compared with production of steel ingot and pig iron, 1932–49. Statistics of steel-ingot production compiled by American Iron and Steel Institute.

TECHNOLOGY

The use of "skull breakers" continues to hold the attention of stone operators. Their performance in granite and limestones recently has been reviewed in the literature.[7]

Numerous articles describing thermic rock drilling (jet piercing) have appeared in the trade journals. According to one report, this type of drilling is accomplished by directing a jet of flame against the rock surface. A petroleum-base fuel, oxygen, and a special blowpipe are used. The intense heat of the flame causes the solid rock to disintegrate, and the pressure of the burning gases forces the spalled particles past a water spray in back of the blowpipe burner. This in turn enables the hardened-steel blades on the revolving "hole sizer" to drill through the embrittled rock. The steam, in combination with gas pressure, forces the rock chips out of the hole.[8]

Rock blasting by "timed delays" and "multiple-jet" shaped charges have been reported as having possibilities. According to one report, if explosions are timed to follow one another at split-second intervals, improved breakage, less vibration, and less noise result.[9] The principle of jet-shaped charge is similar to that used in the "bazooka" weapon. Details of the method have been described in the literature.[10]

As in the past few years, the problem of alkali-aggregate reactivity continued to hold attention of the industry. Results of research and various reports on this important phase of aggregates, as applied to concrete, have been reported by technical societies and in the literature.[11]

A method for determining the quantity of soft particles in coarse aggregates, by using a brass rod at a certain hardness, has been established by the American Society for Testing Materials.[12]

A stone plasticizer (Canadian Patent 444,434) containing ethylcellulose to be used for decorating and protecting artificial and natural stone has been announced.[13] Two reports have been released by the Bureau of Mines, one on the properties of various mine rock [14] and another on a travertine deposit in Washington.[15]

FOREIGN TRADE [16]

The importation of stone into the United States in 1949 increased slightly in value compared with 1948. The greatest gain, from the standpoint of value, was made by marble, although "other" stone also made a sizable increase in total value. Values of importations of granite, quartzite, and travertine decreased below the 1948 level.

The export trade in 1949, covering marble and other building and monumental stone, decreased about a third from the 1948 value, but "other manufactures of stone" increased slightly in value.

Sulfur and Pyrites

By G. W. Josephson and M. G. Downey [1]

GENERAL SUMMARY

WORLD-WIDE demand for sulfur continued at a high level in 1949. Production of native sulfur in the United States and for the world as a whole was nearly as high as in 1948. Output of native sulfur in Italy was still handicapped by high production costs, and therefore relatively little progress was made during the year. World demand for American native sulfur again exceeded the capacity of the mines, and stocks continued to decline.

Preference of consumers for native sulfur has in some degree hindered expansion of pyrite output in certain foreign countries as well as in the United States. However, world pyrite production in 1949 recovered to approximately the prewar level.

Salient statistics of the sulfur industry in the United States, 1935–39 (average) and 1946–49

	1935–39 (average)	1946	1947	1948	1949
Sulfur:					
Production of crude sulfur..long tons..	2,175,057	3,859,642	4,441,214	4,869,210	4,745,014
Shipments of crude sulfur—					
For domestic consumption..do....	1,420,236	2,939,140	3,529,043	3,715,999	3,358,395

Price of imported pyrites c. i. f. Atlantic ports, cents per long-ton unit..	12–13	14	15	15	15
Sulfuric acid: Production of byproduct sulfuric acid (basis, 100 percent) at copper and zinc plants..short tons..	564,794	716,216	725,197	641,445	573,276

A noteworthy development during the year was the growing consideration being given both by producers and consumers to reserve problems. Consumption has become so great that serious efforts are being made to broaden the base of mineral reserves on which the industry rests. This may be accomplished through the numerous native-sulfur exploration programs in progress or by bringing in higher-cost sources of supply.

Sulfur prices were stable during 1949.

[1] Figures on imports and exports compiled by M. B. Price and E. D. Page, of the Bureau of Mines, from records of the U. S. Department of Commerce.

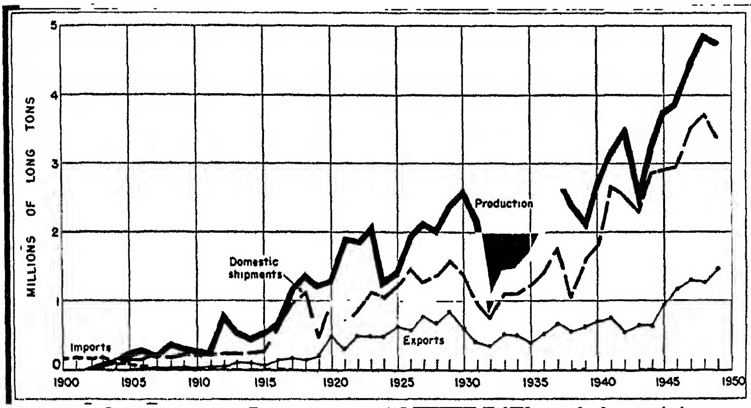

FIGURE 1.—Domestic production, shipments for domestic consumption, exports, and imports of crude sulfur, 1900–49.

SULFUR

DOMESTIC PRODUCTION

The domestic sulfur industry produced 4,745,014 long tons of native sulfur from Frasch-process mines during 1949, less than 3 percent under the record established in 1948. Demand from both domestic and foreign consumers was greater than this high production rate could satisfy, and shipments from the mines totaled 4,789,311 long tons. In addition to the Frasch sulfur, a total of 5,678 long tons of sulfur ore was produced by conventional mining methods in California, Colorado, Nevada, and Wyoming. In general, this material does not reach a high state of refinement and is consumed principally in treating alkaline soils.

Of the native sulfur produced in the United States in 1949, Texas contributed 76 and Louisiana about 24 percent.

California.—The only sulfur reported from California in 1949 was produced by Roy E. Kitching, who operated the Crater claims in Inyo County. The Siskon Mining Corp. reported that the Leviathan mine was idle.

Colorado.—The General Agricultural Products Co. produced sulfur ore at its mine in Delta County, Colo., during the first half of the year. The mine was leased to and operated by B. E. Warren during the latter part of the year.

Louisiana.—A new record was established in 1949 for sulfur output in Louisiana. A total of 1,134,185 long tons was produced by the Freeport Sulphur Co. from the Grande Ecaille mine.

Nevada.—W. S. Peterson operated the Streeter mine in Humboldt County, Nev. The organization of the Nevada Sulphur Co. was changed in 1949, but no output was reported from its property in Humboldt and Pershing Counties.

Texas.—Sulfur was produced in Texas by the following firms in 1949: Duval Texas Sulphur Co., at Orchard Dome, Fort Bend County; Freeport Sulphur Co., at Hoskins Mound, Brazoria County; Jefferson

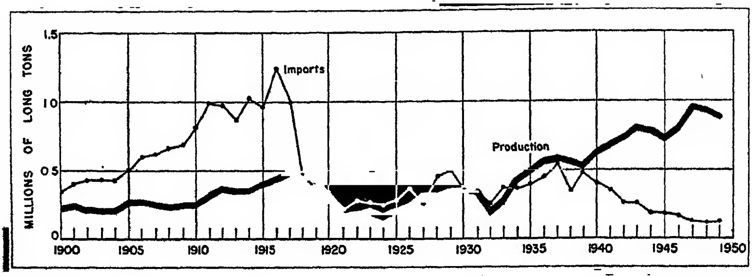

FIGURE 2.—Domestic production and imports of pyrites, 1900–49.

Sulfur produced and shipped in the United States, 1945–49 [1]

Year	Produced (long tons)			Shipped	
	Texas	Louisiana	Total	Long tons	Approximate value
1945	2,969,778	783,410	3,753,188	3,833,294	$61,300,000
1946	2,975,472	884,170	3,859,642	4,128,212	66,100,000
1947	3,561,214	880,000	4,441,214	4,828,103	85,200,000
1948	3,867,545	1,001,665	4,869,210	4,978,912	89,600,000
1949	3,610,829	1,134,185	4,745,014	4,789,311	86,200,000

[1] In addition to the refined sulfur shown, native sulfur ore (10–70 percent S) for agricultural use was produced in Colorado in 1945–49, in California and Nevada in 1946–49, in Texas in 1945–48, and in Wyoming in 1949. Total shipments of this material were as follows, in long tons: 1945—1,615 ($12,170); 1946—6,344 ($95,531); 1947—4,303 ($65,124); 1948—1,700 ($30,220); 1949—5,392 ($101,991).

Sulfur produced in Texas in 1949, by companies, in long tons

Company	First quarter	Second quarter	Third quarter	Fourth quarter	Total
Texas Gulf Sulphur Co.	716,393	701,866	685,630	693,539	2,797,428
Freeport Sulphur Co.	86,300	90,695	81,290	83,695	341,980
Jefferson Lake Sulphur Co., Inc.	56,197	70,422	69,182	54,765	250,566
Duval Texas Sulphur Co.	69,625	67,240	47,230	36,760	220,855
Total	928,515	930,223	883,332	868,759	3,610,829

Lake Sulphur Co., Inc., at Clemens Dome, Brazoria County, and at Long Point Dome, Fort Bend County; and Texas Gulf Sulphur Co., at Boling Dome, Wharton County, and at Moss Bluff Dome, Liberty County. The Pecos Orla Sulphur Co. reported no production from its Michigan claims in Culberson County during the year.

The Moss Bluff Dome was put into production by the Texas Gulf Sulphur Co. in 1948 and operated continuously throughout 1949, though it was reported that difficulties resulted in an output lower than anticipated.

Exploration wells were drilled by Texas Gulf Sulphur Co. at the Spindletop Dome in Texas.[2] Shipping facilities at Galveston were expanded.[3]

Output from Clemens Dome was greater in 1949 than in 1948. This dome has been in production for 13 years, and new reserves that have

[2] Texas Gulf Sulphur Co., Annual Report, 1949.
[3] Manufacturers Record, vol. 118, No. 10, October 1949, p. 52.

been found are expected to support a production rate of 75,000 tons during 1950. Extension of the life of this property is attributed to effective application of the mudding process. Exploration at Long Point Dome has proved sufficient reserves to indicate a 10- to 12-year productive life at this location.[4]

The Markham Dome in Matagorda County, Tex., was explored with three test wells by the Jefferson Lake Sulphur Co., but, as no sulfur mineralization was found, exploration was discontinued.[5]

Wyoming.—Sulfur ore was produced by Wyoming Mineral Products Co. near Cody in Park County; by Star Valley Mines, Inc., at Afton in Lincoln County; and by the Cody Sulfur Co. at Cody in Park County.

RECOVERY AS BYPRODUCT

At present the major sulfur supplies in the United States come from the native sulfur deposits mentioned in the previous section, with the pyrites mined as the primary product at a number of locations in the United States or imported from abroad second in importance. In addition to this direct production of sulfur minerals, substantial quantities of surfur are recovered as byproducts of other operations.

In the beneficiation of copper, zinc, and lead ores, large tonnages of byproduct flotation concentrates are recovered. Similarly, a relatively small quantity of coal brasses are obtained from washing midwestern coals in which the pyrite content is high and concentrated in thick seams. The statistics of these byproduct pyrites are included in the pyrites section of this chapter.

Large quantities of sulfur-bearing gases are released in the smelting of metal sulfide ores. As such gas is an expensive nuisance in the vicinity of the smelter and as in some locations it can be marketed profitably in the form of sulfuric acid, a substantial quantity of sulfur is recovered in this form. In 1949 the equivalent of about 167,000 long tons of sulfur (187,000 in 1948) was obtained as sulfuric acid from metal smelting plants. The following table shows the output of acid at smelters during the past 5 years. Full use of all the available smelter gas is not yet profitable. Total recovery has declined somewhat in recent years.

Sulfur fumes also are evolved in the course of many other industrial operations, but in most instances the quantity available at a single plant is too small to allow economic recovery. However, there is growing interest in the recovery of sulfur from gases. This interest was shown in numerous technical articles, in development and research programs being conducted by private firms, and in a number of actual commercial or semicommercial plants being built. The trend has been due partly to the attention being given to smog problems in cities and in part to the prospect of profitable recovery.

A major source of byproduct sulfur is the sour natural gas that occurs in various oil fields. A substantial quantity of elemental sulfur is now being recovered from sour gas, and the quantity is expected to increase considerably in future. During 1949 one new plant, that of the Stanolind Oil & Gas Co., was put into production in Wyo-

[1] Includes sulfuric acid produced as byproduct at a lead smelter.

ming; and another, a 300-ton-per-day unit at Worland, being built by the Texas Gulf Sulphur Co. to use sour gas furnished by the Pure Oil Co., was nearing completion. The Hancock Chemical Co.[6] began treating oil-refinery gases at a new plant in the Los Angeles area and expansion was already under way. The sulfur is used at a nearby acid plant. The Freeport Sulphur Co. constructed a plant near Westville, N. J., to recover elemental sulfur from refinery gases of the Texas Co. This plant was slated to be in operation early in 1950. The Mathieson Chemical Corp. purchased the Southern Acid & Sulphur Co., which operates two elemental sulfur-recovery plants using Arkansas sour gas.[7]

In 1949, 56,781 long tons of elemental sulfur (calculated as 100 percent sulfur) were recovered in 11 States from coke-oven, refinery, natural, and other industrial gases by the Thylox, Sasco, and other processes. Shipments totaled 42,268 long tons; 94 percent was sold in the form of brimstone and the remainder as paste containing 40 to 52 percent sulfur. In addition, 44,369 tons of hydrogen sulfide (containing 37,935 long tons of sulfur) were recovered in 1949 in four States by the Phosphate, Girbotol, and other processes.

CONSUMPTION AND USES

As shown in the accompanying table, both apparent domestic consumption and apparent shipments to consumers (apparent sales)—a calculated figure that includes exports—were somewhat lower than in the record year 1948. Apparent consumption declined 8 percent and apparent domestic sales 3 percent.

Apparent consumption of sulfur in the United States, 1945–49, in long tons

	1945	1946	1947	1948	1949
Shipments to consumers (apparent)	3,849,591	4,094,191	4,839,548	5,015,230	4,870,723
Imports	33	35	15	38	32
Total	3,849,624	4,094,226	4,839,563	5,015,268	4,870,755
Exports:					
Crude	918,691	1,189,072	1,299,060	1,262,913	1,430,916
Refined	23,971	56,748	50,477	32,630	30,051
Total	942,662	1,245,820	1,349,537	1,295,543	1,460,967
Apparent consumption	2,906,962	2,848,406	3,490,026	3,719,725	3,409,788

[6] Chemical Industries, Sulfur from Refinery Gas: Vol. 65, No. 6, December 1949, p. 898.
[7] Chemical Engineering, vol. 56, No. 3, March 1949, pp. 76–78.

The pattern of sulfur consumption by industries, as estimated by Chemical Engineering, is shown in the following table. These estimates show a general reduction in consumption in nearly all uses and a total decline in 1949 of about 5 percent below 1948, somewhat smaller than indicated in the calculation of apparent consumption. The difference can be explained, at least in part, by variation in consignment shipments and consumers' stocks from year to year.

Sulfur consumed in the United States, 1945–49, by uses, in long tons

[Chemical Engineering]

Use	1945	1946	1947	1948	1949
Chemicals [1]	1,605,000	1,460,000	1,760,000	1,790,000	1,765,000
Fertilizers and insecticides	600,000	620,000	740,000	800,000	740,000
Pulp and paper	297,000	305,000	370,000	380,000	330,000
Explosives [1]	90,000	90,000	100,000	110,000	98,000
Dyes and coal-tar products	75,000	80,000	95,000	98,000	94,000
Rubber	58,000	65,000	65,000	63,000	53,000

Food products	7,000	7,000	8,000	8,000	8,000
Miscellaneous	135,000	175,000	212,000	211,000	202,000
Total	2,961,000	2,907,000	3,540,000	3,700,000	3,500,000

[1] To avoid disclosing estimated consumption of sulfur in direct war applications, such as military explosives, sulfur so used is included with "Chemicals."

Sulfur in elemental form is consumed in substantial tonnages in the manufacture of rubber, insecticides, and other products. A large tonnage is also converted into various other sulfur compounds for use in making such products as paper pulp. However, the largest fraction—about three-fourths of the total annual consumption—is converted into sulfuric acid.

As shown in the accompanying table, compiled by Chemical Engineering, sulfuric acid has extremely wide utility in industry.

Sulfuric acid (basis, 100 percent) consumed in the United States, 1945–49, by industries, in short tons

[Chemical Engineering]

Industry	1945	1946	1947 [1]	1948 [1]	1949

[1] Revised figures.

[2] To avoid disclosing estimated consumption of acid in direct war applications, such as military explosives, acid so used is combined with "Chemicals."

In 1949 sulfuric acid consumption declined about 1 percent, and the reduction is estimated to have been well distributed over the entire field of consumption.

As such a large fraction of the total sulfur consumption goes into sulfuric acid, some conception of the location of sulfur markets may be obtained from the accompanying table of sulfuric acid production compiled from reports of the Bureau of the Census.

Production of new sulfuric acid (100 percent H_2SO_4), by regions and by States, 1947–49

[8] Includes processing plants as follows: 1947—82 contact units, 85 chamber units, and 10 plants operating both types of units; 1948—91 contact units, 85 chamber units, and 9 plants operating both types of units; 1949—94 contact units, 83 chamber units, and 10 plants operating both types of units.

The role and value of sulfur in soil fertility were the subjects of a symposium.[8] The use of sulfur in the ceramics industry was outlined,[9] and a brief publication on sulfuric acid was issued by the United States Department of Commerce.[10]

STOCKS

On December 31, 1942, the combined total of all producer-owned stocks was reported to be 5,114,000 long tons. This included stocks held at the mine, in transit, and at various other locations. Of the total, 4,300,000 tons were in stock at the mine. Since that date stocks have declined steadily, as demand has consistently exceeded supply. At the end of 1949 the total producers' stocks had been reduced to 3,099,305 long tons, of which 2,650,152 long tons were at the mines.

PRICES

The price of crude sulfur remained at $18 per long ton f. o. b. mines for the domestic market and $22 f. o. b. Gulf ports, for export, throughout 1949.

FOREIGN TRADE

As shown in the accompanying table, the United States imports little or no crude sulfur. However, small quantities of sulfur ore are reported to be imported from Mexico into southern California for use in treating soil.

Exports, on the other hand, which averaged about 583,000 long tons in 1935 to 1939, have increased until a record total of 1,460,967 tons was reached in 1949.

Gulf coast sulfur is the preferred raw material in most areas throughout the world both for quality and price reasons. The accompanying table shows the wide distribution of American sulfur in the world market.

Sulfur imported into and exported from the United States, 1945–49

[U. S. Department of Commerce]

Year	Imports				Exports

WORLD REVIEW

As shown in the accompanying table, native sulfur is produced in a considerable number of countries; but individual output generally is comparatively small, and most of the production is concentrated in a few countries. The bulk of the tonnage comes from dome deposits that can be mined by the Frasch process in the Gulf Coast area of the United States. It is estimated that in 1949 the world output of native sulfur approximated 5,200,000 long tons—a tonnage nearly as great as the record established in 1948. The trend noted in recent years toward increasing use of elemental sulfur from sources other than natural sulfur deposits is continuing. The tonnage obtained from such operations is already quite appreciable. It is estimated that the total world sulfur production, including elemental sulfur derived from other sources as well as native sulfur, approximated 5,400,000 long tons in 1949.

World production of native sulfur, by countries,[1] 1944–49, in long tons

[1] Native sulfur believed to be produced also in China (continental), Cuba, Egypt, Guatemala, India, Indonesia, Iran, Israel-Jordan, and U. S. S. R., but complete data are not available; estimates by senior author of chapter included in total.
[2] Estimate.
[3] Data not available; estimate by author of chapter included in total.
[4] In addition, 32,025 tons of sulfur rock were reported in 1944. Similar data not available for later years.
[5] Incomplete data.

Bolivia.—Bolivia produces a few thousand tons of sulfur annually, principally for export. Sulfuric acid requirements of Bolivia are small, but it was reported that a new sulfuric acid plant to supply the most essential needs was completed in 1949.[11]

China (Formosa).—Before World War II there were about 15 producing mines in the Taipei-Keelung area. During the war the mines continued to operate, but the production figures are not precise. Prewar exports, as reported by the prewar operator of the mines, are said to have been about 100 tons monthly to Shanghai, total production being apparently of the order of 150 tons monthly. Current production was estimated to be 200 to 300 tons monthly, some portion of which was being exported before October 1948, when exports were prohibited by the Provincial Government. Local consumption

[11] Chemical and Engineering News, Bolivian Sulfuric Acid Plant: Vol. 27, No. 28, July 11, 1949, p. 2018.

requirements exceed production capacity. The deposits were said to be small and scattered, the ore containing 20 to 80 percent sulfur. Processing equipment is said to consist of large cast-iron pans, in which the ore is heated, and distillation apparatus to draw off the sulfur.[12]

Colombia.—It was reported that Industrias Purace is exploiting a 6,000,000-ton deposit of sulfur on the Purace Volcano in Cauca Department, Colombia.[13]

France.—The Société Languedocienne de Recherches et d'Exploitations Miniéres is producing native sulfur in southwestern France from a deposit that is relatively lean but is located advantageously with regard to the market, particularly the grape industry. Before 1949 the product commonly contained 10 to 30 percent sulfur, which served as a reasonably satisfactory insecticide and fungicide; but, as a higher-quality material was in demand, improved beneficiation processes have been installed. New flotation and milling methods are being applied to beneficiate the product, and it was reported that purities of 90 and 97 percent were being achieved. The product is comparatively expensive, but the company anticipates that its costs will be reduced to a point that will make it competitive with foreign sulfur in the not too distant future.

Italy.—Italy's mining industry is easily able to supply domestic consumption requirements, which are increasing, and also provide a large exportable surplus of sulfur. As the Italian producers of native sulfur are using methods that are expensive as compared to the Frasch process, they are at a serious disadvantage in the world market; consequently, the Italian sulfur industry has been in a depressed condition in recent years. The industry is subsidized to some degree by the Government, and special efforts are made by a central marketing organization to market production, particularly that from Sicily, in foreign countries. For example, it was reported in the press that the organization contracted to ship 6,000 metric tons of refined sulfur to Greece in exchange for tobacco; that France had agreed to take 30,000 tons of crude sulfur, paid for within the framework of the French-Italo clearing agreement; and that 7,000 metric tons of crude sulfur went to Soviet Russia.[14]

During 1949 Italian sulfur production apparently increased moderately but stocks were large.

Some efforts are being made to improve the mining practices, which in many instances are very primitive, and also to introduce better beneficiation methods. Arrangements have been made for installing a pilot plant designed to beneficiate sulfur by flotation. It is anticipated that this method will be more efficient than the methods now practiced. The experiment is being carried on at the Cozzo Disi mine, and construction was scheduled for completion in 1950. If it is successful, the method could be applied at a number of Sicilian mines where adequate water and power are available. In 1949 it was said that the price of Italian sulfur was of the order of $45 to $50 a ton, considerably above the delivered cost of American sulfur in the

[12] Scott, George, Consular Rept. 5, Taipei, Formosa, March 30, 1949.
[13] Engineering and Mining Journal, vol. 150, No. 12, December 1949, pp. 130–131.
[14] Oil, Paint and Drug Reporter, vol. 155, No. 12, March 21, 1949, p. 43.

European area. The aim, therefore, is to reduce costs by 50 percent or more to improve the competitive position.

A Government decree dated July 9, 1949, established the following prices to be paid for sulfur placed by producers at the disposal of Ente Zolfi Italiani: Superior Yellow, 34,800 lire ($60.52); Inferior Yellow, 33,900 ($58.95); Good, 33,000 ($57.39); and Ordinary, 32,400 ($56.34). These figures were higher than those established a year previously because of rising production costs.[15]

During the year there were reports that sulfur producers in Sicily felt that special commercial arrangements enabling them to compete in various markets would be desirable, but in the United States the Sulphur Export Corporation denied that such an agreement with Italian sulfur producers was contemplated.

Japan.—Installation of sulfuric acid plants that would recover sulfur compounds from sinter gases was planned by the Nippon Mining Co. Hitachi and Saganoseki copper smelters, Dowa Mining Co. Kosaka smelter, Mitsubishi Mining Co. Osarizawa smelter, and others.[16]

Mexico.—The sulfur industry was very active in Mexico in 1949. Actual mining of sulfur (from shallow deposits) was very small, but several companies were conducting exploration programs in an attempt to locate domes that could be mined by the Frasch method.

The Gulf Sulphur Co. de Mexico, S. A., an affiliate of the Pan American Sulphur Co., conducted an extensive drilling program in the vicinity of Jaltipan, Vera Cruz.

The Mexican Gulf Sulphur Co. drilled the San Cristobol Dome in the State of Vera Cruz, Mexico, and the drilling record was being analyzed by the Jefferson Lake Sulphur Co. under an agreement between the two companies.[17]

Cia Exploridora de Istmo, a Mexican subsidiary of the Texas Gulf Sulphur Co., entered into an agreement with the Republic of Mexico which grants exploitation and mining rights in the State of Vera Cruz. Geophysical and surveying operations were begun as a preliminary to the selection of areas for exploratory drilling.[18]

Turkey.—A new shaft has been sunk to the ore body at the Keciburlu sulfur mine in Turkey. The deposit is said to be very large.

PYRITES

DOMESTIC PRODUCTION

Pyrites production in the United States declined slightly—4 percent in 1949—but, as shown in the accompanying table, it remained close to record levels.

The price and quality of native sulfur produced in the United States are such that, to compete, pyrites must have local advantages such as low shipping costs of either the raw material or the acid product. Virtually all of the pyrites produced in the United States is converted into sulfuric acid, much of it by the producing companies themselves. In 1949, producing companies consumed 726,777 long tons in acid manufacture and sold 141,484 long tons.

Pyrites (ores and concentrates) produced in the United States, 1945–49

Year	Quantity		Value	Year	Quantity		Value
	Gross weight (long tons)	Sulfur content (percent)			Gross weight (long tons)	Sulfur content (percent)	
1945	722,596	41.0	$2,700,000	1948	928,531	41.8	$3,950,000
1946	813,372	41.5	3,228,000	1949	888,388	42.6	3,904,000
1947	940,652	41.7	4,070,000				

California.—The Hornet Mine of the Mountain Copper Co. produced a large tonnage of pyrites in Shasta County, Calif.

Colorado.—Output of pyrites in Colorado was reported by the Rico Argentine Mining Co., Dolores County; the Empire Zinc Division of the New Jersey Zinc Co., Eagle County; and Climax Molybdenum Co., Lake County. Production from the State totaled 13,877 long tons valued at $50,498.

Indiana.—A total of 559 tons of pyrites (coal brasses) was recovered by the Snow Hill Coal Corp. from its coal washer at its Tallydale mine, Vigo County, Ind.

Montana.—Production of byproduct pyrites at the copper-plant operations of Anaconda Mining Co., Anaconda, Deer Lodge County, increased sufficiently to make Montana the third-largest producing State in 1949.

New York.—Pyrites output at the Balmat mine of St. Joseph Lead Co. in St. Lawrence County, N. Y., increased during 1949.

Pennsylvania.—The Bethlehem Steel Co. produced pyrites at its concentrator in Lebanon County, Pa.

Tennessee.—Tennessee was again, by a wide margin, the leading pyrites-producing State. Production came from the mines of the Tennessee Copper Co. in the Ducktown area, Polk County. The pyrites concentrate was used by the company in the production of sulfuric acid and sinter.

Virginia.—The second-largest producing State in 1949 was Virginia. Output came from the Gossan mine of the General Chemical Division, Allied Chemical & Dye Corp., in Carroll County. The company uses pyrites from this mine for its sulfuric acid plant at Pulaski.

Wisconsin.—Recovery of pyrites is reported to have been discontinued by the Vinegar Hill Zinc Co.

PRICES

There is considerable variation in the f. o. b. mine prices of pyrites produced in the United States, because transportation costs and other local conditions vary considerably. The range in 1949 is reported to have been from less than $1.25 to about $6.00. The average value of total production was reported by producers to be $4.40. The average of the total sales was $5.23 per ton. Oil, Paint and Drug Reporter quoted Spanish pyrites at $8 per ton c. i. f. Atlantic ports. E&MJ Metal and Mineral Markets quoted nominal prices of Spanish pyrite at 14 to 16 cents per long-ton unit of sulfur delivered to United States ports.

Pyrites valuation is sometimes deceptive because of allowances made for recoverable nonferrous metal values in the ore. Sources in the industry estimate that Spanish pyrites was worth, for its sulfur content, approximately 15 cents per unit during 1949.

FOREIGN TRADE

The United States does not export pyrites, but historically it has been a substantial importer. However, in recent years imports have declined greatly; whereas in 1935–39 pyrites imports averaged 433,485 long tons, total receipts in 1949 were only 120,937. Spain, which before World War II was the major source of supply, sold less than 13,000 tons in the United States during 1949. Canada is now the principal source. Total imports, which had declined to 107,411 long tons in 1948, increased 13 percent in 1949.

The market for foreign pyrites is largely centered in the East; nearly the entire tonnage entered through the Buffalo and Philadelphia customs districts.

Pyrites, containing more than 25 percent sulfur, imported for consumption in the United States, 1945–49, by countries

WORLD REVIEW

Alhtough in the United States pyrite deposits are at present the secondary source of supply of sulfur, they occupy an important place in the world supply. World output declined during World War II; but, as shown in the accompanying table, the total has increased steadily since 1945 and is now back at about the prewar level. Reports

World production of pyrites (including cupreous pyrites), by countries,[1] 1945–49, in metric tons

[Compiled by Helen L. Hunt]

[1] In addition to countries listed, Belgium, Egypt, Hungary, India, Iran, Ireland, U. S. S. R., Uruguay, and Yugoslavia produce or have produced pyrites, but production data are not available; estimates by senior author of chapter included in total. South Korea had no production 1946 through 1949.

[2] Estimate.

[3] Data not available; estimate by author of chapter included in total.

[4] January to September, inclusive.

[5] British zone only.

[6] Bizonal area.

[7] Preliminary data for fiscal year ended March 31 of year following that stated.

from producing countries are not yet complete, but it is estimated that total world output of pyrites in 1949 approximated 10,500,000 tons.

Australia.—Australia is a substantial consumer of sulfur; and, as elemental sulfur must be imported from abroad, there has been a more or less continuous effort to supplant the imported material with domestically produced pyrites. During 1949 efforts were made to use a large tonnage of pyrites available in several dumps of Mount Morgan, Ltd., in Queensland.[19]

There has been a shortage of acid in Australia, and more capacity is to be installed. Before approval, however, the raw-material problem was being given serious consideration, even to the extent of investigating the possibility of using gypsum.[20]

The devaluation of Australian currency was another factor that hastened plans to utilize Australia's own sulfur resources and also increased efforts to obtain sulfur from "soft-currency" sources.[21]

Canada.—As shown in the world production table, Canada is a substantial producer of pyrites. Reserves of this mineral are believed to be large. For example, one zone of the Noranda mine is said to contain 100,000,000 tons of pyrites ore.[22] Canada has no commercial production of native sulfur; its imports of native sulfur from the United States generally exceed a quarter of a million tons annually. This is a substantial market, and various efforts are being made to serve it from local raw material.

Some sulfur compounds are recovered from smelter gases in British Columbia. A project for extracting liquid sulfur dioxide at Sudbury, Ontario, was reported.[23] An experimental project was underway at Noranda looking toward production of elemental sulfur and iron sinter from pyrites.

Germany.—Germany, as a highly industrialized country, requires large quantities of sulfur minerals. During World War II its needs were satisfied in part by expanding the output of pyrites, particularly at the Meggen mine, where production exceeded a million tons in 1943. After the war, pyrite production in Germany dropped sharply and then recovered somewhat. Output of pyrite in Bizonia is reported to have exceeded 380,000 metric tons in 1948, of which about 300,000 tons were contributed by Meggen. Imports of pyrites in that year totaled 461,874 metric tons, most of which came from Spain and Norway.[24] In 1949 German pyrite production increased to 430,495 metric tons.

Discovery of a new deposit of pyrites has been reported near Elbingerode in the Harz Mountains in the Soviet Zone. Early opening of the new deposit was expected because of a shortage of pyrites in that area.[25]

Italy.—Italy has again developed enough pyrites production to have an exportable surplus. It was reported that in 1948, 83,000 tons were exported out of a total production of 835,000.[26]

Norway.—A/S Grong Gruver has indicated that its ore reserves total at least 20,000,000 tons of pyrites. Other deposits in Norway are said to be somewhat uncertain, but it is estimated that, after 20 or 30 years, the Norwegian output of pyrites will decline. This estimate may be modified by the expected development of the Skorovas mine to an annual rate of 150,000 tons a year and the possibility of further successful exploration both in known deposits and new ones.[27]

An extensive development program is being carried out by the Killingdal Mines in central Norway. Because of operating difficulties underground, annual output of this mine has declined from 49,000 to 30,000 tons. With the installation of more adequate underground transportation, as well as new surface facilities, it was anticipated that output will again be raised to the previous level.[28]

Portugal.—Pyrite production in Portugal increased moderately during 1949, and the exports improved owing in part to better availability of shipping space. A large part of Portugal's exports go to France.[29]

Southern Rhodesia.—It was reported that, up to the end of 1948, 319,398 tons of pyrites had been mined from the Iron Duke mine in the Mazoe district, Southern Rhodesia, which is the only one worked solely for pyrites. The pyrites are sent to the sulfuric acid plant at Rhodesia Broken Hill in Northern Rhodesia.[30]

Spain.—The pyrites industry of Spain has not recovered from the decline entered during World War II, but there has been some progress by both the Government and producers in expanding the output of this important export commodity. During 1949 the industry found operations very difficult owing to a serious shortage of electrical power caused by drought, shortages of operating equipment, and increasing operating costs caused in part by monetary inflation and foreign exchange difficulties. However, in spite of these difficulties, the Tharsis Sulphur & Copper Co., Ltd., increased its pyrites exports to 513,576 tons—slightly more than in 1948. Total production in Spain increased to 1,132,793 tons in 1949 but was still far below the prewar normal.

United Kingdom.—It was reported that peak production of pyrites from colliery refuse totaled 25,000 tons per year. The pyrites contained 42 percent sulfur, 4 to 9 percent carbon, and 0.03 to 0.08 percent arsenic. It was blended with imported pyrites for burning in Herreshoff furnaces.[31]

Talc and Pyrophyllite

By Bertrand L. Johnson and F. M. Barsigian

GENERAL SUMMARY

MINE production of talc, pyrophyllite, and ground soapstone, and the quantity and value of these commodities sold or used, all decreased in 1949. (See fig. 1). Total imports were slightly higher in quantity in 1949 than in 1948, and considerably higher in value. Exports of crude and ground talc, steatite, soapstone, and pyrophyllite decreased in quantity and increased in value. Exports of talcum powders were again cut sharply, decreasing from $2,228,956 in 1948 to $1,633,046 in 1949.

[1] Includes pinite; none in 1949.
[2] Figure not available.
[3] Includes a small quantity of crushed material.
[4] Exclusive of "Manufactures, n. s. p. f., except toilet preparations," as follows: 1948: $14,772; 1949: $9,012. Quantities not available.
[5] Includes manufactures, n. e. s.

Attention was called to the great variability in the chemical and mineralogical composition of commercial talcs.[1]

PRODUCTION AND SALES

The quantity of domestic talc, pyrophyllite, and ground soapstone sold or used in 1949 (461,896 short tons, valued at $7,523,478) was much less, in both quantity and value, than in 1948 or in 1947, according to reports of the producers to the Bureau of Mines, and the 1948 figures remain the all-time highs.

Talc, pyrophyllite,[1] and ground soapstone sold by producers in the United States, 1945–49, by classes

Year	Crude [1]			Sawed and manufactured		
	Short tons	Value at shipping point		Short tons	Value at shipping point	
		Total	Average		Total	Average
1945	35,979	$367,488	$10.21	733	$182,904	$249.53

REVIEW BY STATES

In 1949 New York was still the leading producer by a large margin, North Carolina second, and California third. Sales in all the listed States except Nevada were lower in 1949 than in 1948. Sales of pyrophyllite, most of which comes from North Carolina, decreased markedly.

Talc, pyrophyllite, and ground soapstone, sold by producers in the United States, 1948–49, by States

State	1948		1949	
	Short tons	Value	Short tons	Value
California	98,681	$1,773,764	83,359	$1,434,046
Georgia	53,602	624,694	49,338	580,405

Total	518,746	8,265,363	461,896	7,523,478

[1] Includes pinite; no sales in 1949.
[2] Montana, Texas, and Washington.

California.—California talc deposits have been described in recent articles.[2] The principal talc resources of both California and Nevada are confined to a southeasterly trending belt, 200 miles long and 30 miles in average width, in southeastern California. A second talc- and soapstone-bearing belt comparable in size and trend to this lies within the western foothills of the Sierra Nevada. Commercial production has come principally from the southeastern belt, where both steatitic and tremolitic talcs occur. Production from the western area has been comparatively small.

Montana.—The talc deposits of Montana at present of commercial ranks lie in altered limestones of pre-Cambrian age in an area about 40 miles across between the Beaverhead and Madison Rivers in counties of the same names.[3] A small deposit occurs, however, in Cambrian rocks one mile south of Helena. Two talc mines have been operating in the former area—one on Axes Creek southeast of Dillon and one on Johnny Gulch south of Ennis. These and a deposit of pyrophyllite near Argenta, 12 miles northwest of Dillon, are described in the report.

New York.—An interesting paper on the New York talc deposits appeared in 1949.[4] These occur near Gouverneur in the northwestern part of the pre-Cambrian Adirondack Mountain massif. All are of pre-Cambrian age and occur in the highly deformed, recrystallized Grenville marble. In these so-called talcs the mineral talc is reported to be subordinate in quantity to other minerals present in the deposits, and in the Gouverneur district it comprises less than 25 percent of the mined and ground rock. Most of the rock mined is a tremolite or tremolite-anthophyllite schist somewhat altered to serpentine and talc. The Natural Bridge talcs include types high in serpentine, as well as complex aggregates of serpentine, talc, carbonates, and diopside. The approximate percentages of constituent minerals in various types of commercial talcs (industrial mineral aggregates) from the Gouverneur district are shown in one table, and the chemical analyses of industrial talcs mined in New York State in another. The geology of the deposits, the mining and milling methods, and uses of these New York talcs are also discussed in this article.

Texas.—Extensive deposits of soapstone and impure talc occur in the pre-Cambrian rocks of the Llano uplift area in central Texas. These are in the Packsaddle schists which surround the granites. Current operations are confined to producing finely ground soapstone for roofing paper coatings and as an ingredient in oil-well drilling muds. A relatively small percentage of this material might be advantageously used as a fluxing agent to reduce firing temperatures in

the production of heavy clay products.[5] Also, preliminary beneficiation tests indicate that a feasible concentrate of higher-quality talc from these deposits will burn to a more nearly white color. The Alfred Davis soapstone deposits in Gillespie County have been investigated by the Bureau of Mines.[6] In May and June 1947 two holes were core-drilled. Geographic and topographic maps, vertical sections and logs of the diamond-drill holes, and a table of analyses of samples, as well as a brief description and history of the property are included in the report.

Washington.—The talc, soapstone, and pyrophyllite deposits of Washington are described in two recent publications.[7]

CONSUMPTION AND USES

Six industries—paint, ceramics, rubber, insecticides, roofing, and paper—consumed 82 percent of the sales of domestically produced talc, pyrophyllite, and ground soapstone in 1949, according to reports from the producers. Decreases were reported in all of these leading industries from 1948. Sales for the minor uses listed—toilet preparations, foundry facings, and crayons—showed increases. The paint industry was the leading consumer, with 22 percent of the total; ceramics, with 20 percent, was second.

Talc, pyrophyllite, and ground soapstone sold by producers in the United States, 1948–49, by uses [1]

Use	1948		1949	
	Short tons	Percent of total	Short tons	Percent of total
Paint	108,505	21	100,097	22

PRICES

The average value per ton of domestic talc, pyrophyllite, and ground soapstone sold (or used by producers) rose from $15.93 in 1948 to $16.29 in 1949, an increase of 36 cents a ton.

Prices of ground talc and pyrophyllite, quoted by the Oil, Paint and Drug Reporter for weeks near the beginning, midyear, and end of 1949, are shown in the following table:

Prices quoted on talc and pyrophyllite, carlots, 1949–50, per short ton

[Oil, Paint and Drug Reporter]

[1] Not quoted.
[2] In paper bags, $3 to $3.50 per ton extra.

FOREIGN TRADE [8]

Imports.—Increases occurred in 1949 over 1948 in both quantity and value of total unmanufactured talc, steatite or soapstone, and French chalk imported for consumption in the United States—439 short tons in quantity and $58,289 in value, but imports of manufactures (n. s. p. f. except toilet preparations) declined in value from $14,772 in 1948 to $9,012 in 1949. As usual, the greater part of the unmanufactured imports was of the "ground, washed, powdered or pulverized, except toilet preparations" material. Most of the ground material came from Italy, with Canada in second place and France third. The manufactures came chiefly from China.

Imports of block steatite talc from India and Italy, both "crude" and "cut and sawed," partly satisfied the demand for block steatite talc, needed for the production of insulating materials in electronic apparatus by industry and for stockpiling by the Government. Stockpiling of imported block steatite talc for this purpose remains necessary because known domestic reserves of this type of talc are

[8] Figures on imports and exports compiled by M. B. Price and E. D. Page, of the Bureau of Mines, from records of the U. S. Department of Commerce.

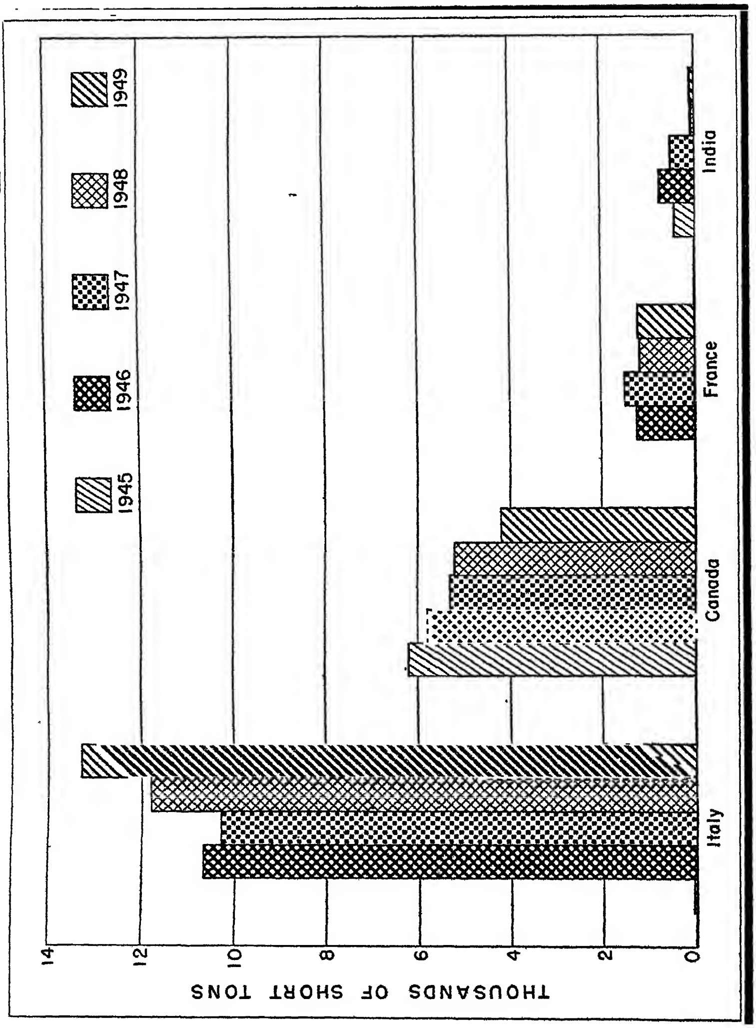

FIGURE 2.—Unmanufactured talc, steatite or soapstone, and French chalk imported for consumption in the United States, 1945–49, by principal countries.

negligible and current production none and because it has not been satisfactorily shown that compressed ground steatite, of which the domestic supply is sufficient, can replace the block talc currently used for certain types of insulators. Preparations are in progress for comparative tests of electronic spacers made from both types of steatite by the United States Signal Corps, Rutgers University, and industry.

Talc, steatite or soapstone, and French chalk imported for consumption in the United States, by classes in 1945–47, and by classes and countries in 1948–49

[1] Less than 1 ton.

Exports.—The quantity of "talc, steatite, soapstone, and pyrophyllite, crude and ground" exported from the United States in 1949 dropped 487 short tons from 1948. The value of these exports, however, increased $7,510 to $439,686, a new record. The value of the exports of "powders—talcum (in packages), face and compact" decreased over half a million dollars ($595,910) in 1949 from the 1948 value.

Talc, pyrophyllite, and talcum powders exported from the United States, 1945–49

[U. S. Department of Commerce]

Year	Talc, steatite, soapstone, and pyrophyllite				Powders—talcum (in packages), face and compact (value)
	Crude and ground		Manufactures, n. e. s.

[1] Not separately classified before January 1949.
[2] Excludes 599 short tons, valued at $30,589, sent to Japan under the Army Civilian Supply Program.

TECHNOLOGY

Several articles on the technology of talc have been published recently.[9] Of especial interest is the following statement by Bowen and Tuttle regarding the composition of talc, as shown by their studies in preparing synthetic talc:

> A number of chemical analyses of supposed talc in the literature have suggested to some investigators that talc can vary in composition, but present indications are that the materials examined were mixtures. In any case in our synthetic preparations, if we use a slight amount of silica over that indicated by the accepted formula, some free silica is present with the talc and if we use a slight excess of MgO some forsterite appears with the talc at 525° C. and 15,000 lb./in^2. Our work, therefore, does not support the concept of variability in the composition of talc and shows that the ratio of MgO and SiO_2 is that of the accepted formula ($3MgO \cdot H_2O \cdot 4SiO_2$). The water content is also in accord with that formula, analysis of our product showing 4.6 percent H_2O. The theoretical value is 4.75 percent.

A radio tube, reportedly superior to glass in producing small radio waves, has been developed by the General Electric Co. through using steatite for the tube body.

WORLD REVIEW

The production of talc, pyrophyllite, and ground soapstone in various countries in recent years is shown in the accompanying table.

[1] In addition to countries listed, talc or pyrophyllite is reported produced in Brazil, Bulgaria, French Morocco, Pakistan, Tanganyika, and U. S. S. R., but data on production are not available; no estimate included in total.
[2] Data not available; estimate by author of chapter included in total.
[3] American zone only.
[4] Bizonal area.
[5] Incomplete.
[6] Less than 1 ton.
[7] Includes steatite as follows: 1942: 24,859; 1943: 9,741; 1944: 7,369; 1945: 15,577; 1946: 19,541; 1947: 20,835; 1948: 18,627; 1949: 20,880.
[8] Talc, pyrophyllite, pinite, and ground soapstone sold by producers.

Canada.—Preliminary reports show[10] that in 1949 Canada produced 13,500 short tons of talc (value $135,000) and 14,276 tons of soapstone ($123,599). Imports of talc and soapstone were given as 7,022 tons ($217,994) and exports of talc 3,854 tons ($49,357).

The Canadian talc and soapstone industry in 1948 was described as follows:[11]

> Canadian producers of talc and soapstone shipped 28,780 tons valued at $309,823 during 1948. Operators in Quebec, all in the Eastern Townships, shipped 14,479 tons of block and ground material worth $145,361 and shipments from Ontario totaled 14,301 tons valued at $164,462; the latter tonnage was mostly high-grade milled talc. The 5 concerns in this industry employed an average of 58 persons during the year.

[10] Canada, Department of Trade and Commerce, Dominion Bureau of Statistics, Preliminary Report on Mineral Production, 1949: Prepared in the Mining, Metallurgical and Chemical Section of the Industry and Merchandising Division, Dominion Bureau of Statistics, Ottawa, Canada (see p. 36).
[11] Canada, Department of Trade and Commerce, Dominion Bureau of Statistics, The Talc and Soapstone Industry in Canada, 1948: Industry and Merchandising Division, Mining, Metallurgical and Chemical Section, Ottawa, Canada, 1949, 4 pp.

Canadian consumers imported 7,798 tons of talc or soapstone valued at $213,438 in 1948. Exports totaled 5,052 tons worth $63,474.

Ground talc, including soapstone and pyrophyllite, is used chiefly in the paint, roofing, paper, rubber, insecticide, and ceramic industries. It is used also in foundry facings, bleaching fillers for textiles, cosmetics and pharmaceuticals, soaps and cleansers, plaster, polishes, plastics, and for rice polishing. Soapstone is used extensively in the form of sawn blocks and bricks for lining the alkali recovery furnaces and kilns of kraft pulp and paper mills. It is used for brick and slab liners for fireboxes, stoves, and ovens, and for switchboard panels, laboratory benches, etc. Considerable quantities of soapstone quarry and sawing waste are ground and used as low-grade talc in the rubber, roofing, foundry, and other trades. Compact, massive talc, sawn into square pencils and slices, is an important material for steelmakers' crayons. Recent shortages of suitable raw material have led to the introduction of extruded crayons compounded of ground talc with a suitable binder.

Tin

By Samuel A. Gustavson and John B. Umhau

GENERAL SUMMARY

WITH adequate supplies of tin for industry, governmental controls in effect for a decade were removed or relaxed in 1949. International allocation was discontinued and tin trading on metal exchanges was resumed.

World mine output of tin increased 8,900 long tons (6 percent) in 1949 over 1948. Most of the gain was in Malaya and Thailand, where output expanded 23 and 84 percent respectively. World smelter production increased about 11,000 tons (7 percent), mostly owing to Malaya's output, which resumed its prewar rank as the world's leading producer in 1948. The Combined Tin Committee announced November 15 that the members had recommended to their countries discontinuance of international tin allocation. The International Tin Study Group met again during 1949, continuing its investigation of means for stabilization of the tin industry through international cooperation as prescribed under the Havana Charter.

Consumption of tin in 1949 in the United States decreased 20 percent from 1948; primary tin decreased 21 percent and secondary 18 percent. The Government retained control of distribution and use of the domestic supply for the eighth consecutive year and fixed the price. However, controls were successively relaxed until, effective December 1, only certain requirements for reporting and licensing requirements for exports remained. Domestic primary smelter output, nearly all from the Government-owned smelter of Texas City, remained virtually unchanged. Secondary production was 17 percent less than in 1948. On a tonnage basis, pig-tin imports held the dominant position in the foreign tin trade in the United States in 1949 for the second time since 1941. Metal imports increased 22 percent and exceeded the tin content of concentrates by 57 percent. Receipts of concentrates, in terms of metal, were, nevertheless, 2 percent greater than in 1948. The increase was chiefly from Indonesia. Imports from Bolivia and Thailand decreased. Domestic stocks of pig tin and tin ore and concentrates at the year's end were nearly 60 percent greater than on January 1.

The domestic price for grade A tin was $1.03 from June 1, 1948, until September 28, 1949, then dropped successively until it reached 77.50 cents December 29. The annual average for 1949 was almost unchanged from 1948. The domestic market was free upon relaxation of control August 26.

GOVERNMENT CONTROLS

When the year 1949 opened, announcement had been made that the tin-conservation program would continue essentially unchanged, with Orders M–43 and M–81 in effect through June 30, 1949. (Tin controls had been scheduled to expire June 30.) However, chiefly because of interruption of Bolivian tin production by labor disturbances in May and June which threatened the supply of tin and tin ores, continuance of the authority over tin and tin products was recommended and extended to June 30, 1950.[1] Controls were modified to permit greater flexibility in the use of tin. Without involving allocations of tin, numerous small changes were announced March 24 which were designed to alleviate minor hardships among some groups of users. Special quota limits on beer and animal-food cans were removed, and use of electrolytic tin plate was permitted in some important classifications previously restricted to black plate and bonderized. Disposal of mill accumulations was permitted, and uses of terneplate were liberalized to include repair and replacement of roofing, smoke pipe, and flue-jacket liners for hot-water heaters. Optional use of 0.50-pound and heavier electrolytic tin plate for hot-dipped tin plate was permitted. In June further relaxations were effected. Controls were lifted on cans from 0.25 electrolytic, and 1.30- and 4.0-pound terneplate and use of 0.50 electrolytic for hand-soldered cans. On August 25, announcement was made of the revocation of Order M–81 and specification restrictions on closures (Order M–43) effective December 1, 1949. End use restrictions were eliminated, but pig-tin allocations, controls over inventories and imports were retained until discontinued by announcement November 25 of an amendment to M–43, effective December 1, which reduced controls to a reporting basis. Briefly, submission of reports was required monthly from every producer, distributor, and importer of pig tin, and any person using 1,000 pounds or more of pig tin in a calendar month, and any person having 2,000 pounds or more of pig tin in his possession or under his control on the first day of a calendar month. Also reports on imports with each customs entry were required to be filed.

[1] Public Law 153, 81st Cong., 1st sess., approved June 30, 1949.

As of December 31, 1949, tin and manufactures, including tin plate, were on the positive list requiring export license for shipment to any destination abroad except Canada.

Purchase of tin metal, ore, and concentrates and pricing were for the most part again centered in the Reconstruction Finance Corporation.[2] RFC also has authority to improve, develop, maintain, and operate by lease or otherwise the Government-owned tin smelter (Longhorn smelter) at Texas City, Tex., and to finance research in tin smelting and processing. The law requires RFC to submit semiannual reports.

The Combined Tin Committee was dissolved on November 14. An advance statement released by the committee November 15 was as follows:

> The Combined Tin Committee met November 14, 1949 and reviewed the tin position. In view of the statistical position for tin metal and in view of the fact that the London Metal Exchange is reopening November 15, 1949, the members of the Combined Tin Committee considered that continuation of the system of international allocations no longer serves its original purpose. Consequently members are recommending to their governments that the Committee be dissolved.

DOMESTIC PRODUCTION

MINE OUTPUT

Domestic mine production of tin in concentrates was 68.4 long tons in 1949 compared with 4.7 tons (revised figure) in 1948. Most of the output was derived from placer deposits in Alaska. The largest producer was the Northern Tin Company, Inc., operating on Buck Creek, Port Clarence district, Seward Peninsula, Alaska. About 39,000 cubic yards of material were processed by the company, from which about 42 long tons of concentrates containing 29.3 tons of tin (69.79 percent) were recovered and shipped. The company also moved about 47,900 cubic yards of material in stripping operations. With an output of about 38 long tons of tin-tungsten concentrates containing about 20.7 tons of tin, the United States Tin Corp. was the second-largest producer of tin from domestic mines in 1949. This company operated its placer on Lost River, Port Clarence district, Seward Peninsula region, Alaska, treating about 15,000 cubic yards of material averaging approximately 4 pounds of cassiterite (SnO_2) per cubic yard. At Climax, Colo., the Climax Molybdenum Corp. recovered a very small tonnage of tin as a byproduct of mining for molybdenum. Assays show only a trace of tin in the crude ore mined by the company. Smaller outputs of 1 ton of tin concentrates or less were produced by the Coyle & Rasmussen Mining Co., the Cleary Hill Mines Co., and Tom Dean (produced before 1949 but not previously accounted for), all in the Hot Springs district, Yukon River Basin region. Virtually all of the tin concentrates shipped in 1949 were sold to the Office of Metals Reserve.

[2] Public Law 125, 80th Cong., 61 Stat. 190, approved June 28, 1947, extended by amendment by Public Law 824, 80th Cong. (approved June 29, 1948) to June 30, 1951.

Bureau of Mines reports of investigations made in previous years of the Majuba Hill copper-tin mine,[3] Pershing County, Nev., the Potato Mountain tin placer deposits,[4] Seward Peninsula, Alaska, and the tin-bearing pegmatites in the Tinton area,[5] Lawrence County, S. Dak., were published in 1949.

Mine production of tin (content) in the United States, 1940–44 (average) and 1945–49 by States, in long tons

Year	Alaska	South Dakota	Colorado	Other States	Total	
					Long tons	Value

1949	51.6		16.8		68.4	152,210

[1] Revised figure.
[2] A very small quantity from South Dakota is included with Alaska.

SMELTER OUTPUT

Smelters in the United States produced 35,834 long tons of tin in 1949 compared with 36,703 tons in 1948. Output was essentially that of the Government-owned smelter at Texas City. This smelter (Longhorn smelter) produced 36,053 tons (including 238 of secondary from drosses) in 1949 and 36,678 tons in 1948. The Vulcan Detinning Co. recovered a small tonnage of tin metal. This company began construction of a plant for the recovery of tin from low-grade tin concentrates in 1948 and was to have a minimum daily capacity of 25 to 50 tons of concentrates. The cost of the plant was estimated at $750,000. However, because of increased construction and other costs, this estimate was about $250,000 too low. The company annual report for 1949 contained the following statement:

> On November 30 the new plant for treating low grade tin concentrates was put into operation. Rate of production at the start was kept at a low level while the various pieces of equipment were tried out and adjusted. As is usual, various problems incident to any new development were encountered but no major difficulty developed. As we are stepping up our operations and approach the rate for which the plant was designed, we have met no insurmountable obstacle and our technical staff is confident of the practicability of the process. However, one uncertain element in the situation relates to our ability to obtain at economic prices supplies of tin concentrates, either directly from producers or from stocks purchased by the Reconstruction Finance Corporation for the government-owned smelter at Texas City.

In 1949 the Longhorn smelter treated concentrates, chiefly from Bolivia, Indonesia, Thailand, and the Belgian Congo. The smelter continued to treat low-grade middling rejects accumulated during

wartime operations; by the end of the fiscal year 1949, approximately 6,000 long dry tons of rejects containing about 1,200 tons of tin had been shipped to the Capper Pass smelter, Hull, England, with the return to this country of the tin content in the form of high-grade electrolytic tin. In April RFC arranged for the processing by Vulcan Detinning Co., Sewaren, N. J., of a 500-ton lot of poorly cast pig tin previously acquired in Thailand. A small-size reverberatory furnace was installed and placed in operation at the Longhorn smelter to smelt directly all drosses and other plant byproducts carrying impurities instead of returning them to regular reverberatory furnaces for smelting. Use of this furnace will eliminate production of G-grade tin metal; instead, a small tonnage of alloy metal (Copan) will be produced. Analysis of Copan is as follows, in percent: Tin, 83.96; cadmium, trace; nickel-cobalt, 0.042; silver, 0.02; antimony, 13.05; copper, 2.635; arsenic, 0.10; lead, 0.156; bismuth, 0.017; iron, 0.015; sulfur, 0.003. Of the total tin produced at the Longhorn smelter in 1949, 64 percent was 3-Star grade; 27 percent 2-Star; 5 percent 1-Star; and 4 percent No-Star G. Most of grade G was resmelted, further refined, and converted into 2-Star and 1-Star. In December, 451 long tons of Chinese and Thai bullion were recast into 3-Star. Drosses acquired from domestic firms were also used, from which about 238 long tons of tin metal were recovered. In 1948 the percentages of the total production of the various grades were respectively 62, 31, No-1-Star, and 7. The Longhorn smelter continued to be operated on a cost-plus-fixed-fee arrangement by Tin Processing Corp., (a Delaware corporation) a subsidiary of N. V. Billiton Maatschappij. The contract with this firm has been extended to June 30, 1951. Beginning with the fiscal year ended June 1948, the fixed fee has been $200,000 per year. The RFC was authorized on June 30, 1949, by Public Law 148, Eighty-first Congress, first session, to sell tin concentrates containing not more than 25 percent tin to private interests for smelting in America into grade A tin. It provides that a minimum price at which any such concentrates of tin-bearing materials are so sold shall represent no less return to the Government, as determined or estimated by the RFC, than would result through the Government itself transporting and treating such concentrates or tin-bearing materials in any Government-owned or controlled facility and transporting and selling pig tin recovered there. Another provision is that the RFC shall contract to buy up to an equivalent amount of grade A pig tin for future delivery, not to exceed 4 months from date of delivery of such concentrates or tin-bearing material to the processor, at the RFC's selling price for such grade on the date of such contract.

The total cost of the tin-smelting program at Texas City from 1942 through June 30, 1949, was $433,613,225. This figure includes the cost of smelter facilities ($10,046,364) and the cost of concentrates, which amounted to $393,571,278, including ocean freight and delivery charges to the smelter in this country. Authorized sales from smelter production through June 30, 1949, totaled $295,800,003.

Longhorn tin-smelter production, by months, 1942–49, in long tons

[1] Includes 238 tons of secondary from drosses.

SECONDARY TIN

The total recovery of tin from secondary metal decreased 17 percent both in quantity and in value in 1949 compared with 1948. The quantity produced in 1949 was the lowest since 1939. However, due to the high prices that prevailed both in 1948 and 1949, the value of this tin, except for 1948, was the highest on record. Most of the tin from secondary sources is recovered from tin-base scrap, which is not refined to make pure elemental metals but is refined and reprocessed to obtain a salable product, chiefly as brass and bronze, lead-base alloys, tin babbitt, and chemical compounds. In 1949 tin recovered in these products totaled 19,060 long tons, and tin recovered as metal totaled 3,170 long tons. These data indicate a 20-percent decrease in tin recovered in tin-base alloys and as chemicals and a 2-percent increase in tin recovered as metal. Detinning plants accounted for most of the recovery of tin as metal. Detinning plants recovered 3,391 long tons of tin as metal and in chemicals in 1949; tin-plate clippings and old cans were the source of 3,262 tons and other tin-bearing materials of 129 tons. The industry reported treating 387,468 long tons of tin-plate clippings in 1949, the largest on record. The average quantity of tin recovered per long ton of clean tin-plate scrap in 1949 was 18.29 pounds. Before electrolytic tin plate was introduced, recoveries averaged about 37 pounds per ton of material detinned.

To maintain comparability the quantities shown in the columns entitled "Tin recovered at detinning plants," in the accompanying table, include that recovered from tin-plate clippings and old containers only. For additional data concerning the secondary tin industry see Secondary Metals—Nonferrous chapter of this volume.

Secondary tin recovered in the United States, 1940–44 (average) and 1945–49, in long tons

Year	Tin recovered at detinning plants			Tin recovered from all sources			
	As metal	In chemicals	Total	As metal	In alloys and chemicals	Total: Long tons	Total: Value
1940–44 (average)	4,030	450	4,480	4,700	28,100	32,800	$37,897,036

1948	2,930	340	3,270	3,100	23,800	26,900	59,796,140
1949	2,850	410	3,260	3,170	19,060	22,230	49,461,354

CONSUMPTION

APPARENT CONSUMPTION

Apparent consumption derived by adding net imports of pig tin to domestic smelter production increased 12 percent in 1949 over 1948. As changes in consumer, dealer, and Government stocks are not taken into account, apparent consumption may vary greatly from actual consumption as measured in finished products. In 1949 it was considerably in excess of actual consumption, chiefly as a result of stockpiling by the Government. The accompanying table gives the data for 1940–44 (annual average) and 1945–49. A comparable series annually for 1910–38 was published in Minerals Yearbook, 1939 (p. 680), and for 1939–48 in Minerals Yearbook, 1948 (p. 1212).

Apparent consumption of tin, 1940–44 (average) and 1945–49, in long tons

1940–44 (average)	76,537
1945	48,086
1946	58,144
1947	57,771
1948	85,808
1949	95,904

CONSUMPTION BY USES

Total domestic consumption of tin was 20 percent less in 1949 than in 1948. The use of primary tin decreased 21 percent and secondary 18 percent. Six items—tin plate and terneplate, solder, bronze, babbitt, tinning and type metal—accounted for 95 percent of the total consumed in 1948 and 1949. The use pattern was slightly different from 1948 as bronze gave place in rank to solder. In 1949, for the first time since 1941, solder resumed its prewar position in importance as the second largest user of tin. The use of significant tonnages of tin for chemicals and tin oxide were recorded.

Tin plate and terneplate used nearly two-thirds the total primary tin; but tin mills were operated at a lower rate, and 6 percent less tin was used for these products in 1949 than in 1948. Tin-plate production was 2 percent less than in 1948, chiefly because of decreases in exports and requirements for the food pack. Some production was lost as a result of cessation of operations at mills during the steel strike in the latter part of 1949. Hot-dipped tin plate production, accounting for only 45 percent of total tin plate, declined 11 percent in both production and tin consumption. Nevertheless nearly 70 percent of the total tin used to make tin plate was for hot-dipped in 1949. Electrolytic tin plate output requiring considerably less tin per unit of product than hot-dipped continued to expand and established an annual record output in 1949. By using only 3 percent more tin, electrolytic lines produced 6 percent more tin plate than in 1948. Electrolytic tin plate production alone in 1949 was virtually the same as the total domestic output of tin plate achieved 2 decades ago in 1929 (a record year, not exceeded until 1936). However, this electrolytic tin-plate production required less than a third the quantity of tin used in 1929. Hot-dipped tin plate has been used chiefly to make sanitary or packers' cans. Electrolytic tin plate, in increasing proportions, has been divided among general line cans, sanitary cans, and closures and crowns. Demand for cans of all kinds increased only 1 percent in 1949. Requirements for cans for the food pack (the chief user) decreased 2 percent, whereas that for nonfood products increased 10 percent. Greater use of beer cans accounted for most of this increase. Use of beer cans increased 28 percent and tonnagewise accounted for 11 percent of all products packed in 1949. Special quota restrictions on the amount of tin for beer cans (Order M-81—containers) were removed in March.

There were indications of the probable return to prewar practice of heavier-coated ternes, as the quantity of tin per unit specified for some of the tonnage was higher, and 60 percent more tin was required for long ternes in 1949 than in 1948, whereas tonnage output of long ternes increased only 10 percent. Total terneplate production decreased 26 percent in 1949; a drop of 55 percent in the output of short ternes offset an increase of 10 percent in the production of long ternes. Total tin used in the manufacture of terneplate decreased 7 percent.

The use of secondary tin for solder increased for the fourth consecutive year and was 18 percent more than in 1948; however, among primary items solder accounted for the largest decrease (6,888 tons). Consumption in bronze decreased the most (5,636 tons) among items in the secondary tin category. The total of primary and secondary tin used for bronze and brass decreased 33 percent, as shipments of ingot declined 37 percent in 1949. Consumption of primary tin in babbitt decreased for the fifth consecutive year and was 42 percent less in 1949 than in 1948.

Consumption of primary and secondary tin in the United States, 1940–44 (average) and 1945–49, in long tons

STOCKS

Stocks of pig tin and tin in ore were nearly 60 percent more at the end of 1949 than at the beginning of the year. In addition, about 10,550 tons (12,400 at the beginning of year) were in process, in scrap and as secondary tin. Industry stocks of primary pig tin were off 4 percent in total; but tin platers increased their inventories 19 percent. Industry stocks increased nearly 3,000 tons in December. RFC stocks of tin metal were 24,322 tons at the beginning of the year compared with 22,452 at the year's close; stocks of concentrates contained 19,029 tons of tin at the beginning of the year and 21,117 at the close.

Stocks of virgin pig tin in the United States, Dec. 31, 1944–49, in long tons [1]

[1] Excludes Government purchases delivered for stockpiling or at Texas City smelter. Also excludes tin in process and secondary pig tin.

PRICES

Tin prices continued nominally subject to Government control and action during 1949. The market was substantially sustained by tin procurement for national stockpiling, as supply greatly exceeded industrial demand. The domestic market was free upon relaxation of controls August 26, 1949. From June 1, 1948, until September 28, 1949, the RFC New York selling price of grade A was $1.03 a pound. The price was lowered to 96 cents on September 28 and to 95 cents on October 24, at which it was maintained until reduced to 85 cents on November 21. Between then and the end of the year the price was changed downward by RFC eight times until December 29, when the price was 77.50 cents. For the most part the open market price did not conform with RFC's price, which was brought in line with other offerings for grade A. RFC's prices of lower grade also did not always conform with outside market quotations. In December, grade B was

quoted by RFC at 82.8 cents, while English refined was being sold at about 79 cents; with RFC 99 percent at about 81⅛ cents, Chinese 99 percent was available at 76.5 cents. However, RFC began offering grade A at or below outside market prices on December 2 when it reduced its price to 81 cents. Other changes were effected to correspond somewhat with offerings by the British Ministry of Supply.

In the United Kingdom there was an artificial price of £569 a ton until sterling devaluation September 18 when partial readjustment began. Readjustment was accelerated when the London Metal Exchange reopened November 15. The British Ministry of Supply withdrew Straits tin from the American market on August 30 to prevent dollar losses. This action was reversed September 9, and American sales for future shipments from Malaya were permitted. However, the British Ministry of Supply suspended sales from midnight September 17. Following devaluation of sterling on September 18, the British Ministry of Supply raised its selling price to £750 per ton September 26 and reduced the selling price in New York from $1.03 to 95 cents a pound. British Ministry of Supply Control of Tin order 6 (revocation), 1949, freed tin from control November 15, 1949, and the London Metal Exchange reopened for dealings in tin. At the same time the Singapore market was allowed to resume operations. Resumption of trading on the London Metal Exchange after almost 9 years produced the greatest premium for prompt Standard tin ever recorded. Prompt metal was sparsely offered, resulting in a big backwardation. There was a spread of as much as £91 in the afternoon session November 18. Three months futures went down to £565 before improvement set in, but on December 23 it stood at £582 10s. while the spot quotation was £606. On the last day of the London metal market, at the year's close, cash tin was recorded changing hands at £600 to £601 10s. Unavailability of free tin made market conditions artificial as the year closed. The chairman of the exchange was appointed Government broker, with all British Ministry of Supply commissions pooled and after deduction of expenses, divided among certain members. The freedom of the market was complete but was reserved for authorized firms whose operations were subject to post facto control.

Although the Singapore market opened November 16, it was unable to function because, probably, for the first time on record, there were no outright buyers and no price could be established without their bids. On November 18, Straits on the Singapore market underwent a very large decline of £60 per ton to £578 4s. 5d. The market opened at the equivalent of £638 4s. 10d. on November 17 (a drop of about £100 from the British asking price of Straits f. o. b. Singapore before November 15). At the year's close the price of tin at Singapore ex smelter was quoted at £562⅝. From November 1946 to November 14, 1949, the British Ministry of Supply was the sole purchaser of exported metallic tin ex Penang and Singapore. Tin prices, ex works, averaged the equivalent of 94.78 cents per pound in 1949 against 95.73 cents in 1948.

From September 19 to November 15 as far as sales of Malayan tin matched intake, Malayan smelters and producers got the benefit of active selling price or current selling price of £739 per ton, ex

smelter Penang and Singapore, smelters were to get £728, the difference representing warehousing, interest charges, etc. To the extent, if any, that intake exceeded sales so that the Ministry had to increase its stocks of Malayan tin, smelters were to be paid at the price ruling before September 19—£553½. It was the intention of the Ministry to see that any release in its stocks would be orderly with due regard to need for reasonable price stability for tin pending termination of final price to smelters in above manner. An interim payment of 80 percent of the smelters' share of the current selling price at the time—£582½ (72.81 cents per pound) was to be made. The balance was payable to the Government of the Federation of Malaya for distribution to the industry after deduction of taxation. A similar arrangement was in effect with Nigeria during the period, with 80 percent interim payment based on current United Kingdom selling price of £750 sterling or £567 per ton of tin and ore f.a.s. Nigerian port.

FOREIGN TRADE [6]

Tin, one of the principal imports of the United States, ranked eighth in value among all the commodities in 1949. Before the war (1935–39 average) it was in sixth place. Imports of pig tin and ore and exports of tin plate are the principal tin items in foreign trade of the United States. Of less importance has been foreign trade in imports of tin plate and terneplate and exports and imports of scrap, circles, strips, waste-waste, miscellaneous tin and manufactures and compounds. In 1949 imports of pig tin for consumption totaled 60,224 long tons, the highest since 1941, and imports of tin in concentrates were 38,311 tons, the highest in history. Total exports of tin plate, taggers tin, and terneplate (including long ternes) were 498,371 tons, a 9-percent decrease from 1948. Further data on imports and exports are shown in the accompanying tables. Tin contained in babbitt, solder, type metal, and bronze imported and exported is accounted for in the Lead and Copper chapters of this volume. In 1948, on a tonnage basis, pig-tin imports resumed (for the first time since 1941) the dominant position in the foreign trade of the United States. This position was retained and strengthened in 1949, with a 22-percent increase in imports of metal over those of 1948.

Malaya was the principal source of metal in 1949, furnishing 57 percent of the total. Other important sources of metal imported in 1949 include Belgium, the Netherlands, Belgian Congo, China, and the United Kingdom. Imports from the Netherlands and the United Kingdom increased substantially over 1948.

Imports of tin and concentrates in the United States increased 2 percent in 1949, as compared with 1948. Bolivia, the chief source, supplied concentrates containing 19,265 long tons of tin and accounted for 50 percent of the total. The second-largest source of tin imported as concentrates was Indonesia, supplying 15,223 tons. Other smaller sources included Thailand, Belgian Congo, China, Mexico, Portugal, Malaya, and Burma. Bolivia has been the source of 70 percent of the tin in concentrates imported from 1941 through 1949, inclusive.

[6] Figures on imports and exports compiled by M. B. Price and E. D. Page, of the Bureau of Mines, from records of the U. S. Department of Commerce.

Since 1941 the United States has been the world's principal source of tin plate. In 1949 exports of tin plate, taggers tin, and terneplate, including long ternes, decreased 9 percent from 1948 and 10 percent from the high level attained in 1947. In 1949 ground was lost in the export markets, chiefly, of Argentina, Belgium-Luxembourg, Brazil, Canada, Cuba, France, and Portugal. There were significant increases in exports to Denmark, Italy, and the Netherlands. Gains recorded in these and other European countries were mostly accountable to Economic Cooperation Administration (ECA).

Exports of hot-dipped tin plate totaled 384,022 long tons valued at $76,163,093 in 1949. Principal countries of destination were the Netherlands (46,907 tons), Australia (37,461 tons), Brazil (30,948 tons), and Italy (25,347 tons). Exports of electrolytic tin plate totaled 98,015 tons valued at $17,299,264. This material was shipped to 20 countries, the leading ones being the Union of South Africa, Canada, the Netherlands, Brazil, Turkey, the Philippines, and Australia. Late in 1949 a comparatively large tonnage of tin plate was imported into the United States from Canada, presumably to supplement a shortage caused by the steel strike (October–November).

According to the American Iron and Steel Institute, producers in 1949 shipped for export 519,618 short tons (601,697 in 1948) of tin plate, of which 402,821 tons (508,474 in 1948) were hot-dipped and 116,797 (93,223 in 1948) electrolytic.

Tin ore, concentrates, metal, alloys, scrap, and tin-plate scrap are duty-free. However, the duty-free status of the above articles was made subject to the provision in paragraph 1785 of the Tariff Act of 1930 (and the corresponding provision of the Tariff Act of 1922) that there shall be imposed and paid upon cassiterite, or black oxide tin, a duty of 4 cents per pound, and upon bar, block, pig tin, and grain or granulated a duty of 6 cents per pound when the mines of the United States are producing 1,500 tons of cassiterite and bar, block, and pig tin per year. Subject to this condition, the duty-free status of the articles specified in paragraphs 1785 and 1786 was bound in the Geneva agreement; the duty-free status of the articles in paragraph 1786 was previously bound in the trade agreement with the United Kingdom, effective January 1939.

TECHNOLOGY

The Bureau of Mines, in cooperation with the United States Department of State and the Bolivian Government, continued research on recovery of tin from low-grade ores by sulfide volatilization. A description of a sulfide volatilization process for the recovery of tin from ores and used in Germany was published.[7]

A brief résumé of the tin-smelting process at the Government's Texas City plant and at the Vulcan Detinning Co. plant at Sewaren, N. J., follows:

At the Texas City plant ores are mixed with salt and ground coke and roasted in a rotary kiln to reduce the iron to the ferrous state and chloridize the lead and silver. The roasted ore is leached in spherical tanks with acidproof lining in a solution of hydrochloric acid at 100° F. to remove iron and other undesirable impurities before smelting. When leaching is complete, a filter screen is placed over the manhole, the tank is inverted, and air pressure is applied until the filter cake is blown fairly dry. The leached residue is smelted in separate lots in eight reverberatory furnaces. About 85 percent of the tin is recovered as crude bullion, and the remainder is retained in a low-silica slag. The slag from the primary smelting furnaces is resmelted in a larger furnace to recover the tin as an iron-tin alloy known as hard-head. The hard-head is granulated and returned to the primary furnaces for resmelting.

The crude bullion is dressed and then held at a temperature slightly above the melting point to permit formation of crystals of the metallic compound $FeSn_2$. These crystals are removed by filtering the hot metal through a porous tile metal filter, giving a bullion containing only about 0.006 percent impurities. Arsenic, antimony, and bismuth are removed as a dross by successive additions of metallic aluminum, molten sulfur, and sodium hydroxide. The refined bullion is stored in a reverberatory furnace, from which it is removed and cast into pigs.

In the original plant, as it was operated during the war, the leach liquors were drained into a storage pond. Since then an acid recovery plant has been constructed for draining these waste liquors to recover hydrochloric acid and small quantities of lead, silver, copper, and tin that are dissolved during the acid leach.

At the Vulcan Detinning Co. plant a process developed by the company for recovering tin from low-grade Bolivian ore is used. The process is described in United States Patent 2,416,709, issued March 4, 1947, and consists of the following steps:

1. Reduction of finely ground tin ore to the metallic state in a rotary kiln.
2. Leaching of the roasted ore in a hot solution of sodium hydroxide ($NaOH$) and sodium nitrate ($NaNO_3$) to extract the tin as sodium stannate.
3. Precipitation of tin oxide by carbonation of the sodium stannate solution to produce pure tin oxide which may be reduced to give pure metallic tin.

An alternate procedure to step 3 is to evaporate and crystallize sodium stannate, which may then be used to make up electrolyte for producing electrolytic refined tin such as is produced by Vulcan in its detinning plant at Neville Island near Pittsburgh.

A process for the recovery of tin from tin slags was described.[8] The Ashcroft-Elmore tin process, which consists essentially in distilling a mixture of finely ground tin concentrate with a reducing agent (charcoal, low-temperature coke) and ferrous chloride, was described.[9]

[9] Malan, H. L., the Ashcroft-Elmore Tin Process: Mining Mag., London, vol. 81, No. 3, September 1949, p. 137.

United States patents issued during 1949 relative to tin include the following:

Jordan, J. F., Process for the Extraction of Tin from Iron Alloys: U. S. Patent 2,474,979, July 5, 1949.
Chace, P. G., Corrosion-resisting Composite Metal: U. S. Patent 2,482,897, Sept. 27, 1949.
Waterfall, F. D., Selective Carburization of Metals: U. S. Patent 2,485,176, Oct. 18, 1949.
Stumbock, M. J., Electrical Contact Element Containing Tin Oxide: U. S. Patent 2,486,341, Oct. 25, 1949.
Rudolph, G. A., Process of Making Stannic Acid From Tin Bearing Material: U. S. Patent 2,486,800, Nov. 1, 1949.
Clifton, F. L., Electrodeposition of Tin or Lead-Tin Alloys: U. S. Patent 2,489,523, Nov. 29, 1949.

A meter, developed at the research laboratory of the Carnegie-Illinois Steel Corp., which continuously indicates and records the tin-coating thickness on steel strip during the plating operation, is now in use on the Ferrostan electrolytic tinning lines of the United States Steel Co. and subsidiaries. The meter is reported to indicate tin-coating weights as accurately as chemical methods.

Tin Research Institute, Inc., 492 West Sixth Avenue, Columbus, Ohio, offers free service for technical inquiries and general information on tin. A sponsorship with Battelle Memorial Institute provides facilities for technical investigations. The Tin Research Institute, Inc., maintains a technical library on tin and has a number of publications available for free distribution. Among those made available in 1949 were: Tin and Its Uses, March 1949, No. 20; Tin and Its Uses, October 1949, No. 21; Fusible Alloys Containing Tin; Equilibrium Data for Tin Alloys; and Report on the Work of the Tin Research Institute, 1947–48.

WORLD REVIEW

INTERNATIONAL TIN STUDY GROUP

Representatives of eight major tin producing and consuming countries met in London in October 1946 and agreed that a study group should be established. The International Tin Study Group was organized at a meeting in Brussels in April 1947. A brief report on the meetings held by the study group through 1949 has been published as follows: [10]

At the first meeting of the International Tin Study Group held in Brussels in April 1947, terms of reference for the Group were agreed. The principal features of these terms of reference are (1) that membership shall be open to all countries principally interested in the production, consumption or trade in tin; (2) that the Group shall have the functions of considering possible solutions to any problems or difficulties which are unlikely to be resolved by the ordinary development or world trade in tin; and (3) that the Group should establish a permanent secretariat.

The second Group Meeting was held in Washington in April 1948. The Group reviewed the world tin position and agreed to recommend to member-governments the setting up of a Working Party to examine the appropriateness

[10] International Tin Study Group, Statistical Bulletin: Vol. 2, No. 6, June 1949, and vol. 3, No. 1, January 1950, inside cover page.

and practicability of framing an intergovernmental agreement on tin conforming to the general spirit and principles of the Charter of the International Trade Organization. The meeting of this Working Party was held in The Hague in June 1948.

The Group held its third meeting in The Hague on October 25th/29th, 1948. The Group had before it the report of the Working Party. The purport of this report was that it would be appropriate and practicable to conclude an international tin agreement on the lines set out in the report. The Group modified these proposals in certain respects and forwarded to the member-governments a recommendation that, after certain preparatory steps, the member-governments should be asked to inform the Secretary whether they would be disposed to enter into an agreement on the broad lines proposed, and were willing to attend a conference to put the agreement into final form and to conclude it.

The Fourth Group Meeting was held in London on June 14th–22nd, 1949. The Group received the Report of the Drafting Committee set up at their last meeting and noted that the summoning of an International Commodity Conference on tin in the spring of 1949 had not been considered timely by all member governments. The Group set up a Working Party to prepare a statement on the position and prospects of the tin industry and also to prepare the draft on an Intergovernmental Commodity Control Agreement.

The Working Party met in The Hague from October 26th to November 2nd, 1949. It prepared the statement and the draft tin control agreement for the consideration of the member-governments. The draft agreement is designed, in the spirit of the Havana Charter, to establish equilibrium between supply and demand on conditions equally satisfactory to producers and consumers. It will be considered at the Fifth Group Meeting in the spring of 1950.

A Management Committee supervises the work of the Secretariat. The following are represented on that Committee: Belgium, Bolivia, British Colonies. France, Netherlands, United Kingdom and United States of America.

The Secretariat has been established at 7, Carel van Bylandtlaan, The Hague, Holland, to which all communications should be addressed.

The present membership of the Group is:

Australia	France
Belgium	India
Bolivia	Italy
British Colonies and Dependent Territories	Netherlands
Canada	Thailand
China	United Kingdom
Czechoslovakia	United States of America

WORLD MINE PRODUCTION

World mine production of tin, exclusive of U. S. S. R., increased 6 percent in 1949. Of the total output, Asia supplied 60 percent, South America 22 percent, Africa 15 percent, and other sources 3 percent. Most of the increase was provided by Malaya. Output in 1949 was 8,900 long tons greater than in 1948. Production in 1949 was 99 percent of the 1925-29 average, 94 percent of the 1935–39 average, and about two-thirds of the 1941 peak. U. S. S. R. mine production has been estimated [11] as follows: 1939–43 average, 2,500 to 3,000 long tons; 1944, 4,000 tons; 1945, 4,500 tons; 1946, 5,000 tons; 1947, 6,500 to 7,500 tons; 1948, 7,500 to 9,000 tons; 1949, 9,000 to 10,000 tons. The target for 1950 was reported to be 12,000 tons.

WORLD SMELTER PRODUCTION

Smelter production of tin in the world, exclusive of U. S. S. R., increased only 7 percent in 1949 over 1948. The Malayan tin-smelting plants at Penang and Singapore recorded a 26-percent increase in output, supplied 37 percent of the total, and were (as in 1948) the world's most important sources of pig tin. Next in rank as important tin-smelting sources are the United States, United Kingdom, Nether-

lands, and Belgium. Smelters in these countries supplied 92 percent of the world's tin in 1949.

About 60 percent of the world smelter output in 1949 was for the United States (in 1948, 55 percent). International allocations of tin metal by the Combined Tin Committee were continued through November 15, after which time the allocations were discontinued and tin purchases on the open market resumed.

World smelter production of tin, by countries, 1939–43 (average) and 1944–49, in long tons

[Compiled by Berenice B. Mitchell]

[1] Estimated by authors of the chapter and in a few instances from Statistical Bulletin of the International Tin Study Group.
[2] No production 1939–42; average based on 1943 data.
[3] American and British zones only.
[4] Data not available; estimate by authors of chapter included in total.
[5] Beginning January 1948, includes production from imported scrap and residues refined on toll.
[6] Including tin content of ores used direct to make alloys.

REVIEW BY COUNTRIES

Australia.—Production of tin in ores and concentrates was chiefly from Queensland, Tasmania, and New South Wales. Victoria, Western Australia, and the Northern Territory produced small quantities. Output in 1949 in Queensland increased 258 tons over 1948, offsetting a decrease in production from Tasmania of 146 tons. The largest individual producer was Tableland Tin Dredging, N. L., of Mount Garnet, Queensland, with a reported output of 689 tons of concentrates. (The average content of concentrates produced in Queensland in 1949 was 70 percent.) Prospecting and development were continued in the Mount Garnet district during the year. Plans for constructing a tin-plate mill at Port Kembla, New South Wales, were completed. Both electrolytic and hot-dipped tin plate are to be made. Estimated capacity will be about 120,000 tons of tin plate annually, requiring about 2,000 tons of tin.

Belgian Congo.—The closing of tin-smelting operations at Lubudi by Sermikat (Societe d'Exploitation et de Recherches Miniéres au Katanga) as a result of power shortage caused by decreased rainfall resulted in a 16-percent decrease in tin-ingot output in 1949. Therefore, the entire output was by the Geomines (Compagnie Geologique et Miniére des Ingenieurs et Industriels Belges S. A.) smelter at Manono, where output was 3,247 long tons, a slight decrease from the 3,268 tons produced in 1948. Total output of ore and concentrates in the Congo and Ruanda-Urundi was 18,061 long tons containing 13,184 tons of tin in 1949, a slight increase over that of 1948. Of the 1949 output, Ruanda-Urundi supplied 12.5 percent compared with 10.5 percent in 1948. In addition, tin is recovered from tin-tungsten and tantalum-columbium-tin concentrates and is included in the production shown for the Belgian Congo in the world table in this chapter.

Symetain's (Syndicat Miniére d'Etain) output of 4,671 metric tons of cassiterite containing 3,516 tons of tin brought total production (metal basis) from the beginning of operations in 1932 to over the 50,000-metric-ton mark. Work on the hydroelectric installations on the Lutshurukuru River to increase available power and permit greater mechanization, continued throughout the year and is expected to be finished by the end of 1951.

Geomines continued construction of a new plant for processing unweathered tin-bearing pegmatites, and the first unit with a capacity of 2,250 metric tons annually is scheduled for completion in early 1950. A second unit is expected to be in operation a year later, with others to follow until a total capacity of 10,000 metric tons is obtained. Drilling has indicated a reserve sufficient for 50 years' operation at the increased rate.

A low-pressure steam turbine has been ordered by Sermikat for an installation utilizing the water of a hot spring, furnishing 40 liters per second at 93° temperature. This installation will supply 250 kw.-hr. and is scheduled for operation in the first quarter of 1952.

Exports of tin metal were 4,588 metric tons and of tin concentrates 13,282 metric tons. Of the metal exports, the United States was shipped 3,833 metric tons, an increase of 64 percent over those of 1948. Tin concentrates shipped to the United States—the first since June 1947—totaled 1,033 metric tons.

According to regulations of July 1948, taxation on tin includes the following: (1) An 11-percent ad valorem tax based on a value fixed by the Governor General on tin metal and tin concentrates; (2) direct taxes on buildings, employees, and each mining concession and exclusive prospecting right; (3) income tax and a supplementary tax which replaces the additional export duty.

Bolivia.—Bolivia exported 9 percent less tin in concentrates in 1949 than in 1948. Tin contained in exports of concentrates in 1949 totaled 34,115 long tons. Exports of metal from the Oruro smelter were 402 tons in 1949, chiefly to the United States. Serious riots, resulting in the death of several Americans and Bolivians, began on May 29 at the Catavi mines of Patiño Mines & Enterprises Consolidated, Inc., which stopped operations at this mine and affected production at others. Order was virtually restored and production resumed at a curtailed rate July 15. A revolution began in August

and was quelled by early September. Fighting was reported in Cochabamba, Santa Cruz, Catavi, Potosi, and Oruro Departments. Tin mines continued operations, except for a few days. Some loss of exports of tin concentrates may have resulted from the temporary suspension of transportation facilities during the revolt.

No duties or taxes are applicable in direct form to the production of minerals in Bolivia, although mining companies must pay to the Bolivian Government specific taxes and duties on exports and annual profits. Taxes applicable to tin mined in the Department of Potosi, which are similar to those in other Departments, were published.[12]

A decree of January 6, 1949, provided for a tax of 1 cent per pound of fine tin exported, the proceeds to go for the expenses of constructing the Cochabamba-Santa Cruz highway. Following the protest made by the mining companies that taxes could not be imposed legally by decree, a modification acceptable to the miners was issued early in March, allowing payment of the new tax in bolivianos at the official rate of 42 bolivianos per dollar. Another export tax of 1 cent per pound of tin for the benefit of the Social Security Institute and a January decree providing that large and medium miners should pay in dollars for all purchases made on the local market were not enforced because of miners' protests. The cost of mineral production and exportation was increased considerably, however, by a freight raise granted the railroad companies by the Government in February in order that the railroads might meet new wage demands. Although the mining companies protested against the freight raise, all were paying it by the end of June, except the Patiño company which offered payment in bolivianos but still refused to pay the rate increase in foreign exchange.

Brazil.—The very small production of tin in Brazil recorded since 1943 has been mostly derived from placers. In the São João del Rei district of Minas Gerais numerous pegmatite dikes occur that contain tin. Through oxidation, decomposition, and erosion of these dikes, cassiterite has accumulated in the beds of a number of streams and rivers. The dikes dip at a rather steep angle and are seldom more than 1 meter wide. Other deposits of tin are found in the States of Paraiba, Rio Grande do Sul, Amapa, and São Paulo.

Output of tin plate at the Volta Redonda steel plant was reported at 6,319 tons in 1948 and estimated at 30,000 tons for 1949.

Burma.—Tin mining in Burma continued on a reduced scale in 1949, with production at about one-third the prewar rate. Mine output in 1949 was 1,781 long tons compared with 1,147 in 1948. Output decreased progressively throughout 1949 as internal disorders continued, with armed conflict in some parts of the country. Mining operations on an important scale were increasingly handicapped by dacoity.

Operations at the Mawchi Mines were suspended in June 1949 because of the political situation. From January to May the mine operated on a 30-ton-per-month basis, and by the middle of 1949, 200 long tons of tin and tungsten concentrates were mined. When operations ceased in June, more than 340 tons of concentrates were stored at Mawchi and 60 tons at Toungoo. Inability to dispose of

[12] Bureau of Mines, Mineral Trade Notes: Vol. 28, No. 1, January 1949, pp. 18-22.

the ore on hand created a serious financial crisis, which was relieved only by raising £150,000 in new capital in London to resume operations when the political situation permits.

All Anglo-Oriental-Malaya, Ltd., tin dredges in the Tavoy area have been closed by guerillas. The company said that its three dredges were not inoperative and that no one knew whether or not they had been damaged.

France.—Very little tin has been mined in France; the highest annual output until 1947 was 26 long tons of concentrates in 1917. However, in 1947 the tin content of ore mined was 43 long tons, 84 tons in 1948, and 73 tons in 1949. Occurrences are known in the Departments of Morbihan and Loire-Inferieure in Brittany and at Montebras, Vaulry, Cieux, Chanteloube, Meymac, Puy-les-Vignes, and Charrier on the Central Plateau.

The old mines at Nosay, Abbaretz, and surrounding villages in the Department of Loire-Inferieure (about 25 miles north of Nantes) are being reopened and worked by open-cast methods. Purchases of equipment are being financed with Marshall Plan credits. It has been reported that a workers' city will be built in the vicinity of the mines at Bois-Ver d'Abbarets. The mines are being operated by the Ste. Nantaize des Mineralis de l'Ouest, with American and foreign equipment, etc., estimated to cost between $325,000 and $350,000, plus £75,000 and 40 million Belgian francs. Under the long-term Organization for European Economic Cooperation (OEEC) plan, ending in 1952–53, production is expected to increase from 80 tons a year to 600 tons by 1952.

Indonesia.—Production of tin in concentrates in Indonesia totaled 28,965 long tons in 1949, a decrease of 5 percent from 1948. Failure to attain an original goal of 41,000 tons was attributed to a number of separate strikes, thefts of tin ore (which were estimated at 400 tons during the last half of 1949), and shortages of essential spare parts and other materials. Tin is produced on the islands Banka, Billiton, and Singkep, which in 1949 accounted for 57, 34, and 9 percent, respectively, of the total output. The basic labor force was 17,400 at Banka, 8,100 at Billiton, and 2,000 at Singkep. From 40 to 50 percent of these workers are Chinese.

Exports of tin in concentrates were about 30,459 long tons, of which 18,099 tons were shipped to the Netherlands, 12,352 tons to the United States, and 8 tons to Malaya.

The Indonesian Government controls all the production from Banka and five-eighths of the shares of the other producing company (N. V. Gemeenschappelijke Mijnbouwmaatschappij Billiton).

Malaya Federation.—The tin-mining industry in Malaya continued to record a progressive increase during 1949, despite the prevalence of terrorism. Mine production of tin in ore was 54,910 long tons in 1949, compared with 44,815 in 1948; 84,082 in the peak year of 1940; an annual average of 55,309 per year during the prewar period 1935–39. An output of 5,006 tons was made in March, the highest postwar rate, owing mainly to increased output from dredges.

The state of emergency declared in July 1948 continued. There have been fewer labor troubles since then, as most of the mines have been defended against terrorism by special police constables. Communist bandit attacks on properties decreased toward the end of the

year. These attacks, while contributing to supervision difficulties, caused little material damage. Unfortunately, there was some loss of life among tin miners. Delivery of plant and mining equipment from overseas improved; but there were long delays, especially as regards electrical equipment. Delivery dates from the United States were generally better than from the United Kingdom, but industrial disputes caused further delays from Australia. Wherever possible, efforts were made to encourage supplies from sterling areas. During the year 53 mining properties resumed operation, bringing the total worked to 686 when the year closed (there were more than 1,000 before the war). The labor force employed in tin mining had been increased from 46,858 at the beginning of 1949 to 47,107 at the year's end (not including 19,306 dulang washers in 1949).

Prewar rehabilitation plans progressed toward the goal of 80 dredges and 550 gravel-pumping mines to be in operation by 1950. There were no indications of any plans for expanding plant beyond prewar capacity. During 1949 the number of dredges increased from 67 in January to 76 in December. This means accounted for 27,673 long tons, or half the 1949 production. (The Storke report estimated that 40,500 tons or 55 percent of the 73,500-ton total set for 1949 would come from dredges.) Before World War II, dredging averaged 47 percent of annual production and was 52 percent in 1940, the peak year. Gravel-pumping mines increased from 464 at the beginning to 518 at the end of 1949, with production of 19,242 tons of tin—13 percent more than the Storke report estimate. Financial aid for the industry continued during 1949, but on a smaller scale. Rehabilitation loans through the Colonial Office—Ministry of Supply, London, to European-owned mines have amounted to S$49,609,525. Loans during 1949 totaled S$152,788. In addition, Chinese Tin Mines Rehabilitation Loans Board advances have been made to 363 mines, of which 286 were producing at the end of 1949. Up to the end of 1949, loans totaling S$78,514,661 had been advanced by the Government.

The principal source of pig tin in the world in 1949 was Malaya—from the large smelting plants of the Eastern Smelting Co., Ltd., Penang, and Straits Trading Co., Singapore. These plants increased their output 26 percent and supplied 37 percent of the world smelter production in 1949. Concentrates treated were derived mostly from Malaya, with smaller tonnages from Thailand, Burma, Indonesia, and French Indochina. The tin content of concentrates available from Malaya was 55,448 long tons compared with 44,792 in 1948. Imports originating elsewhere contained 6,560 tons of tin against 3,517 in 1948. The plants shipped 54,783 tons of metal (about 56 percent from Penang and 44 percent from Singapore). Nearly 80 percent went to the United States in 1949. Stocks of tin metal increased from 7,148 tons at the beginning of 1949 to 15,103 at the end, while stocks of tin in concentrates increased from 5,045 tons at the beginning to 5,222 at the end. The smelter of Tan Ban Joo, Ltd., Puda, Kuala Lumpur, which resumed operation in January 1948, smelted 515 piculs of tin ore during 1949, mostly for local consumption.

During 1949 the Ministry of Supply, London, continued to be the sole purchaser of exported tin metal until November 15, when the free market was reintroduced. From the latter part of September until November 15, the price depended upon sales by the Ministry of Supply

on tin delivered during that period. The Singapore market reopened to deal in tin on November 16, after being closed for nearly 8 years.

Nigeria.—The Colony and Protectorate of Nigeria, including the Cameroons under British trusteeship, is the largest of the British possessions in West Africa. In area, including the trust territory of the Cameroons, it is about equal to the combined area of Texas, Oklahoma, and Arkansas (about 372,674 square miles). The tin deposits are situated chiefly in the northern Provinces—Plateau, Kabba, Niger, and Benue. Deposits currently worked are alluvial or eluvial and are mined by placer methods. Lode-tin deposits are known to occur. Production has trended downward since 1944. Output of tin in concentrates in 1949 was 4 percent less than in 1948. The larger producing companies include: Jantar Nigeria Co., Ltd.; Minerals Research Syndicate; Bisichi Tin Co., Ltd.; Amalgamated Tin Mines of Nigeria, Ltd.; Gold & Base Metals Mines of Nigeria, Ltd.; United Tin Areas of Nigeria, Ltd.; African Prospectors, Ltd.; and Naraguta Tin Mines, Ltd. Most of the world supply of columbium is produced as a byproduct of tin mining in Nigeria. All the tin concentrates are sold to the United Kingdom, having been purchased by the British Ministry of Supply until the reopening of the London Metal Exchange November 15, 1949.

Thailand.—Rehabilitation of dredges continued in 1949. Production in 1949 increased 84 percent to 7,815 tons compared with 4,240 in 1948. The number of dredges operating increased from 19 in January to 30 in December.[13]

Production of tin increased steadily during 1949 as Thai Government rehabilitation loans made possible the purchase and importation of spare parts for dredge repairs. Devaluation of the pound sterling and subsequent adjustment of the bath/pound sterling rate at 35 : 1 affected tin royalties based on Singapore prices, and official revenue declined; at the same time, world market prices fell. Thai officials reviewed their plans to revise all Thai mining laws, including those pertaining to royalty levies, with a view to protecting State revenues and to encourage investment of foreign capital. At the end of the year, in order to stimulate sales of tin ore to dollar markets and to encourage increased production, the Cabinet considered revision of regulations requiring tin exporters to surrender half of their foreign exchange proceeds to the Bank of Thailand. On January 24, 1950, a notification was issued permitting exporters to retain 60 percent of their foreign exchange proceeds.

United Kingdom.—Geevor and South Crofty continued to be the only mines active. Some development work was being carried on at the Castle-an-Dinas and New Consols mines. In Cornwall the British Malayan Tin Syndicate operated its Basset property. Mine production totaled 1,217 long tons in 1949 compared with 1,281 in 1948. The United Kingdom smelter production of tin was the third largest in the world in 1949. Output declined 8 percent compared with 1948, mostly accountable to a large falling off in receipts of concentrates from Bolivia. Year-end stocks of tin in concentrates were 6,080 tons (6,386 at beginning of year) and as metal 14,682 tons (10,592 at beginning). Total stocks, including tin metal and concentrates

[13] Bureau of Mines, Mineral Trade Notes: Vol. 31, No. 3, September 1950, pp. 21-23.

afloat and visible consumers' stocks, were reported to be 23,138 tons at the end of 1949, an 11-percent increase compared with the 20,937 tons at the beginning.

The United Kingdom is the second-largest tin consumer in the world. British Ministry of Supply Control of Tin Order 6 (revocation), 1949, freed tin from its control November 15, and the Board of Trade announced (Export of Goods Control Amendment 7) that tin in certain forms (but not alloys, ores, or concentrates) was free from export licensing control. Total virgin tin consumed was 20,823 tons, 18 percent less than in 1948. The use of tin for making tin plate, the principal finished product, was virtually unchanged from 1948. Hot-dipped tin-plate production declined nearly 1 percent, but electrolytic tin plate, accounting for 10 percent of production, increased 60 percent in 1949. The consumption of tin for most of the other uses in 1949 was the lowest since the war.

On November 15, 1949, the London Metal Exchange reopened for dealings in tin. The situation prevailing at the time was one of extreme complexity. The British Ministry of Supply was the only holder of any stocks. In the first morning's trading, cash tin was at £725 per ton and forward at £660—a tremendous backwardation, which was more or less the state of affairs at the end of the year. Until the reopening of the exchange, the Ministry of Supply fixed the price of standard tin at £572½, and after devaluation of the pound the price was raised to £757.

Titanium

By Helena M. Meyer

GENERAL SUMMARY

THE YEAR 1949, like 1948, was characterized by widespread interest and research in connection with the production of titanium metal and alloys. The unprecedented amount of money and effort being expended by Government and industry in experimental work are largely responsible for the many predictions that titanium will find large-scale use much more rapidly than its predecessor metals. More than one authority predicted during the year that titanium and titanium alloys would become primary structural materials within 10 years. The problem of producing metal at a price low enough to attract production and consumption in large quantities remains to be solved. In 1949 titanium metal was produced commercially for the second successive year and on an increasing scale. One pilot plant operated continuously at approximately 100 pounds a day throughout the year, and a second pilot plant of somewhat larger capacity went into production near the close of the year. Other pilot plants were under construction at the year end, and the Bureau of Mines continued production of metal at Boulder City, Nev., throughout the year.

The titanium industry, in addition to the enthusiasm and energy expended in connection with the metal, was featured by new maximum production and shipments of ilmenite for the third successive year, by new peak imports, and by unprecedented output and shipments of rutile. However, 1949 was the first year in 7 that a new high ilmenite consumption record was not established. Rising inventories of crude materials were recorded also.

Present world sources of ilmenite and expected additions in the next year or two promise more than adequate supplies for present pigment needs, the only large tonnage use. Possibilities for expansion in requirements for the production of metal, however, as well as for potential growth in consumption in pigments, as a result of hoped-for improvement in world living standards particularly outside of the United States, are such that it is not safe to forecast that anticipated world supplies for the next several years will greatly exceed world requirements.

Production and shipments of ilmenite were 5 and 2 percent, respectively, greater than in 1948, following 14-percent gains for both in that year. Imports were 34 percent higher than in 1948 and 8 percent above the earlier peak in 1947. Domestic shipments and imports together were 40 percent above consumption, resulting in a 33-percent rise in industry stocks. Inventories at the end of 1949 were equivalent to 1.4 years' needs at the 1949 rate of use.

Titanium pigments, which take 99 percent of the ilmenite consumed in the United States, declined 6 percent in output and 9 percent in shipments in 1949. The drop in general industrial activity in midyear adversely affected use of titanium pigments; but this class of

pigments fared much better than other white pigments, namely white lead (dry and in oil), zinc oxide (lead-free and leaded), and lithopone, shipments of which declined 41, 33, and 44 percent, respectively, in 1949 as compared with 1948.

Production and shipments of rutile were 62 and 7 percent, respectively, larger than in 1948 and thus established new peaks. Some of the material covered, however, was not consumed for customary rutile purposes (see section on Domestic Production). Imports of rutile were little more than one-third of the reduced quantity entered in 1948. Supplies from domestic and foreign sources were more than adequate for the increased requirements in 1949, and inventories rose 18 percent. Stocks at the year end would fill United States needs at the 1949 rate of consumption for 11 months.

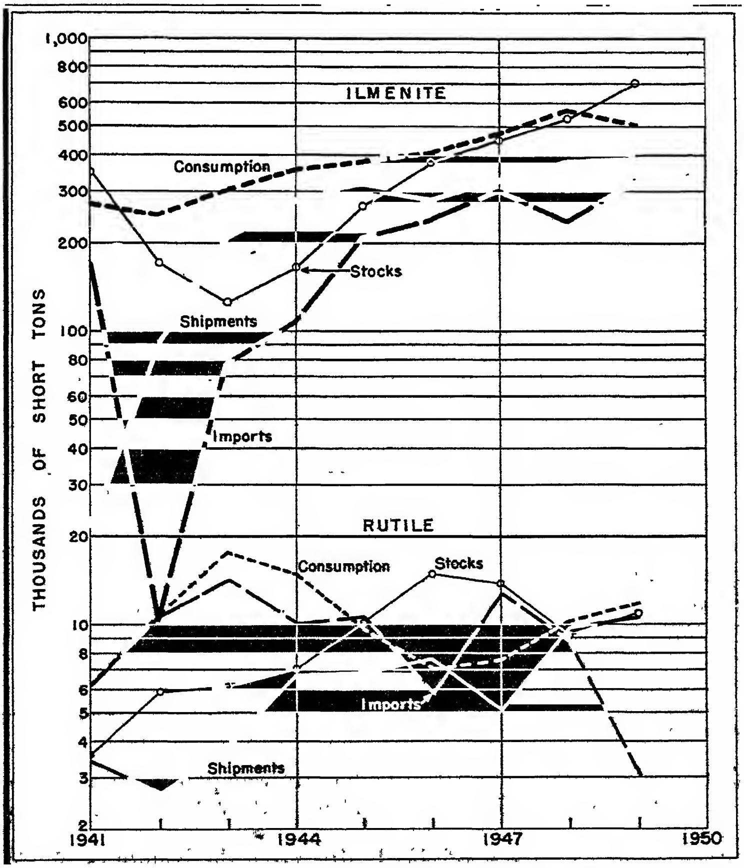

FIGURE 1.—Trends in ilmenite and rutile shipments, imports, consumption, and stocks, 1941–49.

Quotations for both ilmenite and rutile trended downward in 1949, a reflection of the ample supply of these concentrates in that year. The average quotation per gross ton for ilmenite containing 56-59

percent TiO_2, f. o. b. Atlantic seaboard, dropped from a range of \$18–\$20, according to grade and impurities, at the beginning of the year to \$14–\$16 in the first half of November and continued at this level beyond the year end. Quotations were nominal throughout the year. Nominal quotations for rutile, guaranteed minimum 94-percent concentrate, after continuing at 8–10 cents a pound for a number of years, fell to 6–8 cents in December 1948 and further to 4–5 cents by the end of 1949.

Progress toward bringing into production an ilmenite property that will rank with the world's largest producers and may exceed all others was reported in 1949. This is the property of the Quebec Iron & Titanium Corp. (owned by the Kennecott Copper Corp. and the New Jersey Zinc Co.) in the Allard Lake area of Quebec, Canada.

DOMESTIC PRODUCTION

Production and shipments of ilmenite rose 5 and 2 percent, respectively, in 1949, and both established new records for the third successive year. Rutile likewise reached new peaks in both classes, but rutile in 1949 includes a quantity of mixed product containing altered ilmenite, leucoxene, and rutile. The mixed product more nearly resembles rutile than ilmenite in TiO_2 content but was used in the manufacture of titanium pigments and metal. Total shipments of ilmenite ranged from 44 to 64 percent TiO_2 and of rutile from 84 to 96 percent TiO_2.

Arkansas.—Several recent reports [1] of the Bureau of Mines referred to titanium in Arkansas.

Production and mine shipments of titanium concentrates from domestic ores in the United States, 1940–44 (average) and 1945–49, in short tons

Year	Ilmenite				Rutile			
	Production	Shipments			Production	Shipments		
		Gross weight	TiO_2 content	Value		Gross weight	TiO_2 content	Value
1940–44 (average)	120,667	125,626	56,628	\$2,659,256	3,915	3,890	3,617	\$599,394
1945	308,516	308,518	141,852	7,359,170	7,179	6,837	6,414	869,920
1946	282,447	282,708	130,624	4,878,917	7,453	7,514	7,046	996,989
1947	336,533	336,061	157,328	5,029,490	8,562	5,157	4,813	533,548
1948	383,745	381,508	177,447	5,793,973	7,380	9,907	9,226	647,334
1949	402,334	389,234	186,535	6,212,348	[1] 11,988	[1] 10,559	[1] 9,414	489,798

[1] Includes a mixed product containing altered ilmenite, leucoxene, and rutile.

California.—A small quantity of ilmenite was produced at the property of the Ferro-Titan Minerals Co., Sun Valley, Los Angeles County, Calif.

Florida.—The property of E. I. du Pont de Nemours & Co. at Starke, Fla., began to produce ilmenite and a mixed product contain-

[1] Reed, Donald F., Investigation of Christy Titanium Deposit, Hot Spring County, Ark.: Bureau of Mines Rept. of Investigations 4592, 1949, 10 pp. Investigation of Magnet Cove Rutile Deposit, Hot Spring County, Ark.: Bureau of Mines Rept. of Investigations 4593, 1950, 9 pp.

Calhoun, W. A., Titanium and Iron Minerals from Black Sands in Bauxite: Bureau of Mines Rept. of Investigations 4621, 1950, 16 pp.

ing altered ilmenite, leucoxene, and rutile in March 1949. The mixed product is included in this report in the rutile tonnages because it more nearly resembles rutile in TiO_2 content, although it was used in 1949 to make pigments and metal. The addition of this product to rutile resulted in raising United States production and shipments to the highest annual quantities on record. A report [2] on titanium in Florida was recently released. According to this report, the du Pont property was expected to produce 100,000 tons of titanium products annually. As a result of the disclosure of a large concentration of heavy minerals in Trail Ridge, owing to drilling by the Bureau of Mines and extensive investigation by du Pont, as well as indication of the possibility of similar occurrences elsewhere, the drilling of other locations within the State was begun in August 1947. This exploration was completed in April 1948, and results were described in the aforementioned report.

Production of ilmenite and rutile came again from the Rutile Mining Co. of Florida near Jacksonville and from the property of the Florida Ore Processing Co. near Melbourne.

New York.—Production of ilmenite at Tahawus, Essex County, N. Y., by the National Lead Co. in 1949 slightly exceeded that in 1948 and thus established a new peak by a narrow margin. This property continued to be the leading producer in the world. A brochure prepared by the company, dated August 29, 1949, for distribution to an inspection party of the United Nations Conference on Conservation and Utilization of Resources, contained the following paragraph on production:

> Since beginning operation in 1942, 7,000,000 tons of ilmenite-magnetite ore have been mined from the MacIntyre open-cut. To accomplish this 5,000,000 tons of rock and soil were removed from this immediate area to make this ore available for open-cut mining. From this ore 1,000,000 tons of ilmenite and 3,000,000 tons of magnetite concentrates were produced. All of the ilmenite was shipped directly to processing plants, while 1,000,000 tons of the magnetite (iron ore) have been converted to sinter and 500,000 tons have been shipped as raw concentrate to various iron, steel and other manufacturers. At present, 1,500,000 tons of magnetite remain in stockpiles at the plant and are currently being shipped to steel companies.
>
> Technical progress is disclosing new uses for titanium and its derivatives, one of the most recent being the use of the metal itself in uses which combine the properties of stainless steel and aluminum. This promises increased demand for titanium ores, and continued operation of the MacIntyre Development for many years to come, with all the attendant benefits to its employees, the community in general, other supplier industries, the people of the State of New York, and the Nation.

North Carolina.—The Yadkin Mica & Ilmenite Co., subsidiary of the Glidden Co., produced 31,364 tons of ilmenite (averaging 51 percent TiO_2) at Finley, Caldwell County, N. C., and shipped 31,714 tons. The 1949 output and shipments were 8 and 10 percent, respectively, above 1948. Production in 1949 was at a new record rate, marked a continuous rise since 1946, and was 83 percent above that year.

Virginia.—Ilmenite and rutile were produced again in 1949 near Roseland, Nelson County, Va., by the American Rutile Corp., subsidiary of the Metal & Thermit Corp. This property closed in July;

[2] Thoenen, J. R., and Warne, J. D., Titanium Minerals in Central and Northeastern Florida: Bureau of Mines Rept. of Investigations 4515, 1949, 62 pp.

the corporation was in process of liquidation early in 1950 owing to the fact that the grade of ore mined at Roseland is too low to be profitable. The Calco Chemical Division of American Cyanamid Co. continued to produce ilmenite at Piney River, also in Nelson County.

CONSUMPTION AND USES

Consumption of ilmenite dropped 10 percent in 1949 and thus failed to establish a new peak for the first time in 7 years; except for 1948, the rate of use in 1949 was at a higher level than ever before. The manufacture of pigments, as usual, took 99 percent of all ilmenite consumed. In addition a high percentage of the rutile used was consumed in the manufacture of pigments. Actually the material so used was a mixed product containing altered ilmenite, leucoxene, and rutile, which in titanium dioxide content resembled rutile more closely than ilmenite. The total tonnage shown as rutile was 16 percent above 1948, but the quantity for customary rutile uses dropped in 1949.

Consumption of ilmenite and rutile in the United States, 1941–46 (total) and 1947–49, by poducts, in short tons

Product	Ilmenite		Rutile

[1] "Pigments" include all manufactured titanium dioxide, consumption of which in welding-rod coatings was 1,[illegible]57 tons in 1947, 1,338 tons in 1948 and 1,082 tons in 1949.
[2] Bureau of Mines not at liberty to publish; figures included in "Miscellaneous."
[3] Revised figures. Includes rutile used to make pigments.
[4] Revised figures
[5] Includes a mixed product containing altered ilmenite, leucoxene, and rutile, used to make pigments and metal.

Titanium Pigments.—Production and shipments of titanium pigments in 1949 dropped somewhat from 1948, following the establishment of five successive peaks; except for 1948, both items were at the highest annual rates ever attained. Figures on this industry are supplied in confidence and, consequently, are not given here. As already stated, a mixed product containing altered ilmenite, leucoxene, and rutile, produced at a domestic mine was used in 1949 chiefly in the manufacture of pigments.

Distribution of titanium pigments shipments, by industries, 1935–49, in percent of total

Metal.—Titanium metal was produced on a commercial basis at Newport, Del., by E. I. du Pont de Nemours & Co. for the second successive year. One pilot plant was operated continuously at approximately 100 pounds a day throughout the year and a second pilot plant of somewhat larger capacity went into production near the close of the year. Bureau of Mines produced metal at the rate of 200 pounds a week, except for several brief interruptions. Early in the year most of the output was in the form of powder, but at the end of the year production was largely in the form of sponge. A pilot plant for metal production was under construction at Sayreville, N. J., by the National Lead Co. at the end of 1949 and began to produce early in 1950. The potential uses of titanium metal were recently discussed.[3] The authors indicated that although this relatively new metal with unique and highly desirable properties has a promising future, its production today is too costly to warrant the conclusion that it will have almost

[3] Ralston, Oliver, and Cservenyak, F. J., Potential Uses of Titanium Metal: Ind. Eng. Chem., vol. 42, No. 2, February 1950, pp. 214–218.

universal applications and compete with steel, aluminum, and copper where these cheaper metals can function satisfactorily.

Welding-Rod Coatings.—Production of titanium-coated welding rods was 154,000 short tons in 1949, a drop of 18 percent from the 188,000 tons for 1948; 153,000 tons were coated in 1947, 133,000 in 1946, and 481,000 in 1943. Of the 1949 tonnage, 54 percent was coated with natural rutile, 33 percent with manufactured titanium dioxide, and nearly 7 percent each with both varieties and with ilmenite.

Other Uses.—In a recent article[4] it was pointed out that alkyl titanates, derived from the action of titanium tetrachloride on alcohols, are very effective waterproofing agents. These compounds, the titanium analogs of alkyl silicates, are capable of imparting a water-repellent finish to such diverse materials as paper, cotton, wool, rayon, nylon, silk, felt, and wood.

An article[5] stated that, although the superior qualities of titanium dioxide as an opacifier have been known for many years, its commercial utilization as the major opacifying agent in porcelain enamels is a comparatively recent development. The development and physical properties of these enamels were discussed. The fact that the enamels are applied directly to the metal without the need of an intermediate ground coat was said to be an outstanding development. Another article[6] discussed the standards and practices that permit application of titanium enamel to steel without the use of a ground coat. A development of increasing scientific and technical importance, another article[7] stated, was the electromechanical effect exhibited by barium titanate ceramics under the influence of a high electric polarizing field. Titanate ceramics, the author said, have become an important raw material for the manufacture of capacitors, especially in certain types of high-voltage condensers, such as those used in televison sets.

Titanium carbides were discussed in articles[8] appearing recently. Experiments were conducted on the preparation of metal-ceramic seals by use of brazing alloy and a flux of titanium hydride in an atmosphere of highly purified hydrogen.[9]

Efforts to form single crystals of rutile were described[10] in recent literature. Synthetic rutile for use as gem stones is an outgrowth of such investigations.

STOCKS

Inventories of ilmenite rose 33 percent in 1949 and were equivalent to 15 months' requirements at the record rate of consumption maintained in 1948; they were adequate for 17 months at the 1949 rate.

[1] Includes ilmenite and rutile content of mixed zirconium-titanium concentrates.

PRICES

The average E&MJ Metal and Mineral Markets quotation per gross ton for ilmenite containing 56–59 percent TiO_2, f. o. b. Atlantic seaboard, dropped from a range of \$18–\$20, according to grade and impurities, at the beginning of the year to \$16–\$18 in early October, to \$15–\$17 late in that month, and further to \$14–\$16 in the first half of November. There were no further changes in 1949. Quotations were given as nominal. Nominal quotations for rutile, guaranteed minimum 94-percent concentrate, after continuing at 8–10 cents a pound for a number of years fell to 6–8 cents in December 1948, to 4–6 cents in May 1949, and further to 4–5 cents by the end of the year.

According to the magazine Steel, quotations for ferrotitanium were unchanged throughout 1949, as follows:

Ferrotitanium, Low-Carbon: (Ti 20–25 percent, Al 3.5 percent maximum, Si 4 percent maximum, C 0.10 percent maximum). Contract, ton lots, 2″ x D, \$1.40 per pound of contained Ti; less ton \$1.45. (Ti 38–43 percent, Al 8 percent maximum, Si 4 percent maximum, C 0.10 percent maximum). Ton lot \$1.28, less ton \$1.35, f. o. b. Niagara Falls, N. Y., freight allowed to St. Louis. Spot add 5¢.

Ferrotitanium, High-Carbon: (Ti 15–18 percent, C 6–8 percent). Contract \$160 per net ton, f. o. b. Niagara Falls, N. Y., freight allowed to destination east of Mississippi River and north of Baltimore and St. Louis.

Ferrotitanium, Medium-Carbon: (Ti 17–21 percent, C 3–4.5 percent). Contract, \$175 per ton, f. o. b. Niagara Falls, N. Y., freight not exceeding St. Louis rate allowed.

Titanium metal, 96–98 percent, was quoted at \$5–\$6 a pound from mid-September 1948 through September 1949, after which it was quoted for the remainder of the year at \$5.

Manufactured titanium dioxide (anatase), chalk-resistant, plain, and (rutile) nonchalking, in bags, carlots, delivered, were quoted in Oil, Paint and Drug Reporter throughout the year at 19½, 19½, and 21½ cents a pound, respectively. Beginning October 31, quotations on a ceramic grade were added; this grade was quoted at 19½ cents a pound from then to the end of the year.

FOREIGN TRADE [11]

From a tonnage standpoint, foreign trade in titanium materials is preponderantly of imports of the crude products, ilmenite and rutile. Exports are largely of titanium dioxide; the values of exports of this class and of ferrotitanium far exceed the combined values of receipts of ilmenite and rutile from abroad.

Imports.—Receipts of ilmenite established a new record in 1949, being 34 percent higher than in 1948 and 8 percent above the previous

[1] Classified as "ore" by the U. S. Department of Commerce.
[2] Most of the imports of titanium from Australia in 1940–47 were in mixed zircon-rutile ilmenite concentrates. Totals of mixed concentrates are derived by addition of the U. S. Department of Commerce figures for imports of ilmenite, rutile, and "zirconium ore" from Australia. These totals are apportioned by the Bureau of Mines (on the basis of surveys of importers) into the 3 component minerals. The excess quantities of ilmenite and rutile over the quantities reported by the U. S. Department of Commerce in those specific categories are entered as "In 'zirconium ore.'"
[3] Most of the ilmenite, rutile, and zircon from Australia in 1947 was imported in the form of zircon-rutile or zircon-rutile-ilmenite mixed concentrates. These concentrates (including separated concentrates of a single mineral) totaled 36,074 short tons, of which 1,659 were ilmenite, 12,521 rutile, and 21,894 zircon. For statistical convenience, it can be assumed that 5,061 tons of the material reported by the Department of Commerce as ilmenite was actually rutile; the value of this 5,061 tons of rutile, however, is inseparable from the ilmenite as reported.
[4] Less than 1 ton.
[5] Includes 209 tons not recovered from mixed concentrates.
[6] Revised figure.
[7] Includes quantities reported by the U. S. Department of Commerce as originating in French Equatorial Africa, from which no rutile production has been recorded.

[11] Figures on imports and exports compiled by M. B. Price and E. D. Page, of the Bureau of Mines, from records of the U. S. Department of Commerce.

peak in 1947. Imports from India, always by far the dominant source, were likewise at a new top, having exceeded slightly the previous high in 1939. Imports from Norway, which had been rising, dropped 20 percent in 1949. Norway supplied 10 percent of the 1949 total and was the only source of consequence outside of India. Brazil and Malaya, which sent significant quantities to the United States in 1948, did not appear on import declarations in 1949. Only 38 short tons of ferrotitanium were entered in 1949, all from the United Kingdom.

All imports of rutile again were from Australia; little more than one-third of the 1948 quantity was received in 1949.

Exports.—Shipments of titanium materials from the United States consist largely of titanium pigments. The uptrend in exports of this item, in virtually continuous progress since the movement began prior to 1939, reached a new high level in 1949. Exports totaled 29,621 tons in 1949 or considerably more than double the quantity for 1945. Canada was by far the chief destination of titanium dioxide exports with 19,653 tons, and next in importance were Brazil with 1,577 tons, France 1,409, Belgium-Luxembourg 1,150, Mexico 959, Cuba 859, Netherlands 770, followed by 49 other countries with smaller quantities. Exports of concentrates totaled 1,505 tons, of which Canada received 904, Netherlands 386, Belgium-Luxembourg 132, and four other countries the remainder. Canada received 127 tons of the ferro-alloys exported and Belgium-Luxembourg 28; insignificant quantities went to six others.

Exports of titanium products from the United States, 1942–44 (average) and 1945–49, by classes

[U. S. Department of Commerce]

[1] Includes metal and nonferrous alloys.
[2] Beginning Jan. 1, 1946, not separately classified.

TECHNOLOGY

Treatment of titaniferous ores was the subject of reports published[12] recently.

Progress in research work on the development of a new method for

[12] Armant, D. L., and Cole, S. S., Laboratory Smelting of Titaniferous Ores: Jour. Metals, vol. 1, No. 12, December 1949, pp. 909–913.
MacMillan, Robt. T., Dinnin, Jos. L., and Conley, John E., Proposed Process for Treatment of Low-Grade Titaniferous Ores: Bureau of Mines Rept. of Investigations 4638, 1950, 19 pp.

preparing lower-cost titanium tetrachloride and preparing titanium oxide pigment was reported[13] in 1949.

Bureau of Mines production of metallic titanium was described.[14] The report states that—

> To produce ductile titanium by powder metallurgy, the method used by the Bureau, it is necessary to start with powder free from gaseous impurities. Although hydrogen, if present, can be removed completely enough for all practial purposes by heating the metal in a high vacuum, no method of removing nitrogen or oxygen is yet known. To prevent contamination, therefore, the titanium tetrachloride from which the powder is produced is treated in equipment so designed that the titanium comes in contact only with iron and helium during production. After it has cooled to room temperature, exposure of titanium to air does no material harm.

The history of titanium tetraiodide was recently reviewed[15] and a new method of its preparation described. The authors stated:

> The practical importance of titanium tetraiodide increased greatly when van Arkel and de Boer showed that it could be thermally decomposed by impingement of the vapors on a highly heated tungsten wire, with the building up of a rod of pure titanium metal and the liberation of elementary iodine. To date, the best ductile titanium metal has been produced by the van Arkel-deBoer method.

Several recent articles[16] bore on the properties of titanium metal and also on the effects of other elements thereon. A résumé of current findings in connection with titanium and titanium alloys was recently made available.[17] Many other articles on titanium alloys also were released, of which some are listed.[18]

WORLD REVIEW

Available data on world production of ilmenite and rutile in recent years are shown in the accompanying table.

[5] Approximately 20 percent of ilmenite concentrates is zircon.

Australia.—A plant for the production of titanium pigments was completed [19] by Australian Titan Products, Ltd., subsidiary of British Titan Products Co., Ltd., near Burnie, Tasmania, in 1949. Initial output of 5 tons daily (about 1,800 annually) was anticipated; this was expected to be increased by 1951 to 10 tons daily. Indian ilmenite was being used, but experiments with Australian concentrate were in progress. Titanium dioxide was produced [20] experimentally in 1949 from Australian rutile by Zircon Rutile, Ltd., at South Yarra, Victoria. Construction of a larger plant was under consideration. Australia has produced [21] experimental quantities of titanium metal. Research work has been carried out by the Australian Council for Scientific and Industrial Research. Technology of production of the metal in the form of rod, wire, and sheet has been developed by the Physical Metallurgy Section of the council in collaboration with the University of Melbourne.

Canada.—Progress in 1949 was reported in development of the Allard Lake property by the Quebec Iron & Titanium Corp.—owned two-thirds by the Kennecott Copper Corp. and one-third by the New Jersey Zinc Co. At the end of the year the 27-mile railway from Harve St. Pierre to the mine was more than half completed, and construction of harbor facilities was well under way, according to Kennecott's annual

[19] Queensland Government Mining Journal, Zircon-Rutile-Ilmenite: Vol. 50, No. 573, July 1949, pp. 375–376.
[20] Oil, Paint and Drug Reporter, Trade Briefs: Vol. 156, No. 4, July 25, 1949, p. 66.
[21] Metal Industry, Australia Titanium Supply: Vol. 75, No. 19, Nov. 4, 1949, p. 408.

report to stockholders. Construction of the wharf and smelter at Sorel, on the south bank of the St. Lawrence River, was in progress, as was construction of the power line from Three Rivers. If the present schedule is maintained in 1950, as anticipated, one furnace of the five now contemplated, should be in operation in 1951. The over-all expenditure to bring the property to the anticipated daily production of 1,500 tons of ilmenite, to yield 500 tons of iron and 700 tons of titanium dioxide, now is expected to be $30,000,000. The company's annual production target was 550,000 tons of ore, from which the furnaces at Sorel would yield 175,000 tons of high-grade iron and 250,000 tons of titanium oxide slag, averaging over 70 percent TiO_2.

Dominion Magnesium, Ltd., began production of titanium metal in September 1948 at its Government-built pilot plant at Haley, Ontario, using the Pidgeon-Rostrom process, claimed to be considerably cheaper than other processes. Ingots of 25 to 200 pounds of metal of 99.5–99.6 percent purity are being produced occasionally for Government experimental work.

Ceylon.—From time to time the reports of this series have indicated that consideration was being given to the production of ilmenite from extensive black beach sands in Ceylon. Several reports in 1949 indicated that the Government proposed erecting a milling plant; and one, at least, indicated [22] that a plant for the production of pigments was under consideration. Plans were for exploitation first of the sands at Pulmoddai in the Trincomalee district.

India.—Before World War II, India led all other countries by a substantial margin in the production of ilmenite. The disruption to international trade, caused by World War II, resulted in establishment of the United States as the leading world producer of this product. Concern has been expressed in India over the possible loss of the United States market as an outlet for Indian ilmenite exports, but the shipment of new peak quantities of these concentrates to the United States in 1949 showed that the fears were premature and perhaps entirely unwarranted.

United Kingdom.—Imports of titanium ores into the United Kingdom were reported as 75,693 long tons in 1949 compared with 57,247 in 1948 and 71,250 in 1947.

Tungsten

By Hubert W. Davis

GENERAL SUMMARY

A SUBSTANTIAL decline in the output of high-speed steels and of tungsten powder and much smaller exports of ferrotungsten in 1949 were largely responsible for a 44-percent drop in consumption of tungsten concentrates. Shipments of Class A (1.8 to 6 percent W) and Class B (19 to 22 percent W) high-speed steels declined 55 and 44 percent, respectively, from 1948, production of tungsten powder was about one-third less, and exports of ferrotungsten dropped 51 percent. To conform to the lessened demand, some domestic mines suspended operations, and production rates at most of the others were reduced. As a consequence, domestic output and shipments of tungsten concentrates (60 percent WO_3 basis) were 3,043 and 2,765 short tons, respectively, in 1949—decreases of 28 and 31 percent from 1948. California was again the premier tungsten-producing State, and North Carolina displaced Nevada as the second largest. The Tungsten Mining Corp. in North Carolina rose to first place among United States producers of tungsten concentrates in 1949. Despite the much smaller demand for tungsten concentrates in 1949, the price for domestic concentrates was virtually the same as in 1948.

Salient statistics of tungsten ores and concentrates in the United States, 1945–49, in pounds of contained tungsten

Year	Production	Shipments from mines	Imports for consumption	Consumption	Industry stocks at end of year		
					Producers	Consumers and dealers	Total
1945	5,388,639	5,266,818	4,773,861	14,146,000	557,042	3,784,429	4,341,471
1946	4,671,042	4,942,282	6,869,438	6,458,000	285,865	3,694,256	3,980,121
1947	3,026,470	2,944,622	6,018,005	7,812,000	368,316	3,343,392	3,711,708
1948	[1] 4,033,389	[1] 3,858,287	7,548,101	8,853,000	563,418	5,284,901	5,848,319
1949	2,896,084	2,681,506	6,274,102	4,958,000	827,045	4,229,444	5,056,489

[1] Revised figure.

Imports of tungsten ores and concentrates for consumption in the United States were also much smaller than in 1948; they were 6,592 short tons (60 percent WO_3 basis), a decline of 17 percent from 1948. Asia, chiefly China, supplied 89 percent of the total imports in 1949 and 9 percent more than in 1948. Imports from South America, however, were 77 percent smaller. Of the total imports, 3,562 tons (60 percent WO_3 basis) from China were duty-free for the United States Government. The quoted price on imported ores and concentrates was much lower in 1949 than in 1948.

Consumption of tungsten concentrates (60 percent WO_3 basis) in the United States was 5,210 short tons in 1949, compared with 9,300 tons in 1948. Usage of tungsten concentrates for conversion to ferrotungsten, for direct charge to the steel bath, and for the production of tungsten-metal powder and other tungsten products was much less than in 1948, but the decline was most pronounced for direct charge to the steel bath.

Industry stocks of tungsten concentrates (60 percent WO_3 basis) were 5,313 short tons on December 31, 1949, compared with 6,145 tons at the end of 1948.

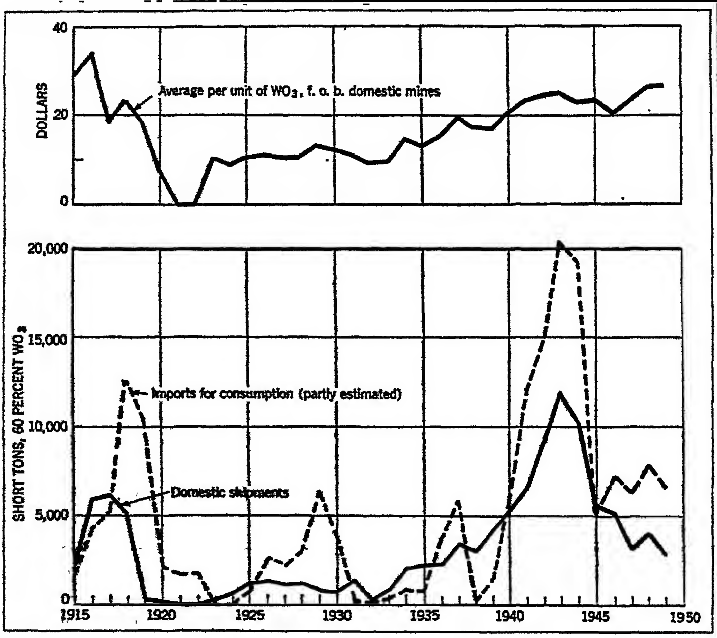

FIGURE 1.—Trends in domestic shipments, imports, and average price of tungsten ores and concentrates, 1915–49.

DOMESTIC PRODUCTION

The tungsten ore mined and milled in the United States, in general, contains 0.5 to 2.5 percent WO_3 and is beneficiated to a concentrate containing 60 percent or more WO_3. The leading tungsten producers and many small operators depend on ore carrying tungsten only as scheelite (calcium tungstate). Hübnerite (manganese tungstate), wolframite (iron-manganese tungstate), and ferberite (iron tungstate), in the order listed, contributed smaller quantities of the tungsten in domestic ore mined in 1949. Most of the concentrates are converted to ferrotungsten and tungsten powder. Some high-purity concentrates, however, are charged directly to the steel bath.

To conform to the lessened demand for tungsten in 1949, some mines suspended operations, and the production rates at most of the others were reduced. As a consequence, output of concentrates (60 percent WO_3 basis) declined to 3,043 short tons in 1949 compared with 4,238 tons (revised figure) in 1948. Production in 1949 was obtained from many widely scattered operations in nine States and Alaska, but three States—California, Nevada, and North Carolina—supplied 86 percent of the total; and seven operators—Bradley Mining Co., Climax Molybdenum Co., Nevada-Massachusetts Co., Nevada Scheelite, Inc., Surcease Mining Co., Tungsten Mining Corp., and United States Vanadium Corp.—produced 92 percent of the United States total. California was again the premier tungsten-producing State, and North Carolina displaced Nevada as the second largest. The Tungsten Mining Corp. in North Carolina ascended to first place among United States producers of tungsten concentrates in 1949.

Tungsten concentrates produced and shipped in the United States, 1948–49, by States

State	Production				Shipments from mines

[1] Less than one-half ton.
[2] Less than 0.01 percent.
[3] Revised figure.

Alaska.—J. H. Scott Co. produced (but did not ship) a small quantity of tungsten concentrate averaging about 50 percent WO_3 at the Riverside mine near Hyder, Alaska, in 1949.

Arizona. Small quantities of concentrates (10 and 12 units of WO_3, respectively) were produced and shipped from two properties in Arizona in 1949.

California.—California again was the premier tungsten-producing State; nevertheless, output was 39 percent less than in 1948. Production of concentrates was 952 short tons averaging 68.3 percent WO_3 in 1949, compared with 1,542 tons averaging 69.2 percent WO_3 in 1948. Shipments of tungsten concentrates totaled 839 short tons averaging 68.1 percent WO_3 in 1949, compared with 1,549 tons averaging 68.4 percent WO_3 in 1948. Although concentrates were produced at a number of widely scattered operations, five producers (Consolidated Tungsten, Fresno Mining Co., O. A. Kittle Mining & Exploration Co., Surcease Mining Co., and United States Vanadium Corp.) supplied 93 percent of the State total. The bulk of the remainder was contributed by Adams & Van Voorhis, Alpine Mining Co., California Tungsten Mines, Sheridan & Bennett, Sherman Peak Mining Co., Tulare County Tungsten Mines, and Tungstar Corp.

The Pine Creek mine and concentrator of United States Vanadium Corp. near Bishop were operated at greatly reduced rates in 1949; consequently, the quantities of ore mined and concentrates produced were 30 and 40 percent, respectively, less than in 1948. The laying of 36-inch-gage track in the 7,240-foot low-level adit was completed in 1949.

Surcease Mining Co. closed its Spud Patch placer operation at Atolia in June 1949 but continued production through lease arrangements at other properties in San Bernardino County. Chiefly as a result of discontinuing operation at the Spud Patch placer, the output of concentrate in 1949 was 43 percent smaller than in 1948.

The Harrel Hill mine in Tulare County, operated by Consolidated Tungsten, produced 21 percent more tungsten concentrate in 1949 than in 1948.

Output at the Round Valley mine in Inyo County, operated by the O. A. Kittle Mining & Exploration Co., was 5.3 times that in 1948. Operations were discontinued on December 31, 1949.

The Alpine mine in Alpine County, operated by Alpine Mining Co., the Strawberry mine in Madera County, operated by Fresno Mining Co., and the Big Jim mine in Tulare County, operated by Tulare County Tungsten Mines, operated at much lower rates in 1949 than in 1948. At the Strawberry mine an electric hoist was installed, and two Diester-type and one Wilfley-type tables and a 225-horsepower Diesel were added to the mill.

The Black Rock mine in Mono County, operated by Tungstar Corp., the Yaney mine in Inyo County, operated by Adams & Van Voorhis, a property in Tulare County, operated by California Tungsten Mines, and the Sherman Peak mine (also in Tulare County), operated by Sherman Peak Mining Co., produced small quantities of tungsten concentrates in 1949.

Colorado.—Production and shipments of tungsten concentrates (60 percent WO_3 basis) in Colorado were 220 and 222 short tons, respectively, in 1949 compared with 198 and 208 tons, respectively, in 1948.

The Climax Molybdenum Co., which began recovery of the very small tungsten content of its molybdenite ore at Climax, Lake County, in May 1948, was the chief producer of tungsten concentrates in Colorado in 1949; its output was 36 percent greater than in 1948.

Comparatively small quantities of tungsten concentrates were produced by leasers in Boulder County.

Idaho.—The Bradley Mining Co., operating the Ima mine in Lemhi County, Idaho, produced 158 short tons of hübnerite concentrate averaging 71 percent WO_3 in 1949. The new concentrator to serve the Ima mine [1] was completed and put into operation in January 1949; it replaced one destroyed by fire December 10, 1947.

Missouri.—A small quantity of tungsten concentrate was shipped from stock by the And-Mor Mining Co. in 1949.

Montana.—The H & H Mines, Inc., worked gravel containing scheelite and gold in lower Henderson Creek near Drummond, Granite County, Mont., in 1949; production of concentrate was 8 short tons averaging 67.91 percent WO_3 compared with 26 tons (revised figure) averaging 63.01 percent WO_3 in 1948.

Nevada.—Nevada dropped from second to third place as a tungsten-producing State in 1949. Production of concentrates was 483 short tons averaging 74 percent WO_3 in 1949 compared with 1,076 tons averaging 70 percent WO_3 in 1948. Shipments were 606 tons averag-

[1] Mecia, J. A., Ima Mine Resumes Operations: Min. Cong. Jour., vol. 35, No. 4, April 1949, pp. 88–92, 122.

ing 73 percent WO_3 in 1949 compared with 874 tons averaging 65 percent WO_3 in 1948.

The Nevada-Massachusetts Co. again was the largest producer of tungsten concentrates in Nevada in 1949, but because of suspension of operations from July 1 through the remainder of the year its output was 52 percent less than in 1948. Shipments of concentrate, however, were only 8 percent smaller.

Nevada Scheelite, Inc., operating a mine of the same name in Mineral County, again was the second-largest producer of tungsten concentrates in Nevada. However, the operating rate was reduced substantially on March 15 and, as a consequence, the output of concentrates in 1949 was about half that in 1948.

The chief smaller producers of concentrates in 1949 were the Cherry Creek Mining Co., operating the Cherry Creek mine in White Pine County; the Lincoln Mining Co., operating the Lincoln mine in Lincoln County; and Minerva Scheelite Mining Co., operating the Scheelite Chief mine in White Pine County.

North Carolina.—The Tungsten Mining Corp., operating the Hamme mine in Vance County, N. C., ascended to first place among United States producers of tungsten concentrates in 1949. Output was 921 short tons averaging 61.35 percent WO_3 in 1949 compared with 969 tons averaging 58.32 percent WO_3 in 1948. Shipments by the company were 783 tons averaging 59.03 percent WO_3 in 1949 compared with 986 tons averaging 58.65 percent in 1948. During 1949 the company did 5,983 feet of diamond drilling and 4,118 feet of development. Its new central shaft was sunk 570 feet. The 300- and 500-foot levels of the No. 4 shaft were connected with the Central shaft, which was also connected with the No. 2 shaft at the 300-foot level. The Sneed No. 1 ore body was opened and mined on the 200-foot level. Several small ore bodies were found, including one in the schist which heretofore had not been considered favorable for ore occurrences. An improvised leaching unit for treatment of concentrates was installed in the mill.

Oregon.—A small quantity of tungsten concentrate was produced from ore mined by L. A. Bratcher from a property in Jackson County, near Ashland, Oreg., in 1949. The ore was concentrated by the Tulare County Tungsten Mines at its mill near Lindsay, Calif.

Utah.—A small quantity (31 units of WO_3) was produced by the Star Dust Mines, Inc., operating the Star Dust Mines in Tooele County, near Gold Hill, Utah, in 1949.

CONSUMPTION

Consumption of tungsten concentrates (60 percent WO_3 basis) in the United States was 5,210 short tons in 1949 compared with 9,300 tons in 1948. Of the total consumed in 1949, 2,472 tons (47 percent of the total) were converted to ferrotungsten, the form in which most of the tungsten is introduced into steel. However, high-purity tungsten concentrates are charged directly to the steel bath; 838 tons (16 percent) were so used in 1949. Tungsten-metal powder and other tungsten products, chiefly the former, utilized 1,900 tons or 37 percent of the total concentrates consumed in 1949.

PRICES

Prices on imported tungsten concentrates were, in general, downward in 1949. According to the Engineering and Mining Journal, quotations on imported concentrates ranged from $25.25 to $18 a short-ton unit of WO_3, duty paid. On the other hand, domestic scheelite of good known analysis, in carlots, delivered, was quoted at $28.50 a unit throughout 1949. The use of high-purity scheelite for direct smelting has placed a premium on this type of concentrate. As reported to the Bureau of Mines, the average price for domestic concentrates shipped was $26.38 a short-ton unit of WO_3 in 1949.

FOREIGN TRADE [2]

Domestic production is inadequate for requirements, and the United States imports both tungsten concentrates and products, chiefly the former. General imports (receipts) of ores and concentrates into the United States totaled 7,357,299 pounds (tungsten content), equivalent to 7,731 short tons of 60 percent WO_3 in 1949, a 25-percent decline from 1948. This quantity represents the ores and concentrates received in the United States, irrespective of final disposition. Although ores and concentrates were received from 13 foreign countries in 1949, 4 countries—China (68 percent), Bolivia (14 percent), Thailand (8 percent), and Korea (4 percent)—supplied 94 percent of the total.

Imports of ores and concentrates for consumption in the United States were 6,274,102 pounds (tungsten content), equivalent to 6,592 short tons of 60 percent WO_3 in 1949, a 17-percent decline from 1948. Imports for consumption represent ores and concentrates on which the duty has been paid and which have thereby entered into the domestic commerce of the United States and concentrates which enter duty free for the United States Government. China (73 percent), Korea (8 percent), and Thailand (6 percent) supplied 87 percent of the total. Of the total imports, 3,562 tons (60 percent WO_3) from China were duty free for the United States Government.

In 1949, 434 short tons (60 percent WO_3) of ores and concentrates were withdrawn from warehouses for smelting, refining, and export (972 tons in 1948), and 939 tons (gross weight) were reexported (391 tons in 1948). Ores and concentrates withdrawn for smelting, refining, and export and for reexport are free of duty.

The duty on tungsten ores and concentrates is 38 cents a pound on the metallic tungsten contained therein. This is equivalent to $6.03 a short-ton unit.[3]

Exports of tungsten ores and concentrates from the United States were 102 short tons (gross weight) in 1949, compared with 415 tons in 1948. Of the 1949 exports, 55 tons went to Italy, 30 tons to United Kingdom, 17 tons to Germany, and 13 pounds to Canada.

Imports of tungsten metal were 13,455 pounds in 1949 (224 pounds in 1948). Imports of ferrotungsten, chiefly from Korea, were 61,993

---

[2] Figures on imports and exports compiled by M. B. Price and E. D. Page, of the Bureau of Mines, from records of the U. S. Department of Commerce.

[3] A unit, as applied to tungsten ores, is 1 percent of a ton of contained tungsten trioxide (WO_3). Thus, a short-ton unit is 20 pounds of WO_3 or 15.86 pounds of tungsten (W).

Tungsten ores and concentrates imported into the United States, 1948–49, by countries

[1] Comprises ores and concentrates received in the United States; part went into consumption during year, and remainder entered bonded warehouses.
[2] Comprises ores and concentrates withdrawn from bonded warehouses during year (irrespective of time of importation) and receipts during year for consumption.
[3] Revised figure.

pounds containing 45,295 pounds of tungsten in 1949 (none in 1948). There were no imports of tungstic acid, tungsten carbide, or combinations containing tungsten or tungsten carbide in 1948 or 1949.

Exports of ferrotungsten were 620,645 pounds (gross weight) in 1949 (1,255,435 pounds in 1948). Exports of tungsten metal, stellite, wire, shapes, and alloys other than ferrotungsten were 106,860 pounds in 1949 (181,956 pounds in 1948).

WORLD REVIEW

The accompanying tables show production of tungsten ores, by countries, from 1905 through 1948; figures before 1905 are not available. Despite the fact that production in China did not begin until 1914, it has been the premier tungsten-producing country and has

supplied 28 percent of the world total during the 44 years 1905–48. The United States has been the second-largest producing country, but it has contributed only 13 percent of the world total. Burma has ranked third as a tungsten-producing country and has accounted for nearly 13 percent of the world total. Thus, China, the United States, and Burma have furnished nearly 54 percent of the world total. Bolivia, Portugal, and Korea, in the order named, have been the largest of the other producing countries and, together, have supplied 22 percent of the world total.

World production of tungsten ores, by countries, 1905–48, in metric tons of concentrates containing 60 percent WO_3

[Figures for a few countries for certain years represent exports or shipments rather than production, and fiscal years rather than calendar years]

[1] Less than 0.01 percent.
[2] Excludes production for 1929–38.
[3] Excludes production in U. S. S. R. for 1929–38.

Argentina.—Argentina formerly ranked as the second-largest producer of tungsten in South America. However, since 1943, output (60 percent WO_3 basis) has declined continuously from 2,390 metric tons to 457 tons in 1946, when production virtually ceased. The marked decline in tungsten operations has resulted chiefly from high cost of production.

Australia.—During the year ended October 31, 1949, the King Island Scheelite, N. L., milled 158,384 long tons of scheelite ore averaging 0.59 percent WO_3, which yielded 971 tons of concentrate averaging 67.51 percent WO_3. In the corresponding year 1948 it milled 142,641 tons of ore averaging 0.6 percent WO_3, which yielded 592 tons of concentrate. The increase in production of concentrate resulted largely to improved mill recovery, which was 72.2 percent in 1949. A low-grade concentrate is stored for future treatment. Company sales of concentrate were 862 tons in 1949 (525 tons in 1948). Ore reserves were estimated at 2,790,000 tons on October 31, 1949. The mine, which is on King Island, Tasmania, in Bass Strait, is worked by open-pit methods and is served by a treatment plant (capacity, 20,000 tons of ore monthly) comprising gravity units and a flotation section. Alterations were made in the mill, and classifiers in the ball-mill circuit were replaced by Hummer screens; as a result, there has been a reduction of slime in the ball mills and an improvement in the mill recovery.

Bolivia.—Bolivia continued to be the largest tungsten producer in South America. Output (as indicated by exports) was 2,543 metric tons (60 percent WO_3 basis) in 1949 compared with 2,485 tons in 1948.

Brazil.—Brazil continued to be the second-largest producer of tungsten in South America, but output declined for the fifth successive year. Output (as indicated by exports) of concentrates (65 percent WO_3) declined to 531 metric tons in 1949 from 1,056 tons in 1948.

Burma.—Production of wolframite and mixed tin and wolframite concentrates in Burma was 1,308 metric tons in 1949 compared with 2,500 tons in 1948.

Because of unsettled political conditions in Burma, full-scale production was not attained at the Mawchi mine in 1948 and 1949, when only 836 and 794 long tons, respectively, of tin-wolfram concentrates were produced. Operations at the Mawchi mine were suspended in June 1949.

China.—Production figures for China, the premier tungsten-producing country, are not available for 1949, but 5,212 short tons (60 percent WO_3 basis) were received in the United States.

France.—A promising deposit of wolframite was reported [4] to have been discovered near Confolens in the Department of Charente.

Korea.—Production of tungsten concentrates (60 percent WO_3 basis) in South Korea was 1,448 metric tons in 1949 compared with 1,245 tons in 1948. Plans have been made, it is reported,[5] to replace the existing recovery facilities at the Sangdong mine with modern equipment which would result in a substantial increase in production of tungsten concentrates.

Peru.—Production of tungsten concentrates in Peru declined substantially in 1949 and was the smallest since 1939. Output (60 percent WO_3 basis) was 250 metric tons in 1949 compared with 353 tons in 1948.

Portugal.—Portugal is the largest producer of tungsten in Europe, and the Panasqueira, Ribeira, and Borralha mines are the chief producers. Outputs of wolframite concentrates and mixed tin and wolframite concentrates were 2,604 metric tons in 1949 compared with 2,868 tons in 1948. Exports of wolframite concentrates, chiefly to England, were 3,590 metric tons in 1949 compared with 3,075 tons in 1948.

Uranium, Radium, and Thorium

By Jack W. Clark

GENERAL SUMMARY

AS THE second decade following discovery of uranium fission unfolded, it was evident that development of the socially beneficial aspects of atomic energy would continue to be secondary to military considerations. Announcement by President Truman in September of an atomic explosion in 1949 in the U. S. S. R. heightened international tensions through the realization that another major world power had probably begun production of atomic weapons. As an aftermath, the possibility of creating a superpowerful thermonuclear bomb was widely discussed. (See Lithium in the Minor Metals chapter of this volume.)

In the United States during 1949, notable gains were achieved in almost every phase of atomic energy activity, ranging from discovery of new uranium-ore deposits to production of fissionable materials, radioisotopes, and assembled weapons. Late in 1949 the Atomic Energy Commission announced that construction was underway on a "breeder" reactor designed to test the feasibility of creating, by a self-multiplying process, an appreciably larger quantity of fissionable plutonium than is presently obtainable from the type of piles operating at Hanford, Wash. In principle, such a "breeder" reactor will likewise determine whether or not thorium, an element more abundant than uranium, can be practicably transmuted into the fissionable uranium isotope, U–233. The results of this attempt to "breed" supplies of fissionable materials will help determine if nuclear fuels can be used within the foreseeable future as a competitive source of energy for nonmilitary power generation.

MINE AND MILL PRODUCTION

The carnotite-roscoelite deposits of southwestern Colorado, southeastern Utah, and northeastern Arizona have provided almost all of the domestic uranium ore produced to date. All mining operations are conducted by individuals or private companies. The AEC reported that during 1949 the number of operating mines increased 100 percent. Plants for processing the ores are operated by the Vanadium Corp. of America at Naturita and Durango, Colo.; the U. S. Vanadium Corp. at Rifle and Uravan, Colo.; and the Galigher Co. (for the AEC) at Monticello, Utah. The Monticello and Uravan facilities originally built for vanadium production, which have been inactive for several years, were redesigned and placed in operation in 1949, the former in September and the latter at the end of the year. A sixth plant at Hite, west of Blanding, Utah, which had been under construction in 1948–49 by the Vanadium Corp. of America, began operations in July 1949; the plant is designed to treat a copper-uranium ore peculiar to the area.

Exploratory diamond drilling on the Colorado Plateau by the AEC has been conducted since November 1947 through a contractual arrangement with the Geological Survey. From the inception of the program to the end of 1949 about 3,530 holes were drilled for a total of approximately 353,928 feet. Beginning in May 1949 the geological staff of the AEC began a similar program and had drilled a substantial footage by the year end. Before public land is drilled, it is withdrawn from private location by the Interior Department. Thus, by Public Land Order 565, dated March 4, 1949, an area of 32,000 acres was withdrawn for exploratory drilling in the vicinity of Blanding, Utah, and around the Monogram and Joe Dandy mines on the south flank of Paradox Valley, Colo. On the same date Public Land Order 494 restored to entry about 27,738 acres in the Beaver Mesa area near Gateway, Colo, which had previously been withdrawn for possible drilling.

Several significant discoveries of uranium ore were made in the United States during 1949. Early in the year secondary uranium minerals, chiefly autunite, were found extensively distributed in altered quartz monzonite, 7 miles northeast of Marysvale, Utah. Development was begun by the Bullion Monarch Mining Co. and the Vanadium Corp. of America and a stockpile of ore started. In July 1949 pitchblende was found in the Sunshine mine, Coeur d'Alene district, Idaho. Later, in August, a small uraninite-bearing vein was discovered in the Huron River gorge, Baraga County, in the Upper Peninsula of Michigan. The latter two finds apparently do not show commercial possibilities but are of importance in indicating the possible existence of two new uranium-bearing ore provinces. The Idaho Springs–Central City–Jamestown area of Colorado in the Front Range west of Denver is under intensive study by geologists of the Geological Survey and the AEC; the Quartz Hill mines near Central City reportedly produced 325 tons of pitchblende ore, containing about 50 tons U_3O_8, during the period 1872–1919.

Continued attention was paid by the AEC and the Geological Survey to study of low-grade uraniferous sediments known to occur over extensive areas in the United States. Most notable of these are the bituminous Chattanooga shales of Tennessee and Kentucky and the well-known, commercially worked phosphate deposits in Florida (Bone Valley formation) and in Idaho, Wyoming, Montana, and Utah (Phosphoria formation).

In a survey of domestic thorium resources, the monazite contents of placer deposits, principally in Idaho and California, were investigated by the Bureau of Mines, under contract to the AEC. Domestic output of monazite continued on a small scale in 1949 as a coproduct of the Florida titanium mining industry.

REFINERY AND REACTOR PRODUCTION

Uranium.—A plant for making brown oxide (UO_2) was placed in operation in 1949 and construction begun on a uranium metal works. Successful pilot-plant tests were made of newly devised processes for producing green salt (UF_4) and uranium hexafluoride; it is anticipated their eventual large-scale employment will cut production costs by about two-thirds and three-fifths, respectively. In mid-1949 the AEC reported the yield of U–235 from natural uranium had been increased and the cost of its extraction halved since 1947. U–235 is produced

at Oak Ridge, Tenn., in plants designated as K–25 and K–27. In August 1949 construction of a third unit, K–29, was begun; cost was estimated at $66,000,000. On December 2, 1949, the AEC announced that preliminary construction work for a fourth unit, K–31, to cost about $162,000,000, would begin almost immediately.

Plutonium.—A new reactor for production of plutonium was placed in operation at Hanford, Wash., in 1949 and a plutonium-metal fabrication plant completed. The AEC stated that, as a result of more efficient use of equipment, 40 percent more plutonium was being produced per dollar of operating cost than in 1947 and that the yield from a given quantity of feed material had increased.

Isotopes.—The Atomic Energy Commission reported significant improvements in isotope-production techniques, resulting in increased yields, greater purity of product, and higher specific activity.[1] Catalogs of isotopes available from the AEC were published.[2]

Isotopes shipped by the U. S. Atomic Energy Commission, by kinds, 1946–49, in number of shipments

Kind of isotope	1946 [1]	1947	1948	1949	Total
Iodine-131	68	495	978	1,537	3,078

Grand total isotopes	246	1,861	2,959	4,804	9,870

[1] Shipped by Manhattan District, Corps of Engineers, U. S. Army Service Forces.

Radium, Polonium, and Actinium.—International Rare Metals Refinery, Inc., Mount Kisco, N. Y., produces radium, radium–D, radon, and polonium and in 1949 announced recovery of actinium, a decay product of U–235. Vitro Manufacturing Co., Pittsburgh, Pa., reported shipments of radium bromide from stocks in 1949. Radium slimes from processing carnotite ore were sold in 1949 by S. W. Shattuck Chemical Co., Denver, Colo.

Thorium.—Compounds of thorium (principally nitrate and oxide) are prepared by Lindsay Light & Chemical Co., West Chicago, Ill., and Maywood Chemical Works, Maywood, N. J. The Norton Co., Worcester, Mass., produces electrically fused thoria and thoria refractory ware. Thorium metal is produced by the Bloomfield Lamp Division, Westinghouse Electric Corp., Bloomfield, N. J., and

CONSUMPTION AND USES

Weapons.—Development and stockpiling of atomic weapons were accelerated in 1949. Weapon production was placed on an industrial basis in contrast to former custom methods. The more effective type of weapons tested at Eniwetok Atoll, Marshall Islands, in 1948 were in production.

Industrial Power.—Attempts to evaluate the role, or cost, of nuclear energy in future power generation continue to lie in the realm of fancy until it has been demonstrated that the nuclear fuels plutonium and U–233 can be created economically, and in quantity, from the relatively abundant nonfissionable isotope of uranium, U–238, and the even more abundant element thorium (Th–232). In currently operating reactors using natural uranium (0.7 percent U–235, 99.3 percent U–238) some of the neutrons ejected by fission of U–235 are absorbed in nonfissionable U–238 to form plutonium; however, less plutonium is created than U–235 consumed. Under certain conditions, however, using enriched uranium (material in which the U–235 content is appreciably above that in natural uranium) in a pile, it is believed possible to create or to "breed" an appreciable excess of plutonium over the quantity of U–235 destroyed, thereby achieving a net gain in fissionable material. If such a multiplication process can be made to work with a high degree of efficiency, most of the common nonfissionable uranium isotope, U–238, could be converted to plutonium. Thorium (Th–232), unlike U–238, is not accompanied in nature by a spontaneously fissionable neutron-emitting isotope (U–235), so would require addition of such a substance to bring about its conversion to the fissionable element U–233. Once enough plutonium or U–233 has been created, each in turn is capable of performing the same function as U–235 in generating more nuclear fuel.

In view of the aforementioned considerations, great interest was aroused by the AEC announcement that construction of an experimental breeder reactor was to begin in December 1949 at its new 400,000-acre nuclear reactor testing station near Arco, Idaho. An important feature of the reactor will be the use of liquid metal as a heat-transfer medium. Total cost is estimated at $3,500,000. Construction is expected to be completed by the end of 1950.

Nuclear reactors now operating, under construction, or proposed for near-future construction in various countries

Country	Date of beginning operation	Fuel	Moderator	Coolant	Neutron velocity	Capacity kw.	Use
United States:							
Arco, Idaho	Construction begun December 1949.	Enriched uranium metal	(?)	Liquid metal	Fast	Very much higher than Los Alamos fast reactor.	Research in breeding fissionable material and in heat transfer.
Do	Proposed for construction in 1950.	Enriched uranium metal (?).	(?)	(?)	Fast (?)	(?)	Research in testing reactor construction materials.
Do	Proposed for construction in 1952.	Enriched uranium metal (?).	(?)	Liquid metal (?)	do	(?)	Research in power generation for ship propulsion.
Brookhaven, N. Y.	Under construction	Uranium metal	Graphite	Air	Slow	30,000	Research.
Chicago, Ill.	Dec. 2, 1942 (subsequently dismantled and rebuilt at a different site).	Uranium metal and oxide.	do	None	do	0.2	Research and radioisotope production.
Do	May 15, 1944	Uranium metal	Heavy water	Heavy water	do	300	Research.
Hanford, Wash.	4 piles; first 3 started operation 1944–45; fourth started July 1949.	do	Graphite	Water	do	Very much greater than 1,000.	Production of plutonium and radioisotopes.
Los Alamos, N. M.	1944	Enriched uranium salts	Water	do	Fast	10	Weapons research.
Do	(?)	Plutonium	(?)	(?)	do	(?)	Do.
Oak Ridge, Tenn.	Nov. 4, 1943	Uranium metal	Graphite	Air	Slow	2,000	Research and radioisotope production.
West Milton, N. Y.	Proposed for construction in 1950.	Enriched uranium metal (?).	(?)	Liquid metal	Intermediate	(?)	Research in breeding fissionable material and in power production.
Canada:							
Chalk River, Ont.	Sept. 5, 1945	Uranium metal	Heavy water	Heavy water	Slow	10,000	Research and radioisotope production.
Do	Proposed for near future construction.	(?)	do	(?)	(?)	(?)	(?).
France: Chatillon	Dec. 15, 1948	Uranium oxide	do	None	Slow	Few watts	Research.
Netherlands	Proposed	(?)	(?)	(?)	(?)	(?)	Power production.
Norway: Kjeller	Under construction	Uranium metal	Heavy water	(?)	Slow	100	Research and radioisotope production.
U. S. S. R. (?)	Later than 1945 (?)	Uranium metal (?)	Graphite (?)	Water (?)	Slow (?)	Large (?)	Production of plutonium and radioisotopes (?).
United Kingdom:							
Harwell	August 1947	Uranium metal	Graphite	Air	Slow	100	Research and radioisotope production.
Do	July 3, 1948	do	do	do	do	6,000	Do.
Sellafield	Construction reported suspended in 1949.	Uranium metal (?)	Graphite (?)	(?)	Slow (?)	Large (?)	Production of plutonium and radioisotopes.

A materials-testing reactor was also expected to be under construction at the Arco site early in 1950. Designed to operate at very high neutron flux density, the reactor will be used primarily to study the effect of neutron bombardment on materials that might be considered for use in constructing power-producing reactors of the future. Cost of the reactor was estimated at $25,000,000.

A third reactor to be built at Arco, Idaho, is a model of a type suitable for power generation for propulsion of ships, particularly naval vessels. It is anticipated that construction will be underway by 1952. The cost of the reactor is expected to amount to $25,000,000 or, perhaps, substantially more, depending upon difficulties encountered.

It was planned to begin assembling a fourth reactor during 1950 at West Milton, near Schenectady, N. Y. The unit would utilize neutrons in the intermediate energy range with the joint objectives of producing useful power and of breeding additional fissionable material. Heat energy would be removed with liquid metal. It was estimated that this reactor, the first to be designed to utilize intermediate-energy neutrons, would cost between $25,000,000 and $40,000,000.

Radiography.—The AEC in reporting on radioisotopes indicated that uses in medical research continued to be predominant over other fields.[3] Publications were issued outlining industrial and other uses.[4] Radium is used principally for treatment of tumors, as an energy source in luminous paints, and for industrial radiography.

Isotopes shipped by the U. S. Atomic Energy Commission, by uses, 1946–49, in number of shipments

Use	1946[1]	1947		1948		1949		Total		
	Radioactive	Radioactive	Stable	Radioactive	Stable	Radioactive	Stable	Radioactive	Stable	Grand total
Medical therapy	88	716		1,142		2,037		3,983		3,983

[1] Shipped by Manhattan District, Corps of Engineers, U. S. Army Service Forces. No stable isotopes shipped in 1946.
[2] Possibly included in "Other".

PRICES

Uranium Ore.—Early in 1949 the AEC issued a revised price schedule for the purchase of Colorado Plateau carnotite-roscoelite ores. Principal changes included a rise in the base price per pound of U_3O_8 contained in ores assaying 0.10–0.19 percent U_3O_8, payment of a development allowance on ores in the 0.10–0.14 percent U_3O_8 range, and incorporation of the old "facilities allowance" (see table

Consumption of uranium and thorium compounds for nonenergy purposes in the United States, 1945–49, in pounds of contained U_3O_8 and ThO_2

[U. S. Atomic Energy Commission]

Industry	1945	1946	1947	1948	1949
URANIUM (U_3O_8 EQUIVALENT)					
Chemical (including catalytic)	[1] 3,800	2,500	2,400	1,993	2,426
Ceramic (including glass)	150	1,000	825	385	270
Photographic	(1)	360		225	
Electrical	1,000	300	150	200	103
Total U_3O_8	4,950	4,160	3,375	2,803	2,799
THORIUM (ThO_2 EQUIVALENT)					
Gas-mantle manufacture	(2)	(2)	26,658	36,697	44,621
Refractories and polishing compounds	(2)	(2)	3,110	1,634	1,847
Chemical and medical	(2)	(2)	1,176	1,767	596
Electrical	(2)	(2)	1,283	427	237
Total ThO_2	(2)	(2)	32,227	40,525	47,301

[1] Photographic included with chemical.
[2] Figure not available.

in Minerals Yearbook, 1948, p. 1269) into the base price previously posted for ores containing 0.20 percent U_3O_8 or better.[5] The new schedule was to be in effect for the period February 1, 1949, through June 30, 1954.

Payment per pound of U_3O_8 under the revised price scale is stipulated as follows:

Percent U_3O_8	Price per pound U_3O_8	Percent U_3O_8	Price per pound U_3O_8
0.10	$0.50	0.16	$1.60
.11	.70	.17	1.70
.12	.90	.18	1.80
.13	1.10	.19	1.90
.14	1.30	.20	2.00
.15	1.50		

A minimum U_3O_8 content of 0.10 percent is specified. Premium payments will be made on uranium at 25 cents per pound U_3O_8 in excess of 4 pounds of contained U_3O_8 per short ton of ore and an additional premium of 25 cents per pound for each pound over 10 pounds per ton. A development allowance of 50 cents per pound contained U_3O_8 will be paid for ores assaying 0.10 percent U_3O_8 or more. Vanadium will be paid for at 31 cents per pound of contained V_2O_5, but payment will not be made for V_2O_5 present in excess of 10 pounds for each pound of contained U_3O_8, except at buyer's option through special written agreement with individual producers. Ores must not contain more than 3 parts lime ($CaCO_3$) to 1 part V_2O_5 and, in any case, lime must not exceed 6 percent; similarly, ores containing other undesirable impurities are unacceptable. A haulage allowance of 6 cents per ton-mile will be paid up to a maximum of 100 miles, for ore bought by the AEC and delivered to its purchasing depot.

Substantial tonnages of high-lime (over 6 percent $CaCO_3$) carnotite-roscoelite ore, unsalable under the aforementioned revised price

[5] U. S. Atomic Energy Commission, Guaranteed Minimum Price for Uranium-Bearing Carnotite-Type or Roscoelite-Type Ores of the Colorado Plateau Effective Feb. 1, 1949, through June 30, 1954: Domestic Uranium Program, Circ. 5, Feb. 7, 1949, 5 pp.

schedule, became marketable in July 1949 upon announcement by the AEC that special contracts would be drawn up for their purchase and delivery to the Monticello, Utah, plant. Terms of purchase will follow the pattern previously outlined for low-lime ore; but, because of the untoward effect of excessive lime upon vanadium recovery, appropriate deductions in price will be made to compensate. At the time the plan to purchase high-lime ores was announced, it was also reported that a suitable process for their treatment had been devised and would eventually be incorporated into the Monticello mill circuit as soon as enough ore had been accumulated to justify its installation.

The previously guaranteed minimum price of $3.50 per pound of U_3O_8 contained in ores other than the carnotite-roscoelite type[6] continued in effect during 1949. This price applies to ore assaying not less than 10 percent U_3O_8, 10 short tons minimum, f. o. b. designated shipping point. Higher prices may be paid by the AEC for guaranteed delivery of lots of ore or concentrates substantially exceeding 10 tons or under other conditions involving special refining, milling, and shipping costs.

Uranium.—During 1949 the AEC reported that 200 pounds of high-purity uranium metal would be made available for nonenergy use from the Mallinckrodt Chemical Co., St. Louis, Mo., at a price of about $50 per pound.

Radium.—A significant quantity of radium bromide was sold during 1949 at approximately $19 per milligram.

Isotopes.—In December 1949 the Isotopes Division of the AEC announced drastic reductions in the prices of certain fission-product isotopes when purchased in quantities exceeding 100 millicuries.[7]

Thorium.—Average prices in 1949 for thorium nitrate and oxide were reported by a large producer, respectively, as $2 per pound in 1,000-pound lots and $5 per pound in 10-pound lots. Electrically fused oxide was sold for $20 to $35 per pound, price varying with grain size and processing required. Thorium-metal powder in 1949, per gram, in lots of over 200 grams, was priced at 25 cents. (See Minor Nonmetals chapter, this volume, for monazite prices.)

FOREIGN TRADE[8]

The AEC announced that action had been taken in 1949 to assure a continuing supply of raw materials from other countries. A large proportion of the uranium used by the AEC is obtained from the Belgian Congo and Canada. Import and export data on uranium and thorium ores, concentrates, metal, alloys, and compounds are not disclosed. Total exports of radioisotopes reported by the AEC to the end of 1949 reached 700 shipments (20 in 1947, 335 in 1948, and 345 in 1949).

WORLD REVIEW

On September 23, 1949, President Truman announced publicly, "We have evidence that within recent weeks an atomic explosion occurred within the U. S. S. R." Subsequently, on October 24, during the cornerstone laying of the Secretariat Building of the permanent

1949	98.032	1,719,656	17,500	370	(2)	(2)	(2)

[1] Revised figure.
[2] Not separately classified.

United Nations headquarters in New York, the President reaffirmed the stand of the United States with respect to international control of atomic energy, stating,

> Ever since the first atomic weapon was developed, a major objective of United States policy has been a system of * * * control * * * that would assure effective prohibition of atomic weapons and at the same time would promote the peaceful use of atomic energy by all nations. * * * We support this plan (the Majority Plan for international control, approved by members of the Security Council excepting the U. S. S. R. and satellite countries) and will continue to support it unless or until a better and more effective plan is put forward.

In the latter part of 1949, representatives of the United States, Canada, and the United Kingdom met in London, England, to discuss problems relating to location, mining, and processing of radioactive ores and matters pertaining to reactor safeguards. Other discussions were held at Chalk River, Ontario, dealing with document declassification, radiation tolerance, and the design and performance of radiation detection and measuring instruments.

WESTERN HEMISPHERE

Brazil.—Extensive deposits of rich monazite sands occur along the beaches and inland from the coast of the States of Rio de Janeiro, Espirito Santo, and Baia. Monazite reserves of the principal deposits have been estimated at about 150,000 tons.[9] Exports of monazite concentrates from 1890–1949 have totaled almost 75,000 metric tons. The thorium content of Brazilian monazite averages about 6 percent ThO_2. Strong sentiment was rising that favored imposition of an embargo on monazite exports, with the twofold objective of conserving thorium resources for possible atomic energy use and of establishing a domestic rare-earth chemical industry.

Canada.—Essentially all Canadian uranium ore production has come from the mine of the Crown company, Eldorado Mining & Refining (1944), Ltd., at Great Bear Lake, N. W. T. The company

[9] Leonardos, Othon Henry, Devemos industrializar no Brasil os minerios de metais raros: Mineração e Metalurgia, vol. 14, No. 83, January–February 1950, pp. 137–138.

reported that underground exploratory diamond drilling and development footage at Great Bear Lake in 1949 amounted to 14,590 and 10,600 feet, respectively. Estimated ore reserves were said to be improved over the same period in 1948. Net profit for Eldorado Mining & Refining (1944), Ltd., was C$2,199,590 in 1949 compared to C$1,335,399 for 1948.

Extensive underground development work was done in 1949 on numerous properties showing commercial promise in the Goldfields area of Saskatchewan on the north shore of Lake Athabaska; the various deposits were described.[10] Exploration was active in 1949 at Contact Lake and in the Marian River-Hottah Lake regions, both south of Great Bear Lake; at Black Lake, 110 miles east of Goldfields; in British Columbia at the Victoria property near Hazelton and the Gem property in the Bridge River district; and in Ontario over an area bounded roughly by Sault Ste. Marie on the south, Agawa to the north, Lake Superior on the west, and the Mississagi River to the east. In the latter area exceptionally rich finds of pitchblende were found on the properties of Labine-McCarthy Uranium Mines, Ltd., and Ranwick Uranium Mines, Ltd., about 55 miles north of Sault Ste. Marie.

The Atomic Energy Control Board reported expenditures for the fiscal year 1948–49 (to March 31) on the Chalk River Project of C$6,476,714. The number of shipments of radioisotopes for the same period totaled 150. In a report dated Dec. 8, 1949, the Special Committee of the House of Commons on the Operations of the Atomic Energy Control Board recommended that an estimated C$40,000,000 be spent for a second heavy-water reactor, new housing and social facilities at Chalk River, Ontario, and research grants to Canadian universities.

The Government-guaranteed minimum price of $2.75 per pound of contained U_3O_8 in ore or concentrates, established in 1948, is for material containing a minimum of 10 percent U_3O_8, f. o. b. railhead, and is guaranteed for 5 years. Consideration is given to other values in the ore. In special circumstances higher prices may be paid or lower-grade ore purchased.

EUROPE

Germany.—The Soviet-owned Wismut A. G. controls all uranium (pitchblende) production from mines in the Erzgebirge region of eastern Germany. Work is said to be centered at Aue, Saxony.

U. S. S. R.—The development by the Soviets of an atomic bomb in 1949, as implied by the announcement of President Truman to the American people in September, indicated that a major industrial establishment devoted to nuclear energy had been realized in the U. S. S. R. Because of the drastic measures being employed by the Soviet authorities in developing the pitchblende veins of their zone of occupation in Germany and of the Jachymov region of Czechoslovakia, it is believed that these deposits may be their principal source of high-grade ore. Uranium may also be obtained by the U. S. S. R. from ores in Bulgaria and from the uraniferous black marine shales of Esthonia which extend into the Leningrad area of Russia. Mona-

[10] Christie, A. M., and Kesten, S. N., Pitchblende Occurrences of the Goldfields Area, Saskatchewan: Canadian Min. and Metal. Bull., vol. 42, No. 452, December 1949, pp. 643–650.

zite occurs widely in the Soviet Union, particularly in the alluvial gravels of Siberian rivers, such as the Yenisei.

D. B. Shimkin, Russian Research Center, Harvard University, reviewed Russian accounts of uranium ore deposits occurring within the confines of the Soviet Union [11] as follows:

> Russian research on radioactive minerals began in 1900–1903 * * * in the Fergana Valley (40° to 41° N., 70° to 73° E.) of Russian Central Asia. Beginning in 1909 the Imperial Academy of Sciences initiated more ambitious investigations. All previously gathered information was sifted carefully so that field work in 1911–1913 could be concentrated on the most promising localities: The Fergana Valley, Siberia, the Caucasus, Transcaucasus, and Urals. By 1914, indications from the Caucasus and Transcaucasus had become negative. In the Urals no indication of deposits of sufficient size for commercial exploitation could be found. Two areas appeared promising. One was Tyuya Muyun (40°21′ N., 72°0′ E.) in the Fergana Valley, with deposits of tyuyamunite, Ca $(UO_2)_2 \cdot V_2O_5 \cdot 6\ H_2O$, closely comparable to the carnotite of the American southwest. The other was the northwest slopes of the Khamar-Daban Range (51° to 52° N., 103° to 106° E.), especially near Slyudyanka (51°40′ N., 103°35′ E.) and the Trans-Siberian railroad between Baikal and Kultuk immediately across Lake Baikal, characterized by sites rich in mendelyeevite, with the probable composition, $2\ CaO \cdot 2(Ti, U)\ O_2 \cdot (Nb, Ta)_2O_5$ * * * .
>
> In 1914, a three-year program of research was authorized for the Academy of Sciences. The largest sums were to be devoted to expeditions in the Baikal area and the Fergana Valley, with lesser amounts going for investigations of the placer monazite deposits of the Transbaikal and for various minor projects. While World War I prevented full accomplishment of the program of the Academy of Sciences, enough was done to establish that only the Fergana Valley and the Baikal area had possibilities of commercial development. By 1918, the new Soviet Government began pressing for the resumption of laboratory and field investigations of radioactive minerals; on January 1, 1922, scattered radiological facilities in the USSR were combined in the Governmental Radium Institute of the Academy of Sciences * * *.
>
> This new institute concentrated its efforts on the site of Tyuya Muyun. An important reason for this decision was the fact that small-scale commercial operations had been begun there in 1908. Between 1908 and 1913 the Fergana Co. had mined 2,088,000 pounds of ore, 1,512,000 pounds of which had been sent to its plant in Leningrad for refining. * * * the ore contained, on the average, 2.36 percent V, 0.97 percent U_3O_8, and 3.73 percent Cu. Scientific study of Tyuya Muyun and the surrounding area * * * was pressed throughout the decade 1924–34 * * *.
>
> The Tyuya Muyun deposit is a vein field in * * * limestone * * * associated with extensive karst channels and caves. The vein field consists of at least five (1933) barite-ore veins bearing uranium, vanadium, and copper minerals and of over 30 pure barite veins. The productive veins are near the center of the deposit * * *. The barite veins extend up to 1,500 meters from the center; the maximum depth of the main vein may reach 500 meters.
>
> The ore bodies within the productive veins vary in thickness from 1.5 meters to a few centimeters, and correspondingly in length. Run-of-the-mine ore averages 1.5 percent U_3O_8, with a range of 0.6 to 4 percent, the higher values being found in the lower horizons. However, the uranium oxide content of the amorphous, brown, cupro-uranium carbonate lenses associated with the karst stalagmitic core runs from 26.12 to 50.25 percent. Also noteworthy are the uranium-free radiobarites—(Ba, Ra) SO_4—and radiocarbonates—$RaCO_3$—established in relatively high concentrations at both lower and upper horizons of the deposit. The irregularity of the Tyuya Muyun deposit has made impossible the estimation of reserves; the mine produced 534 metric tons of hand-sorted ore in 1925–26. By 1936, * * * the quantity of radium extracted from the Tyuya Muyun ores and from radioactive waters near Ukhta (approximately 63°35′ N., 53°40′ E.) was enough to meet the needs of the Soviet Union.
>
> Explorations in other parts of the Fergana Valley have also been undertaken In 1928, numerous indications of intense radioactivity were discovered in the western part of the Valley, but no uranium deposits. In 1923, * * * an account (was published) of the discovery of a uranium deposit at Uigar-sai or Atbash (41°2′ N., 71°12′ E.) on the northern side of the Fergana Valley. Geologically, the site was said to be closely similar to carnotite deposits in Colorado

[11] Shimkin, D. B., Uranium Deposits in the U. S. S. R.: Science, vol. 109, No. 2821, Jan. 21, 1949, pp 58–60.

and Utah. It is characterized by young, stream-deposited lenses of urano-vanadium ores, some of considerable size and richness. In terms of its high percentage of content, dimensions of individual ore bodies, and probable reserves the urano-vanadium deposit discovered at Uigar-sai does not yield to many carnotite sites in the U. S. A. The deposit is found under very favorable economic conditions, being situated at an automobile road; it is to undergo survey in 1939. * * * In the Tian Shan Range (are) other newly discovered deposits at Taboshar (40°37′ N., 69°39′ E.) and Maili su (41°18′ N., 72°27′ E.). In the first of these * * * uranium pitch (pitchblende (?)) is associated with bismuth glitter, wolframite, arsenopyrite, and sulfide polymetallic (lead, zinc) deposits. * * * the indicated uranium content of the ore is * * * of the order of 0.12–0.2 percent * * *. In the second site, infiltrations of urano-vanadium compounds are associated with tertiary limestones. Neither site was being commercially exploited in 1940.

In evaluating the significance of the Central Asiatic sites, it should be noted that, according to the Soviet prospecting plan for 1940, search for uranium and radium was to be concentrated in that area.

Two other recent finds of uranium-vanadium ores in Central Asia may be mentioned. In 1937, * * * an account (was published) of the deposit at Agalyk (39° 32′ N., 66° 52′ E.); * * * tyuyamunite was the most frequently occurring ore * * *. In 1940–41, the presence of uranium was established in a vanadium site in the northwestern tip of the Karatau Range (44° 30′ N., 67°30′E.). It represents a sedimentary deposit with subsequent metamorphism which has created a reiterated interbedding of thin bands of vanadium ores (with uranium-mineral accumulations) with flint bands. The total amount of uranium in the ore body (which extends for 25–30 km., with a thickness of 10–14 m.) is great; * * * the preliminary surveys of 1942 should be followed by more extensive explorations of the area.

In the area of the Khamar-Daban Range, serious investigations have been undertaken only at Slyudyanka, which is significant as a phlogopite mica deposit. * * * the presence of mendelyeevite (was) established * * * uranium oxide content in all samples ranged from 19.70 to 28.90 percent.

From an economic standpoint the results at Slyudyanka seem to be negative for mendelyeevite was found only in the pegmatite veins of two parts of the deposit, in which it appears generally to play a subordinate role. * * *

Despite the seemingly negative picture at Slyudyanka, the widespread development of formations, closely resembling the productive sector of this deposit, from the Sayan Range (approx. 50° N., 100° E.) northeastward to the Aldan gold fields (approx. 58° N., 125° E.) cannot be ignored. A genetic relationship may exist between niobium–tantalum–uranium ores and phlogopite mica; * * *. Thus the discovery of three major phlogopite-mica deposits in the Aldan gold field area * * * heightens the probability of corresponding finds to an unknown degree.

* * * Great importance (was attached) to further study of the Ukrainian magnetite-orthite pegmatites, particularly in the areas of Novograd Volynskii (50° 30′ N., 27° 40′ E.) and Berdyansk-Mariupol (46° 40′ N., 36° 50′ E.) to 47° N., 37° 30′ E.). * * * the likelihood of large, unexpected discoveries of Nb, Ta, U, Ti, and other minerals in these areas (was emphasized).

* * * Soviet discoveries of uranium in Central Asia within the last decade * * * appear to provide a possible basis for the development of atomic power in that area. * * * All of the Central Asiatic deposits are found within a radius of 250 miles from the important hydroelectric plants of the Tashkent area, which produced 882,000,000 kilowatt-hours of energy in 1943. Labor, transportation, and climatic conditions are also favorable here.

United Kingdom.—Construction of Britain's third nuclear reactor, on a site at Sellafield, Cumberland, was suspended in December 1949 by the Ministry of Supply following the October announcement of Prime Minister Atlee that Government departments were to cut expenditures. Plutonium was made for the first time in the United Kingdom, early in 1949, being created in "Gleep" (graphite low-energy experimental pile) the smaller of the two piles operating at Harwell, Berkshire.

Radioisotopes for medical and industrial use are being produced in both piles in considerable quantity; production from the larger reactor, "Bepo" (British experimental pile), began in February 1949.

Heat generated in "Bepo" reportedly is being used for space heating in the Harwell establishment.

On March 21, 1949, the Ministry of Supply announced it would purchase all uranium ores and concentrates of acceptable grade produced in British colonies during the subsequent ten years. A minimum price of 13s. 9d. was established per pound of contained U_3O_8, f. o. b. ocean port. The Ministry would not guarantee purchase of material assaying under 10 percent U_3O_8 or lots under 10 tons in weight. Prices above the minimum quoted might be paid in special cases where excessive costs would be a factor. Other terms would permit the Ministry to provide capital for installation of concentrating plants, if deemed advisable, and to finance mine development through grants-in-aid to any person producing and delivering, under the aforementioned terms, not less than 20 tons of ore or concentrate, 10 percent minimum U_3O_8, from a concession or mining lease not previously worked for uranium. No specific offer was made for thorium minerals but the Ministry stated it would discuss purchase terms with any prospective vendor.

AFRICA

Belgian Congo.—The Shinkolobwe mine of the Union Minière du Haut Katanga is the world's largest producer of high-grade uranium ore, and constitutes one of the main sources of uranium metal used by the United States. Uranium ores have been reported to occur in the Luiswishi copper-cobalt mine[12] of the Union Minière, about 15 kilometers north of Elizabethville.

Union of South Africa.—United States and United Kingdom representatives have been conducting informal discussions with the Union Government over a period of years on the problem of producing uranium from the gold ores of the Witwatersrand and its extensions.[13] Uranium is present as uraninite[14] and in radioactive carbonaceous matter,[15] and for years its presence has been known in osmiridium concentrates produced from the Rand. In 1948 it was reported that uranium had been found in almost every mine, and in the Orange Free State boreholes. The content of uranium, per ton, in the Rand ores is exceedingly small, but might possibly be recovered from some milling operations as a byproduct.

ASIA AND AUSTRALIA

Australia.—Crown ownership of minerals is vested in the Governments of the respective States, the Commonwealth Government exercising authority by virtue of its defense powers. The Commonwealth offers rewards up to £A25,000 for the discovery of uranium-ore deposits and will purchase uranium ores and concentrates containing not less than 5 percent U_3O_8.

Uranium ores of probable commercial importance occur in South Australia at Mount Painter about 300 miles north of Adelaide and 60 miles east of Copley, and at Radium Hill, near Olary, about 70 miles west of Broken Hill. An area of about 150 square miles in the Mount Painter locality has been under intensive geological study by the South Australian Government since June 1946, with diamond drilling and

underground development proceeding apace.[16] The deposit is reported to consist of primary uranium minerals disseminated in granite and pegmatite. Principal uranium minerals in ore mined so far have been torbernite and autunite, secondary minerals extensively developed in the near-surface oxidized zone. Ore at Mount Painter is much lower grade than that at Radium Hill, its eventual exploitation involving large-scale open-pit operations. The Radium Hill deposit, under exploration during the past 2 years, is reported to be of much greater significance than previously thought.[17] Ore minerals at Radium Hill are carnotite and davidite, a uraniferous ilmenite.

India.—The Government entered a 15-year agreement with two French firms, Banque Marocaine de Credit and Société de Produits Chimiques des Terres Rares, whereby the French companies would construct a monazite-processing plant in India.[18] Funds for construction are to be provided by the Government of India (55 percent) and the Government of Travancore (45). The plant will be operated by French-trained Indian personnel. The proposed annual capacity of the works would be 1,500 tons of monazite concentrates. Thorium nitrate and rare-earth compounds will be produced. Thorium content of Indian monazite averages about 9 percent ThO_2.

Vanadium

By Hubert W. Davis

GENERAL STATEMENT

FOR security reasons, publication of figures on production and consumption of vanadium ore in the United States since 1947 has been suspended.

DOMESTIC PRODUCTION

The center of domestic vanadium-ore mining in the United States is the Colorado-Utah region. Small outputs are made in Arizona, Nevada, and New Mexico, and vanadium-bearing phosphate rock is mined in Idaho.

Recovery of vanadium in vanadium-bearing phosphate ores is the subject of United States Patent 2,467,039, and a process for the treatment of vanadium-bearing iron ores is the subject of United States Patent 2,482,311.

Vanadium in ores and concentrates produced in the United States, 1938–47 [1]

Year	Vanadium, pounds	Year	Vanadium, pounds
1938	1,613,155	1943	5,586,492
1939	1,984,068	1944	3,527,054
1940	2,162,916	1945	2,963,913
1941	2,513,051	1946	1,272,148
1942	4,439,130	1947	2,117,962

[1] Data for 1940–47 are receipts at mills and Government purchasing depots.

USES

About 90 percent of the vanadium used is consumed as ferrovanadium in the manufacture of tool steels, engineering steels, high-strength structural steels, nonaging rimming steels, and special wear-resistant cast irons. Some ferrovanadium is used in welding-electrode coatings and as a deoxidizer,[1] and some metal is utilized in magnets. Some vanadium oxide is also used in the production of tool steel. The largest uses of vanadium oxide and ammonium metavanadate are as catalysts, in glass and ceramic glazes, for driers in paints and inks, and for laboratory research.

[1] Iron Age, Vanadium as a Deoxidizer: Vol. 164, No. 20, Nov. 17, 1949, pp. 97–102.

PRICES

For many years vanadium ore has been quoted at 27½ cents a pound of contained V_2O_5. This quotation, however, disregards the grade of the ore or the presence or absence of objectionable impurities—matters of importance to the refiners, inasmuch as impurities vitally affect recovery. Throughout 1949 vanadium pentoxide (technical grade) was quoted at $1.00 to $1.20 a pound of V_2O_5 and ferrovanadium at $2.90–$3.10 a pound of contained vanadium (depending upon the grade of the alloy).

FOREIGN TRADE[2]

Imports of vanadium concentrates (all from Peru) were 551,337 pounds (contained vanadium) in 1949, a decrease of 48 percent from 1948. There were no imports of flue dust containing vanadium or of ferrovanadium or vanadium oxide in 1949. Vanadium ore and concentrates enter the United States free of duty. However, the rate of duty on ferrovanadium is 12½ percent ad valorem and on vanadic oxide, anhydride, salts, and compounds and mixtures of vanadium 40 percent ad valorem.

Vanadium ore or concentrates and vanadium-bearing flue dust imported for consumption in the United States, 1940–49

Year	Vanadium ore or concentrates			Vanadium-bearing flue dust		
	Pounds		Value	Pounds		Value
	Gross weight	Vanadium content		Gross weight	Vanadium content	
1940	45,102,004	2,574,951	$1,216,705	(1)	(1)	(1)
1941	24,645,686	2,138,608	1,012,991	(1)	(1)	(1)
1942	36,492,268	2,422,376	1,274,483	624,423	154,028	$29,545
1943	22,117,131	2,052,620	1,080,150	748,749	64,393	53,553
1944	4,247,490	1,284,603	633,719	191,901	40,171	28,059
1945	8,776,328	1,550,479	725,362	133,795	26,293	19,378
1946	2,784,349	791,057	390,077	97,750	20,931	13,480
1947	3,274,548	983,869	448,076	143,124	71,819	15,483
1948	4,034,509	1,051,675	534,374			
1949	2,028,980	551,337	272,124			

[1] Not separately recorded.

Exports of vanadium ore and concentrates were 23,447 pounds (contained vanadium) valued at $26,266 in 1949, compared with 13,180 pounds valued at $32,263 in 1948. The 1949 exports comprised 10,091 pounds to Belgium, 9,436 pounds to Italy, 3,070 pounds to Austria, and 850 pounds to Canada. Exports of ferrovanadium were 194,655 pounds (gross weight) valued at $350,558 in 1949, compared with 238,824 pounds valued at $390,428 in 1948. The 1949 exports comprised 80,273 pounds to Canada, 69,193 pounds to Austria, 33,069 pounds to Italy, 8,960 pounds to Korea, and 3,160 pounds to Brazil.

[2] Figures on imports and exports compiled by M. B. Price and E. D. Page, of the Bureau of Mines, from records of the U. S. Department of Commerce.

WORLD REVIEW

World production of vanadium ores is limited almost entirely to four countries—Northern Rhodesia, Peru, South-West Africa, and the United States. From 1940 through 1947 output from these sources ranged from 1,400 to 4,400 metric tons, and from 1941 through 1947 the United States was the leading producer.

Vanadium has also been recovered commercially from phosphate rock, iron ore, chrome ore, magnetite beach sands, caustic-soda solution employed in Bayer process of refining bauxite, naphtha soot collected from the smokestacks of ships and industrial plants, and vanadiferous ashes derived from asphaltites.

Because complete information on the quantity of vanadium recovered as byproducts of iron ore and other raw materials is lacking, it is not possible to determine world production of vanadium from all sources. Consequently, the accompanying table reflects only the production of vanadium in ores and concentrates for the countries listed, plus the quantity recovered in the United States as a byproduct of phosphate rock.

World production of vanadium in ores and concentrates, 1940–49, in metric tons

[Compiled by Berenice B. Mitchell]

Country	1940	1941	1942	1943	1944	1945	1946	1947	1948	1949
Argentina	1	6	------	------	4	3	6	7	(1)	(1)
Mexico	32	(2)	------	------	------	------	------	------	------	------

[1] Figure not available.
[2] Less than 1 ton.
[3] Includes also vanadium recovered as a byproduct of phosphate-rock mining.
[4] Bureau of Mines not at liberty to publish figure.
[5] Total represents data only for countries shown in table and excludes vanadium in ores produced in French Morocco, Spain, and U. S. S. R., for which figures are not available; the total also excludes quantities of vanadium recovered as byproducts from other ores and raw materials.

Argentina.—Vanadium occurs in small deposits widely scattered in the Provinces of Córdoba and San Luis. A small quantity of ore is mined for the production of 3 to 5 metric tons of vanadium pentoxide annually.

China.—According to Foreign Commerce Weekly:[3]

> After 3 years of work, the Metallurgical Research Institute of the Enterprise Department of the North China People's Government has successfully concluded research in the extraction, refining, and utilization of vanadium-bearing magnetite-ilmenite. This important ore is produced in Tamiao and Heishan districts of Luanp'ing hsien, Jehol Province. Of outstanding importance was the discovery of a method whereby vanadium and magnetite-ilmenite could be extracted commercially from the ores. The vanadium-bearing magnetite-ilmenite in the Tamiao and Heishan districts is the only source of vanadium and magnetite-ilmenite yet discovered in China. * * *
>
> Preliminary estimates place the mine's deposit at about 2,000,000 tons, but some geologists have discovered outcroppings of similar ore in Miyun ad Tsunhua, considered to be an extension of the Luanp'ing mineral vein. The ore has strong magnetic qualities, and is steel-gray in color, estimated to contain 55 percent iron, 14 percent magnetite-ilmenite, and 0.3 percent vanadium.

[3] Foreign Commerce Weekly, Magnetite-Ilmenite Development in China: Vol. 37, No. 11, Dec. 12, 1949, p. 31.

Northern Rhodesia.—The Rhodesia Broken Hill Development Co., Ltd., was again the only producer of vanadium in Northern Rhodesia. Output of vanadium oxide was 293 long tons averaging 91.89 percent V_2O_5 in 1949 compared with 331 tons averaging 92.06 percent V_2O_5 in 1948. During 1949 the feed to the gravity concentrating plant was 21,348 short tons of material averaging 1.3 percent V_2O_5, which consisted largely of vanadium-bearing laterites and washing-plant fines. Leach-grade material produced at the gravity plant was 3,649 short tons containing 137 tons of V_2O_5, the recovery being 49.3 percent. Feed to the vanadium leach plant was 13,506 short tons of material assaying 3.06 percent V_2O_5, and the recovery was 72.2 percent and the acid factor 23.52 pounds of sulfuric acid per pound V_2O_5 in fused vanadium pentoxide produced.

Peru.—The famous Mina Ragra mine of the Vanadium Corp. of America in the Andes near Ricran, Department of Junin, has been an important source of vanadium since 1907, when production was begun. Output in Peru was 814 metric tons V_2O_5 in 1949 compared with 913 tons V_2O_5 in 1948.

South-West Africa.—The Abenab West lead-vanadium mine of the South-West Africa Co., Ltd., was the only producer of vanadium in South-West Africa in 1949. Output of ore and concentrates (V_2O_5 content) was 324 short tons in 1949 compared with 368 tons in 1948. Exports of ore and concentrates (V_2O_5 content) were 746 short tons, of which 264 tons went to France, 278 tons to the United Kingdom, and 204 tons to the Netherlands.

Zinc[1]

By Richard H. Mote and Esther B. Miller

GENERAL SUMMARY

DOMESTIC zinc smelters produced the largest quantity of slab zinc in the peacetime history of the industry in 1949. Output, up 2 percent over the 1948 level, totaled nearly 870,000 short tons, 68 percent of which came from domestic ores, 26 percent from foreign ores, and the remaining 6 percent from secondary sources. The use of foreign ores dropped from 1948, and production of slab zinc from this source fell 11 percent to the lowest level since 1941. Redistilled secondary slab-zinc production also declined in 1949. Output of slab zinc from domestic ores, however, increased 10 percent over 1948 and was the largest since 1943. Domestic mine output of recoverable zinc fell 6 percent from 1948 and, except for 1946 when extended labor strikes paralyzed the industry, was the smallest since 1939. Idaho continued to lead the States in zinc mine production. A 23,322-ton drop in imports of zinc in ores and concentrates was more than offset by a 33,693-ton gain in slab-zinc imports. The decline in imports of zinc ores and concentrates and the drop in domestic mine production reduced the current supply of raw materials available for smelting requiring a draft on smelters' stocks of zinc concentrates, which reduced them 92,000 tons or nearly 23 percent during the year. As the over-all supply of zinc metal exceeded consumers' needs during most of the year, producers' inventories pyramided to nearly 4½ times the quantity on hand at the beginning of the year. Consumers' stocks on December 31 were 16 percent under the January 1 inventory. The increasing availability of slab zinc was accompanied by a downward price readjustment from a high of 17.50 cents per pound to a low of 9 cents. At the end of the year one producer quoted the price at 10 cents, but most sales were at 9.75 cents.

DOMESTIC PRODUCTION

Statistics on zinc production are compiled both on a mine basis and on a smelter basis. The mine-output data, based upon the zinc content of ores and concentrates produced (adjusted to account for average smelting losses), are the most precise measure of zinc output from year to year. Smelter production of slab zinc presents a more accurate figure of actual zinc recovery but usually differs from the mine figure owing to overlap or lag between mine shipments and smelter receipts and treatment of ores and concentrates. Over a period of years, however, these variations tend to balance within the limits of statistical error.

[1] This report deals primarily with the smelter branch of the industry. Full details of zinc mining are given in the various State reports of this volume. As some zinc ore is used directly in the manufacture of zinc pigments, see also the chapter on Lead and Zinc Pigments and Zinc Salts.

Salient statistics of the zinc industry in the United States, 1940–44 (average) and 1945–49

MINE PRODUCTION

Zinc mining is centered largely in five areas—the Tri-State area of southeastern Kansas, southwestern Missouri, and northeastern Oklahoma; Tennessee-Virginia; Sussex County, N. J.; St. Lawrence County, N. Y.; and the Western States (principally Idaho, Arizona, Montana, Colorado, Utah, New Mexico, Nevada, and Washington, in descending order of productivity in 1949).

Mine production in the combined Western States declined 2 percent in 1949 as compared with 1948. Over 60 percent of the total domestic output of zinc in 1949 (58 percent in 1948) was produced in the Western States. Although the output of recoverable zinc in Idaho dropped 11 percent in 1949, the State continued to be the largest zinc-producing State in the United States. The Star mine near Burke in the Coeur d'Alene region remained the largest Idaho producer of zinc; it was followed by the Page, Morning, Sidney, Bunker Hill & Sullivan, Frisco, Amazon-Carlisle, Spokane-Idaho, Highland-Surprise, and Tamarack. These 10 properties, all in the Coeur d'Alene region, produced 80 percent of the State total. Over 97 percent of the State total zinc in 1949 came from the Coeur d'Alene region and most of the remainder from the Warm Springs district. Zinc-lead ore and old tailings concentrated yielded 93 percent of the State total zinc; old zinc slag smelted and fumed, 3 percent; and zinc ore and lead ore concentrated, 3 percent. Arizona zinc output in 1949 was far greater than in any year in the State's history. The Copper Queen mine at Bisbee, by far the largest zinc producer in the State in 1949, increased its output 28 percent over 1948. Other large producers of zinc were the Iron King mine at Humboldt, the San Xavier mine south of Tucson, the St. Anthony property at Tiger, the United Verde operations at Jerome, the Flux-January-Norton group near Patagonia, the Republic and Mammoth (Coronado Copper & Zinc Co.) properties

in Cochise County and the Old Dick mine in Yavapai County. More than 86 percent of the zinc production in 1949 was recovered from zinc-lead ore and most of the remainder from zinc-copper and zinc ore. With the exception of the Travona and Mike Horse mines, all the larger zinc producers in Montana reported declines in 1949. Decreases were particularly marked at Butte from June through September, following sharp breaks in the price of zinc. The leading zinc producers in 1949 were the Butte Hill mine and dumps (72 percent of the State total) and the Emma mine at Butte, the Mike Horse mine at Flesher, the East Helena old slag dump, an old slag dump in Cascade County, and the Travona mine, which together supplied 97 percent of the total. Of Montana zinc in 1949, 93 percent was derived from zinc-lead ore and old slag and nearly all the remainder from gold and silver ores and lead ore. Mine production of recoverable zinc in Colorado increased 6 percent over 1948 to reach the highest level since 1917. All the leading zinc producers that were active in 1948 except the Rico Argentine mine in Dolores County continued operations throughout 1949. The five leading zinc producers, in order of output, were: New Jersey Zinc Co. Eagle mine, Eagle County; American Smelting & Refining Co. Kokomo unit, Summit County; Idarado Mining Co. Treasury Tunnel–Black Bear group, San Miguel County; Resurrection Mining Co. Resurrection group, Lake County; and Telluride Mines (Inc.) Smuggler Union group, San Miguel County.

Utah zinc production declined 2 percent from the 1948 output. Production dropped sharply at the Tooele old-slag dump, New Park property, Silver King mine, and Pacific Bridge property. Increases were reported from the Butterfield group, Chief Consolidated property, Park Utah Consolidated property, and Hidden Treasure mine. Leading producers of the metal in 1949, in order of output, were the United States & Lark group properties of the Chief Consolidated Mining Co., Park Utah Consolidated Mines Co., New Park Mining Co., Butterfield group, Calumet mine, Tooele old-slag dump, Hidden Treasure mine, Pacific Bridge property, and Silver King Coalition mine. These 10 producers contributed 97 percent of the State total zinc. Mine production of recoverable zinc in New Mexico dropped 29 percent in 1949 and was the lowest since 1938. The nearly 49-percent decline in the price of zinc from March to June, with high production costs continuing, led to the closing by July 15 of all but one of the seven major zinc-producing mines and most of the small-scale operations. The output of recoverable zinc in the latter half of the year was only 5,749 tons compared with 23,597 tons in the first half. Large producers that suspended operations were the American Smelting & Refining Co. Ground Hog mine, the United States Smelting, Refining & Mining Co. Bayard group, the Kennecott Copper Corp. Oswaldo mine, the Peru Mining Co. Pewabic mine, the New Mexico Consolidated Mining Co. Kearney mine, all in the Central district, Grant County; and the Waldo mine of the American Smelting & Refining Co. at Magdalena, Socorro County. The first five of the foregoing mines were among the six leading producers of zinc in the State in 1949; the largest producer, the Empire Zinc Co. Hanover mine group in the Central district, operated throughout the year. Despite one of the severest winters on record and sharp declines in base-metal market prices, the Nevada mine output of recoverable

zinc in 1949 was slightly greater than the 1948 production. The Pioche district and adjacent Comet district, Lincoln County, together produced 92 percent of the State's zinc in 1949. The State's leading producers in the order named were: The Combined Metals Reduction Co. and Ely Valley Mines, Inc., both in the Pioche district; Copper Canyon Mining Co., Battle Mountain district, Lander County; and L. F. Jacobson (Yellow Pine Mine), Yellow Pine district, Clark County. In Washington the property of the Pend Oreille Mines & Metals Co. made a large increase in zinc output in 1949, but declines from the Holden, Deep Creek, and Grandview mines resulted in a net drop of 15 percent in the State total output compared with 1948. Leading zinc producers in 1949, in order of output, were the property of the Pend Oreille Mines & Metals Co. and the Holden, Grandview, and Deep Creek mines, which together contributed 96 percent of the total zinc. Zinc-lead ore supplied over 59 percent of the zinc in 1949, zinc-copper ore 25 percent, and zinc ore 15 percent. Mine production of zinc in California increased 35 percent over 1948. The Anaconda Copper Mining Co. continued to be the State's principal producer of zinc and lead. The company's Darwin and Shoshone mines were operated throughout the year except for a period from July through part of September when falling metal prices forced closure of the properties. Other important zinc mines operated in California during the year included the Penn mine in the Campo Seco district, Calaveras County; the Carbonate King Zinc mine in the Clark Mountain

Mine production of recoverable zinc in the United States, 1940–44 (average) and 1945–49, by States, in short tons

State	1940-44 (average)	1945	1946	1947	1948	1949

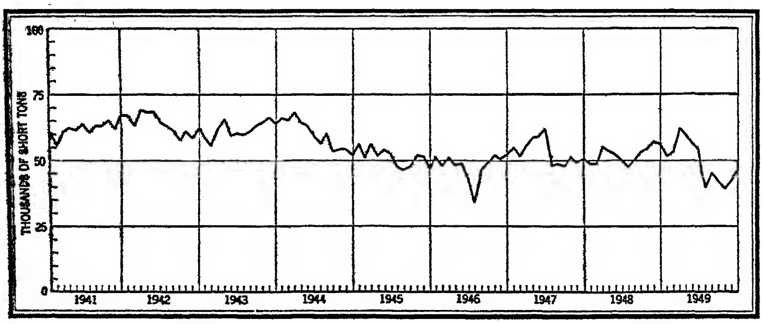

FIGURE 1.—Mine production of recoverable zinc in the United States, 1941–49, by months, in short tons.

Although mine output of zinc in Oklahoma increased slightly in 1949, production in Arkansas, Kansas, and Missouri continued to decline. Zinc production in the Tri-State district, decreasing for the eighth consecutive year, was 7 percent less than in 1948 and the lowest since 1896. In the first few months of 1949 concentrate prices were high enough to support the mining of low-grade ores, which constitute the bulk of the district reserves. Zinc output in March was the highest since June 1947. The sharp decline in the quoted price of zinc concentrates at Joplin—from $110 a ton for the week ended March 19 to a low of $50 June 18—disrupted virtually all operations, causing about 50 of the mines to shut down and most of the other 76 active mines to cut back output. The July production of zinc concentrates, reduced to an exceptionally low level by previous shut-downs and a work stoppage at the mines and mills of the Eagle-Picher Mining & Smelting Co., was only 3,529 tons compared with 18,256 tons in the peak month of March. From August through December the price received by the producers for zinc concentrates averaged $56.18 a ton, and the monthly production averaged 10,891 tons. The five leading zinc-producing companies in the district in 1949 were: Eagle-Picher Mining & Smelting Co., Nellie B. Mining Co., National Lead Co. St. Louis Smelting & Refining Division, Federal Mining & Smelting Co., and Sooner Milling Co.

Zinc production in States east of the Mississippi River decreased 12 percent from the 1948 output. Loss of production from New Jersey Zinc Co. mines in New Jersey, which were idle from September 27 through the end of the year because of a labor strike at the Palmerton (Pa.) zinc smelter, accounted for most of the decline.

In Kentucky and Southern Illinois the principal zinc producers were the Ozark-Mahoning Co. and the Minerva Oil Co. The slackening in demand for fluorspar from which zinc is produced as a byproduct in this district was the principal reason for a smaller zinc output in 1949 as compared with 1948. In New York the St. Joseph Lead Co. mines operated continuously throughout 1949. During the latter part of the year the Universal Exploration Co. curtailed production owing to the steel strike (October 1–November 12) which indirectly forced the closure of the Donora, Pa., zinc smelter.

In Tennessee the Tennessee Copper Co. made a small increase in zinc output. The American Zinc Co. of Tennessee suspended production at its Athletic mine June 17 but continued to operate the Grasselli, Jarnagin, and Mascot mines, except for a 3-week vacation period in July. Despite an inoperative period from October 7 to November 21, output from the Universal Exploration Co. mine near Jefferson City exceeded production in 1948.

In the Wisconsin-Northern Illinois district two new mines were opened. The Eagle-Picher Mining & Smelting Co. completed the Graham mill and began production from its properties a few miles north of Galena, Ill., and the Calumet & Hecla Consolidated Copper Co. built the Shullsburg mill and began operations at its properties in Wisconsin. The largest producer in the district was the Tri-State Zinc, Inc., which operated its Bautsch, Heer, and Black Jack mines. The Vinegar Hill Zinc Co., formerly the largest producer, closed its custom mill August 4.

The 25 leading zinc-producing mines in the United States in 1949, listed in the following table, yielded 60 percent of the total domestic zinc output; the 3 leading mines produced over 21 percent and the 6 leading mines nearly one-third.

Detailed information on the production of mines and districts in the United States may be found in the chapters of this volume dealing with the mine production of gold, silver, copper, lead, and zinc in the various States.

SMELTER PRODUCTION

During 1949, 19 primary zinc-reduction plants were in operation, of which 10 operated with horizontal retorts exclusively, 1 with both horizontal and vertical retorts, 3 with vertical retorts exclusively (1 electrothermic), and 5 with electrolytic methods.

Horizontal-Retort Plants.—The total number of retorts reported at active horizontal-retort primary plants in 1949 was 55,584, a 6-percent decrease from the 59,168 retorts on December 31, 1948, at plants that operated during that year. Of the total retorts reported, 51,652 (93 percent) were in use at the close of 1949, compared with 53,332 (90 percent) in operation at the end of 1948.

Vertical-Retort Plants.—Four vertical-retort continuous distilling plants operated during 1949. The St. Joseph Lead Co. operated its 13 electrothermic units at Josephtown, Pa., at about 87 percent of capacity throughout the year. Of the 66 vertical retorts at the remaining 3 plants, 63 were in operation on December 31, 1949.

Twenty-five leading zinc-producing mines in the United States in 1949, in order of output

Rank	Mine	District	State	Operator	Type of ore
1	Franklin & Sterling Hill	New Jersey	New Jersey	New Jersey Zinc Co.	Zinc.
2	Butte Hill mine and dumps	Summit Valley (Butte)	Montana	Anaconda Copper Mining Co.	Zinc-lead.
3	Copper Queen	Warren (Bisbee)	Arizona	Phelps Dodge Corp.	Do.
4	Balmat	St. Lawrence County	New York	St. Joseph Lead Co.	Do.
5	United States & Lark	West Mountain (Bingham)	Utah	U. S. Smelting, Refining & Mining Co.	Do.
6	Eagle	Red Cliff	Colorado	Empire Zinc Division, New Jersey Zinc Co.	Zinc.
7	Star	Hunter	Idaho	Sullivan Mining Co.	Zinc-lead.
8	Pioche	Pioche	Nevada	Combined Metals Reduction Co.	Do.
9	Austinville	Austinville	Virginia	New Jersey Zinc Co.	Do.
10	Mascot No. 2	Eastern Tennessee	Tennessee	American Zinc Co. of Tennessee	Zinc.
11	Page	Yreka	Idaho	Federal Mining & Smelting Co.	Zinc-lead.
12	Edwards	St. Lawrence County	New York	St. Joseph Lead Co.	Zinc.
13	Kokomo Unit	Ten Mile	Colorado	American Smelting & Refining Co.	Zinc-lead.
14	Iron King	Big Bug	Arizona	Shattuck Denn Mining Corp.	Do.
15	Hanover Mine group	Central	New Mexico	Empire Zinc Division, New Jersey Zinc Co.	Zinc.
16	Emma	Summit Valley (Butte)	Montana	Anaconda Copper Mining Co.	Zinc-lead.
17	San Xavier	Pima	Arizona	Eagle-Picher Mining & Smelting Co.	Do.
18	Walter Hartley	Tri-State	Kansas	St. Louis Smelting & Refining Co.	Zinc.
19	Bautsch	Northern Illinois	Illinois	Tri-State Zinc, Inc.	Zinc-lead.
20	Morning	Hunter	Idaho	Federal Mining & Smelting Co.	Do.
21	Davis-Bible group	Eastern Tennessee	Tennessee	Universal Exploration Co.	Zinc.
22	Chief, Gemini, etc.	Tintic	Utah	Chief Consolidated Mining Co.	Zinc-lead.
23	Grasselli	Eastern Tennessee	Tennessee	American Zinc Co. of Tennessee	Do.
24	Sidney	Yreka	Idaho	Sidney Mining Co.	Do.
25	Ground Hog group	Central	New Mexico	American Smelting & Refining Co.	Zinc.

Mine production of recoverable zinc in the United States, 1940–44 (average), by districts that produced 1,000 tons or more during any year, 1945–49, in short tons

District	State	1940–44 (average)	1945	1946	1947	1948	1949

[6] Bureau of Mines not at liberty to publish; not listed in order of output.

Electrolytic Plants.—Five electrolytic plants were in operation during 1949, as in 1948. There were 3,370 cells at the plants on December 31, 1949, of which 3,235 (96 percent) were in operation; the number of cells at the end of 1948 was 3,370, of which 3,310 (98 percent) were operating.

Smelting Capacity.—Irrespective of additions or subtractions of smelter recovery units, statistics on domestic smelting capacity vary from year to year owing to changes in metallurgical practices among the various plants. According to reports to the Bureau of Mines, the zinc-reduction plants in the United States on December 31, 1949, had a stated annual capacity to produce 1,035,179 tons of slab zinc under normal operating conditions, allowing for necessary shut-downs for repairs. This figure, which compares with a 1,010,933-ton reported capacity at the end of 1948, indicates that the 1949 output was 84 percent of the capacity. Horizontal- and vertical-retort plants operated at 82 percent of a stated 620,595-ton capacity (82 percent of a 610,697-ton capacity in 1948), electrolytic plants at 90 percent of a 362,500-ton capacity (91 percent of a 345,172-ton capacity in 1948), and secondary smelters at 62 percent of a 52,084-ton capacity (58 percent of a 55,064-ton capacity in 1948).

Waelz Kilns.—The following companies operated Waelz kilns in 1949:

Arkansas:
- Fort Smith—The Residue Co.

Illinois:
- Danville—The Hegeler Zinc Co.
- Fairmont City—American Zinc Co. of Illinois.
- La Salle—Matthiessen & Hegeler Zinc Co.

Kansas:
- Cherryvale—National Zinc Co., Inc.

Oklahoma:
- Henryetta—Eagle-Picher Mining & Smelting Co.

Pennsylvania:
- Donora—American Steel & Wire Co.
- Palmerton—New Jersey Zinc Co.

Slag-Fuming Plants.—The following companies operated slag-fuming plants in 1949 and produced impure zinc oxide, which was further treated for the recovery of slab zinc:

Idaho:
- **Bradley—Bunker Hill & Sullivan Mining & Concentrating Co.**

Montana:
- **East Helena—Anaconda Copper Mining Co.**

Texas:
- **El Paso—American Smelting & Refining Co.**

Utah:
- **Tooele—International Smelting & Refining Co.**

During 1949 these four plants treated 613,615 tons of hot and cold slag, which yielded 98,263 tons of oxide fume containing 65,854 tons of recoverable zinc. Corresponding figures for the four operating plants in 1948 were 510,581, 87,104, and 53,394 tons, respectively.

Active Zinc-Reduction Plants.—During 1949 a new block of furnaces was added at the National Zinc Co., Bartlesville, Okla., plant. The new unit, constructed during the first half of the year and put into operation in June, contains 832 retorts and is designed to handle 50 tons of sintered zinc material per 48-hour cycle. Improvement in metallurgical techniques at other horizontal retort plants was evidenced by progress in mechanical charging of retorts at the Amarillo, Tex., plant of the American Smelting & Refining Co. and the installation of a new rod mill at the Dumas, Tex., plant of the American Zinc Co. of Illinois. The new mill mixes retort charges immediately before charging into the retorts and is said to provide a heavier charge per retort.

A new type of condenser developed by the New Jersey Zinc Co. for use with vertical retorts in the continuous distillation of zinc was put into commercial operation during the year. This innovation in the field of metal vapor condensation employs a motor-driven graphite impeller within the condenser to generate showers of molten zinc for scrubbing or cleaning zinc metal from the gas-vapor stream of the retorts. Water-cooled coils within the zinc bath maintain the temperature of the molten metal at 500°.

A list of the zinc-reduction plants operating in the United States in 1949 follows:

Primary zinc distillers

Horizontal-retort plants

Arkansas:
- Fort Smith—Athletic Mining & Smelting Co.

Illinois:
- Fairmont City—American Zinc Co. of Illinois.
- La Salle—Matthiessen & Hegeler Zinc Co.

Oklahoma:
- Bartlesville—National Zinc Co., Inc.
- Blackwell—Blackwell Zinc Co.
- Henryetta—Eagle-Picher Mining & Smelting Co.

Pennsylvania:
- Donora—American Steel & Wire Co.
- Palmerton—The New Jersey Zinc Co. of Pennsylvania.

Texas:
- Amarillo—American Smelting & Refining Co.
- Dumas—American Zinc Co. of Illinois.

Vertical-retort plants

Illinois:
- Depue—The New Jersey Zinc Co.

Pennsylvania:
- Josephtown—St. Joseph Lead Co.
- Palmerton—The New Jersey Zinc Co. of Pennsylvania.

West Virginia:
- Meadowbrook—E. I. du Pont de Nemours & Co., Inc.

Electrolytic plants

Idaho:
- Kellogg—Sullivan Mining Co.

Illinois:
- Monsanto—American Zinc Co. of Illinois.

Montana:
- Anaconda—Anaconda Copper Mining Co.
- Great Falls—Anaconda Copper Mining Co.

Texas:
- Corpus Christi—American Smelting & Refining Co.

Secondary zinc distillers

Alabama:
- Fairfield—W. J. Bullock, Inc.

California:
- Los Angeles—American Smelting & Refining Co., Federated Metals Division.
- Torrance—Pacific Smelting Co.

Illinois:
- Beckemeyer—American Smelting & Refining Co., Federated Metals Division.
- Hillsboro—American Zinc, Lead & Smelting Co.
- Sandoval—Sandoval Zinc Co.

New Jersey:
- Trenton—American Smelting & Refining Co., Federated Metals Division.

Oklahoma:
    Sand Springs—American Smelting & Refining Co., Federated Metals Division.
Pennsylvania:
    Bristol—Superior Zinc Corp.
    Philadelphia—General Smelting Co.
West Virginia:
    Wheeling—Wheeling Steel Corp.

PRIMARY AND REDISTILLED SECONDARY SLAB ZINC

The output of primary slab zinc in 1949 advanced 3 percent over the 1948 production. Although the use of foreign concentrates declined and the slab zinc produced from this source fell 11 percent, output from domestic ore rose 10 percent to the highest level since 1943.

Production of redistilled slab zinc from zinc scrap dropped 12 percent from the 1948 record level. Of the 55,041 short tons of redistilled secondary slab zinc produced in 1949, 22,782 tons (41 percent) were derived from primary smelters, and 32,259 tons (59 percent) were produced at secondary plants. Data on output of remelted secondary slab zinc are not included with those for redistilled metal. In 1949 the production of slab zinc recovered by remelting purchased scrap was 6,045 tons (7,796 tons in 1948). Zinc rolling mills and other substantial consumers of slab zinc recover large quantities of zinc from their own plant scrap; but such metal is not measured statistically, for it seldom enters the market as scrap.

Primary and redistilled secondary slab zinc produced in the United States, 1940–44 (average) and 1945–49, in short tons

Year	Primary			Redistilled secondary	Total (excludes zinc recovered by remelting)
	Domestic	Foreign	Total		
1940–44 (average)	608,250	231,906	840,156	51,773	891,929
1945	467,084	[1] 297,477	764,561	49,242	813,803
1946	459,205	269,057	728,262	44,516	772,778
1947	510,058	292,437	802,495	59,542	862,037
1948	537,966	249,798	787,764	62,320	850,084
1949	591,454	223,328	814,782	55,041	869,823

[1] Includes a small tonnage of foreign slab zinc further refined into high-grade metal in the United States.

Labor strikes continued in 1949 to exact a toll on the smelter output of slab zinc. The horizontal retort smelter at Fairmont City, Ill., and the secondary plant at Hillsboro, Ill., strikebound since August 1948, remained closed until the latter part of September and the end of August 1949, respectively. The vertical retort smelter at Palmerton, Pa., was closed by strike on September 26 and continued idle throughout the balance of the year. Labor-management disputes at lead-producing operations in Idaho's Coeur d'Alene region forced curtailment in zinc output from one-third to one-half capacity at the electrolytic plant in Kellogg, Idaho. The horizontal retort plant at Donora, Pa., was closed from September 30 to November 11, and the coal strike brought about a 50-percent reduction in output at the Meadowbrook, W. Va., smelter.

DISTILLED AND ELECTROLYTIC ZINC

Of the 1949 output of primary zinc, 60 percent was distilled and 40 percent was produced electrolytically.

Production of Regular High Grade, Brass Special, and Prime Western rose 5, 23, and 12 percent, respectively, in 1949. Output of Special High Grade dropped 7 percent to the lowest level since 1945 and production of Intermediate grade fell off 45 percent to the lowest point since 1932. A decline of 46 percent was recorded in output of Selected grade. Of the total 1949 production (comparable 1948 figures in parentheses), 40 percent (37 percent) was Prime Western, 27 percent (29 percent) Special High Grade, 24 percent (23 percent) Regular High Grade, 6 percent (5 percent) Brass Special, 3 percent (5 percent) Intermediate, and less than 1 percent (1 percent) Selected.

Distilled and electrolytic zinc, primary and secondary, produced in the United States, 1945–49, in short tons

CLASSIFIED ACCORDING TO METHOD OF REDUCTION

Year	Electrolytic primary	Distilled	Redistilled secondary [1]		Total
			At primary smelters	At secondary smelters	
1945	269,924	494,637	21,205	28,037	813,803
1946	281,295	446,967	18,408	26,108	772,778
1947	295,520	506,975	22,093	37,449	862,037
1948	312,477	475,287	28,070	34,250	850,084
1949	326,152	488,630	22,782	32,259	869,823

CLASSIFIED ACCORDING TO GRADE

Year	Grade A		Grade B (Intermediate)	Grades C and D		Grade E (Prime Western)	Total
	Special High Grade (99.99% Zn)	Regular High Grade (Ordinary)		Brass Special	Selected		
1945	220,241	191,639	49,106	75,749	17,367	259,701	813,803

[1] For total production of secondary zinc see chapter on Secondary Metals—Nonferrous.

PRIMARY SLAB ZINC, BY STATES

Montana continued to be the leading producer of primary slab zinc in 1949; Oklahoma and Pennsylvania were in second and third places, respectively. Of the States for which production figures may be shown separately, Illinois, Idaho, and Arkansas occupied the next three positions. As usual, in Montana and Idaho slab zinc was produced by electrolytic methods only. In Illinois and Texas both electrolytic and distilled zinc metal was recovered, whereas in all other States zinc was recovered by distillation alone.

Primary slab zinc produced in the United States, by States where smelted, 1940–44 (average) and 1944–49, in short tons

Year	Arkansas	Idaho	Illinois	Montana	Oklahoma	Pennsylvania	Texas and West Virginia [1]	Total	
								Short tons	Value
1940–44 (average)	37,649	38,874	155,247	196,286	96,881	210,715	104,504	840,156	$135,034,000
1944	31,350	36,562	155,362	224,391	107,364	206,315	107,958	869,302	149,520,000
1945	29,391	33,110	124,904	179,251	106,115	200,709	91,081	764,561	131,504,492

[1] Includes Missouri, 1943–44 and 1947–49.

SECONDARY ZINC

In addition to the redistilled secondary slab zinc (unalloyed) already reported herein, some remelted slab zinc is produced, and a large quantity of secondary zinc is recovered each year in the form of alloys, zinc dust, zinc pigments, and zinc salts. Additional information on secondary zinc is given in the Secondary Metals—Nonferrous chapter of this volume.

BYPRODUCT SULFURIC ACID

Sulfuric acid made from the sulfur dioxide gases produced in roasting zinc blende (sphalerite) is an important byproduct of zinc smelting. To utilize a larger proportion of their acid-producing capacity, some plants also consume large quantities of native sulfur. The production of sulfuric acid at zinc-blende roasting plants decreased 20 percent in 1949.

Sulfuric acid (basis, 100 percent) made at zinc-blende roasting plants in the United States, 1945–49

Year	Made from zinc blende [1]		Made from native sulfur		Total [1]		
	Short tons	Value [2]	Short tons	Value [2]	Short tons	Value [2]	
						Total	Average per ton
1945	610,938	$7,944,478	235,594	$3,063,603	846,532	$11,008,081	$10.10
1946	544,529	6,842,541	160,886	2,021,696	705,415	8,864,237	9.76

[1] Includes acid from foreign blende.
[2] At average of sales of 60° B. acid.

ZINC DUST

Zinc-dust production in 1949 dropped to the lowest level since 1940. Zinc powder and blue powder are not included in the Bureau of Mines production totals; the zinc dust statistically reported is restricted to commercial grades that comply with severe specifications as to percentage of unoxidized metal, evenness of grading, and fineness of

particles. The zinc content of the dust produced in 1949 ranged from 94.97 to 99.70 percent and averaged 99.5 percent. Shipments of zinc dust, which totaled 22,715 tons—2 percent of which went to foreign countries—were slightly lower than production. The quantity consumed at manufacturers' plants (3 percent of output) was greater than the difference between production and shipments, with the result that producers' stocks decreased from 1,206 tons at the beginning to 600 tons at the close of the year.

The average price of zinc dust shipped to domestic consumers in 1949 was 13.56 cents a pound compared with 15.55 cents in 1948. The raw materials used to manufacture zinc dust are reviewed in the Secondary Metals—Nonferrous chapter of this volume. Most of the production is from zinc scrap (principally galvanizers' dross), but some is recovered from zinc ore, slab zinc, and as a byproduct of zinc refining.

Zinc dust [1] produced in the United States, 1940–44 (average) and 1944–49

Year	Short tons	Value		Year	Short tons	Value	
		Total	Average per pound			Total	Average per pound
1940–44 (average)	24,093	$4,698,765	$0.098	1947	30,602	$7,589,296	$0.124
1944	26,511	5,408,244	.102	1948	32,217	10,051,704	.156
1945	25,877	5,227,154	.101	1949	22,776	6,161,756	.136
1946	28,574	6,057,688	.106				

[1] All produced by distillation.

ZINC PIGMENTS AND SALTS

The principal zinc pigments are zinc oxide and lithopone, and the principal salts are the chloride and sulfate. These products are manufactured from various zinc-bearing materials, including ore, metal, scrap, and residues. Details of the production of zinc pigments and salts are given in the Lead and Zinc Pigments and Zinc Salts chapter of this volume.

CONSUMPTION AND USES

According to reports from 610 plants, 711,841 tons of slab zinc were put in process in 1949, a 13-percent drop from the 1948 total. Receipts at consumers' plants in 1949 were 696,732 tons. A comparison of the calculated figure of slab zinc available to consumers and the actual measured consumption since 1943 indicates that coverage of the plant survey was approximately 96 percent.

Galvanizing continued to be the largest field of zinc use in 1949, although the quantity consumed was less than the record peak consumption in 1948 owing to the labor strike which occurred within the steel industry during the latter part of 1949. Zinc-base alloys, largely die castings, continued to be the second-largest use of slab zinc; but, as in galvanizing, the quantity consumed in 1949 fell short of equaling the record high established in 1948. Consumption of slab zinc for the manufacture of brass products dropped sharply compared with 1948 as a result of the abnormally large return of brass scrap to the mills, which reduced requirements for primary metals. Rolled zinc required 28 percent less slab zinc in 1949 than in 1948.

Consumption of slab zinc in the United States, 1945–49, by industries, in short tons[1]

Industry and product	1945	1946	1947	1948	1949
Galvanizing:[2]					
Sheet and strip	135,383	113,816	115,147	120,360	146,923

Wet batteries	1,790	1,635	1,462	1,368	1,359
Desilverizing lead	2,095	1,781	2,687	2,654	2,448
Light-metal alloys	1,469	545	607	1,125	1,060
Other[3]	3,861	4,642	4,405	5,522	2,887
Total other uses	9,215	8,603	9,161	10,669	7,754
Total consumption[4]	852,311	801,242	786,360	817,735	711,841

[1] Excludes some small consumers.
[2] Includes zinc used in electrogalvanizing and electroplating, but excludes sherardizing.
[3] Includes zinc used in making zinc dust, bronze powder, alloys, chemicals, castings, and miscellaneous uses not elsewhere mentioned.
[4] Includes 5,111 tons of remelt zinc in 1945, 3,912 tons in 1946, 3,577 tons in 1947, 3,141 tons in 1948, and 2,394 tons in 1949.

The quantity of slab zinc consumed for rolled products in 1949 decreased 28 percent from the 1948 figure. In addition to slab zinc, the rolling mills remelt and reroll the metallic scrap produced from their fabricating operations. The scrap so treated in 1949 amounted to 8,977 tons—a sharp drop from the 15,032 tons processed in 1948. Purchased zinc scrap in the form of zinc clippings, old zinc scrap, and engravers' plates totaling 3,802 tons were melted and rolled in 1949 (3,689 tons in 1948). Production of rolled zinc from slab zinc and purchased scrap was 57,987 tons, a decrease of 25 percent from the 1948 total. Inventories of rolled zinc were 4,123 tons on December 31, 1949, compared with 4,120 tons on the same date in 1948. In addition to the actual shipments of 42,064 tons of rolled zinc in 1949, the rolling mills processed 24,648 tons of rolled zinc (including that which was remelted and rerolled) in manufacturing 16,205 tons of semifabricated and finished products.

The following table shows the six commercial grades of refined slab zinc and purchased remelt spelter consumed by the various industries in 1949. Of the 711,841 tons of domestic and foreign zinc consumed, 45 percent was Prime Western, 33 percent Special High Grade, and 14 percent Regular High Grade, compared with 40, 33, and 16 percent, respectively, in 1948. All grades of zinc were used for galvanizing and in the manufacture of brass. Prime Western was

Rolled zinc produced and quantity available for consumption in the United States, 1948–49

CONSUMPTION OF SLAB ZINC BY GEOGRAPHIC AREAS[3]

The geography of slab zinc consumption is available in detail only since 1940. During the 10-year period through 1949 substantial shifts are observable, largely the result of conversion to war production in 1940–41 and reconversion to peacetime consumption in 1945–46. The distribution of total slab zinc consumed for all uses according to geographic divisions and by States and for individual uses is shown in the following tables.

Consumption of Slab Zinc for All Uses.—During the period 1940–49 Illinois has ranked first among the 42 zinc-consuming States and the District of Columbia with an annual average of 132,280 short tons,

[3] This section is based partly on a detailed study by Ransome, Alfred L., Consumption of Slab Zinc in the United States by Industries, Grades, and Geographic Divisions, 1940–45: Bureau of Mines Inf. Circ. 7450, 1948, 30 pp.

[1] Revised figure.
[2] Nominal quantity consumed included with subtotal for division, as less than 3 companies reported.
[3] Excludes remelt zinc.

Since 1945 Ohio has been in second place. Connecticut, which averaged second during the war period owing to the large quantities of zinc consumed in the brass plants of that State, has since dropped to fifth place. Since 1940 Pennsylvania has held either second or third place. The greatest concentration of slab-zinc consumption is in the region comprising Illinois, Indiana, Michigan, Ohio, and Wisconsin. This area, which has consistently ranked first in zinc consumption since 1940, uses nearly half the total quantity of slab zinc consumed annually in the United States. The region of least consumption is the Mountain States, including Arizona, Colorado, Idaho, Nevada, New Mexico, and Utah, which has accounted for less than 0.3 percent of the total.

Consumption of Slab Zinc for Galvanizing.—The iron and steel industry is the largest consumer of slab zinc, which it uses for galvanizing or rustproofing sheets, wire, tubes and pipes, building and pole-line hardware, railway-signal equipment, chains, bolts, screws, and a multitude of other items. It is, therefore, quite understandable that the principal iron- and steel-producing States are also the principal consumers of zinc for galvanizing. From 1940 through 1943, Pennsylvania ranked first among the 34 States that consumed zinc for this purpose. In 1944 Ohio displaced Pennsylvania and re-

tained the top position in the succeeding years through 1949. The greatest concentration of zinc consumption for galvanizing is the region comprising Illinois, Indiana, Pennsylvania, and Ohio, which accounted for 62 percent of the average annual domestic consumption for this use in the period 1940–45. In 1946, total zinc used for galvanizing in these States rose to 65 percent but declined to 63 percent in 1947 and 1948 and 61 percent in 1949.

Consumption of Slab Zinc for Brass Products.—From 1940 through 1949 Connecticut has ranked first among the States consuming slab zinc for brass products; but, owing to the wartime demand for brass and the construction of new plant facilities, there has been some change in the rank of the other leading States. In 1940 Michigan was in second place, followed by New York, Illinois, Ohio, and Pennsylvania among the top six, whereas in 1949 Illinois ranked second, with Michigan in third place, followed by New York, Ohio, and Wisconsin.

Consumption of Slab Zinc for Zinc-Base Alloys.—The automobile industry is the largest user of zinc-base alloys, principally for die-cast parts and assemblies, such as fuel pumps, carburetors, radiator grilles, windshield wipers, and a wide variety of both interior and exterior hardware. Thus the region embracing Illinois, Indiana,

Michigan, Ohio, and Wisconsin, in which the automobile industry is centered, is the area of greatest concentration of slab zinc consumed for zinc-base alloys. Nearly 62 percent of the zinc used for die castings and other zinc-base alloys in 1949 was consumed in this region.

Consumption of slab zinc for zinc-base alloys in the United States, 1942–46 (average) and 1947–49, by States

Consumption of Slab Zinc for Rolled Zinc.—During the period 1940–49, although the quantity of slab zinc consumed for rolled zinc changed widely, the geographic pattern and rank of the consuming States varied but little. Illinois and Indiana ranked first and second, respectively, and accounted for the greater quantity of slab zinc consumed for rolling in the United States. Pennsylvania held third place through 1946 but was displaced in 1947 and 1948 by Iowa, which moved up from fourth position. In 1949 New York ranked third, with Iowa and Pennsylvania in fourth and fifth places, respectively.

STOCKS

Producers' Stocks.—Inventories of slab zinc at producers' plants were 94,221 tons on December 31, more than 4½ times larger than stocks on hand at the beginning of the year. The peak of the year was reached on October 31, when stocks totaled 97,666 tons.

Stocks of zinc at zinc-reduction plants in the United States at end of year, 1945–49, in short tons

	1945	1946	1947	1948	1949
At primary reduction plants	254,692	175,513	67,046	19,179	90,787
At secondary distilling plants	1,451	756	1,601	1,669	3,434
Total	256,143	176,269	68,647	20,848	94,221

Consumers' Stocks.—On December 31, 1949, consumers' stocks of slab zinc were 80,889 short tons, a decrease of 16 percent from the beginning of the year. At the average monthly rate of consumption in 1949, consumers' stocks on hand December 31 were approximately 1⅓ months' requirements.

Consumers' stocks of slab zinc at plants at the beginning and end of 1949, by industries, in short tons

Date	Galvanizers	Brass mills [1]	Die casters [2]	Zinc rolling mills	Oxide plants	Others	Total

[4] Stocks on Dec. 31, 1948 and 1949, exclude 312 (revised figure) and 198 tons, respectively, of remelt spelter.

PRICES

The market price for Prime Western grade slab zinc, St. Louis, was quoted at 17.50 cents per pound until March 23, when it dropped to 16 cents. A series of price reductions followed until June 15, when the quotation was 9 cents, where it remained for a month. On July 18 the price increased to 9.50 cents and 1 week later to 10 cents. The remainder of the year the quotation fluctuated from 9.25 to 9.75 cents. One producer quoted its price at 10 cents, but most sales were at 9.75 cents at the close of 1949.

The British Ministry of Supply price for foreign zinc per long ton delivered to consumers, duty paid, was £106 per long ton (equivalent to 19.05 cents a pound) at the beginning of the year. On April 4 it was reduced to £101 (18.15 cents), and on May 16, June 10, and July 12 further reductions to £85 (15.27 cents), £78 (14.02 cents), and £58 (10.42 cents), respectively, took place. It was raised on July 20 to £60 15s. (10.92 cents) and on July 26 to £63 10s. (11.41 cents), where it remained until September. Another rise on September 5 established the quotation at £66 5s. (11.90 cents). On September 10 the price dropped to £63 10s. (11.41 cents), where it remained until mid-September, when quotations were suspended. Due to the de-

[1] Does not include overquota premium payments made by Office of Metals Reserve in 1945–47.

valuation of the British pound on September 19, the quoted price as announced on September 21 was £87 10s. (equivalent to 10.94 cents a pound at the new $2.80 base). On October 8 a further reduction to £81 10s (10.19 cents) was announced, followed by three successive increases to £83 10s. (10.44 cents), £85 10s. (10.69 cents), and £87 10s. (10.94 cents) on October 28, November 3, and November 10, respectively. On November 23 the price was lowered to £85 10s. (10.69 cents), where it remained until December 30, when it was raised to £87 10s. (10.94 cents).

At the beginning of 1949 the Australian price per long ton, f. o. b., Risdon, Tasmania, for zinc for consumption was raised to £A40.

FOREIGN TRADE [3]

Imports.—Total imports of zinc in ores and concentrates in 1949 declined 9 percent from 1948. Of the 240,881 tons of contained zinc imported, 60 percent came from Mexico, 25 percent from Canada, 6 percent from Peru, 3 percent from Union of South Africa, 2 percent each from Australia and Spain, 1 percent from Bolivia, and the remaining 1 percent from Colombia, Costa Rica, Cuba, El Salvador, Honduras, Korea, and Saudi Arabia.

Slab-zinc imports totaled 126,925 tons and were 36 percent higher than the quantity imported in 1948. Canada supplied 86 percent of the total, Mexico 11 percent, and Belgium-Luxembourg 2 percent; Norway, Australia, Burma, Japan, and the Philippine Republic together accounted for the remaining 1 percent.

Zinc imported for consumption in the United States, 1945–49, by classes

[U. S. Department of Commerce]

Year	Ores (zinc content)		Blocks, pigs, slabs		Sheets		Old, dross, and skimmings [1]		Zinc dust		Total value [2]
	Short tons	Value	Short tons	Value	Short tons	Value	Short tons	Value	Short tons	Value	
1945	331,533	$15,021,771	96,760	$12,173,525	(3)	$2	7,299	$476,920	362	$39,789	$27,712,007
1946	166,885	8,122,471	[4] 104,065	[4] 16,481,904	(3)	10	[4] 4,087	[4] 293,375	77	4,942	24,902,702

[1] Includes dross and skimmings as follows—1945: 4,291 tons, $230,973; 1946: Revised figure, 2,801 tons, $181,918; 1947: 4,391 tons, $353,415; 1948: 8,637 tons $873,099; 1949: 2,668 tons, $335,283.

[2] In addition, manufactures of zinc imported as follows—1945: $8,077· 1946: $1,929; 1947: $4,429; 1948: $16,056; 1949: $2,583.

[3] Less than 1 ton.

[4] Revised figure.

Exports.—The value of exports of zinc ores, concentrates, and manufactured articles containing zinc of foreign and domestic origin (excluding galvanized products, alloys, and pigments) amounted to $23,159,259 in 1949, compared with $19,865,037 (revised figure) in 1948. In addition to the items shown in the accompanying tables, considerable zinc is exported each year in brass, pigments, chemicals, and galvanized iron and steel. Export data on zinc pigments and chemicals are given in the Lead and Zinc Pigments and Zinc Salts chapter of this volume.

[3] Figures on imports and exports compiled by M. B. Price and E. D. Page, of the Bureau of Mines, from records of the U. S. Department of Commerce.

Zinc imported into the United States, in ores, blocks, pigs, or slabs, by countries, 1947–49,[1] in short tons[2]

[1] Changes in Minerals Yearbook, 1948, p. 1307; 1946 data should read as follows: Ore—Bolivia, 28,442 tons; Mexico, 119,113 tons; Peru, 48,832 tons; total, 265,760 tons. Blocks, pigs, or slabs—Canada, 85,244 tons; total, 104,793 tons.
[2] Data include zinc imported for immediate consumption plus material entering country under bond.
[3] Revised figure.

Slab zinc was exported in 1949 to 32 foreign countries, representing shipments to every continent except Australia. United Kingdom was the destination of nearly 39 percent of the 58,709 short tons of slab zinc exported during the year. Over 21 percent was shipped to India, France received 8, and Germany and Netherlands received 7 percent each.

Zinc ore and manufactures of zinc, exported from the United States, 1945–49

[U. S. Department of Commerce]

Total (estimate) [1]	1,840,000	1,625,200	1,274,000	1,405,800	1,595,700	1,692,000	1,810,000

[1] In addition to the countries listed, Rumania and Yugoslavia produce zinc, but no estimates for them are included in the totals. Rumania produced about 2,300 metric tons in 1947, and Yugoslavia about 5,000 tons annually prewar.
[2] Data not available; estimate by senior author of chapter included in total.
[3] Data for Austria, Czechoslovakia, and Poland in 1943–44 included with Germany.
[4] Estimated.
[5] American and British zones only.
[6] Includes production from reclaimed scrap.
[7] Preliminary data for fiscal year ended March 31 of year following that stated.
[8] Fiscal year ended June 30 of year stated.

Minor Metals

By Jack W. Clark [1]

BERYLLIUM

THE commercial raw material of beryllium is the mineral beryl, generally found in granite pegmatite dikes associated with lithium, columbium, and tantalum minerals. Other possible future sources of beryllium are idocrase (vesuvianite), helvite, garnet, and associated minerals which occur in certain deposits formed where igneous rocks have intruded limestone. The rare-earth mineral, allanite, which is available in commercial quantities, is a possible source, sometimes containing up to a few percent BeO. Bauxite and kaolinite contain 0.005–0.01 percent BeO.

Mine Production.—Output of beryl in the United States in 1949 is believed to have reached a record high, a figure of 475 tons being reported by operators. The large production was not related to feldspar or lithium-mineral recovery, for in each case production of these commodities in the beryl-pegmatite areas either declined or remained essentially unchanged from 1948. Instead, the spectacular rise was accounted for by the fortuitous opening up of clusters of very large beryl crystals in New Hampshire, by growing awareness on the part of mining interests of the profit possibilities of beryl, and by record prices for beryl, spurred upward through a combination of National Stockpile purchases and Atomic Energy Commission interest superimposed upon normal commercial demands.

Arizona produced beryl in 1949, for the first time in Bureau of Mines records, from a locality 12 miles northeast of Morristown, Maricopa County; from a deposit near Crown King, Yavapai County; and from the Rare Metals mine, about 60 miles southeast of Kingman in the Aquarius Mountains. Reserves of beryl at the latter property were estimated at 150 tons. One buyer reported small purchases of beryl from California and Nevada. Colorado producers of importance in 1949 were the Devil's Hole pegmatite property, Fremont County, and the Willow Creek property operated by Beryllium Mining Co. northwest of Ohio City. A small production was reported from a locality 30 miles from Whitewater, Mesa County, presumably in the Uncompahgre Plateau granite. Beryl Ores Co., Arvada, Colo., purchases and beneficiates low-grade beryl ore to standard commercial specifications. Northern Mining Corp. produced beryl in 1949 from the Bumpus quarry, Albany, and the Black Mountain deposit in Maine. A spectacular beryl crystal was uncovered in the Bumpus quarry measuring 27 feet 7 inches long, with

[1] Figures on imports and exports compiled by M. B. Price and E. D. Page, of the Bureau of Mines, from records of the U. S. Department of Commerce.

end diameters of 39 inches and 11 inches. Ashley Mining Co., producing from the Palermo mine, Grafton County, and the Beryl Mountain mine, South Acworth, Sullivan County, N. H., was the largest individual producer of beryl in 1949. Whitehall Mining Co., at the Ruggles quarry, near Grafton, and the N–49 Chandler quarry, near Raymond, also reported production. Arthur Montgomery's Harding mine, near Dixon, N. Mex., contributed significant production in 1949; a report on the Harding mine was published by the Bureau of Mines.[2] Twenty-seven and one-half tons of beryl were produced from the Harding mine as of February 1946. A small 1949 production of beryl came from the McKinney mine and various unspecified feldspar-mica properties in the Spruce Pine district of North Carolina. In South Dakota production came from 15 to 20 properties in 1949; the Consolidated Feldspar Corp. and Black Hills Keystone Corp. were large producers. In addition to its output of commercial-grade beryl, the latter company reported production of 500 tons of 2-percent (BeO) ore requiring beneficiation. Two hundred pounds of chrysoberyl were produced and sold from the Scott Rose Quartz mine. Discovery of possible commercial quantities of beryl was reported in Washington at Earl Cannon's mine, 18 miles north of Chewelah.[3] A small load of beryl was reported shipped from the Shoshoni area in Wyoming.

Beryllium concentrates (beryl) shipped from mines in the United States, 1943–49, by States, in short tons

State	1943	1944	1945	1946	1947	1948	1949

[1] Included with "Other." Bureau of Mines not at liberty to show separately.
[2] Includes States indicated by footnote 1; in addition, 1943–44, North Carolina and Virginia; 1949, Arizona and North Carolina.

The Bureau of Mines and Geological Survey were both active throughout 1949 in pegmatite investigations in various States, conducting mapping, drilling operations, and reserve and mining studies. Reports of investigations of beryl deposits in Connecticut, Maine, and South Dakota were published by the Bureau.[4] A significant contribution to the literature of pegmatite geology was published by

the Geological Survey in 1949. Structural principles outlined in the study should be of considerable value in making future evaluations and in planning the mining development of pegmatite deposits.[5] Berylliferous pegmatites in Maine were described in other publications.[6] Five hundred and twenty tons of beryl reserves were inferred to a depth of 50 feet in the Red Hill pegmatites west of Rumford. Beryllium Development, Inc. (subsidiary of Beryllium Corp., Reading, Pa.), was organized to buy, sell, and mine beryl ore, with activities to be centered upon development of domestic ore supplies.

Refinery Production.—Beryllium Corp., Reading, Pa., and Brush Beryllium Co., Cleveland, Ohio, consume beryl for the production of beryllium metal, alloys, and compounds. Beryl Ores Co., Arvada, Colo., produced a small quantity of oxide in 1949 and planned to continue output in 1950. Clifton Products Co., Painesville, Ohio, a former large producer of fluorescent-grade oxide, was no longer active in commercial production, confining its efforts in the beryllium field to research.

In April 1949 the Atomic Energy Commission completed arrangements with the Federal Works Agency for use of a surplus wartime $5,000,000 magnesium-reduction plant at Luckey, Ohio, 15 miles south of Toledo. Construction of a new plant for beryllium production was completed on the site during the year, and the Brush Beryllium Co. engaged to operate the plant under contract. Operations were begun in November 1949, about 250 people being employed, according to reports.

The Champion Spark Plug Co., Detroit, Mich., and A. O. Smith Co., Milwaukee, Wis., consume beryl for ceramic purposes. Beryl Ores Co., Arvada, Colo., and the Foote Mineral Co., Philadelphia, Pa., grind and blend beryl for ceramic uses.

Consumption and Uses.—Beryl consumption in 1949 was 48 percent below a year earlier, principally because of slackening demand for beryllium-copper products.

The most important use of beryl is as a source of beryllium oxide needed for the production of beryllium-copper alloys. Master alloy, containing about 4 percent Be, from which other alloys are prepared, is made by the arc furnace fusion of a mixture of beryllium oxide, carbon, and copper powder. The beryllium-copper alloys are of great commercial and strategic significance, having no peer when shaped into parts that must simultaneously perform a mechanical function and conduct electric current at moderately elevated temperatures. The ease with which beryllium-copper may be formed and subsequently age-hardened is a factor of immeasurable importance in its utility; the rapidly quenched alloys are ductile (Brinell 100) and readily machinable or castable into complex shapes which then may be very substantially hardened (Brinell 350–400) and otherwise strengthened by the fabricator with a simple heat treatment. Both ductile and mill-hardened stock is available commercially, with the mill-hardened forms becoming increasingly important. Beryllium-

copper alloys used in commercial practice range in beryllium content from about 0.25 to 2.85 percent, according to properties desired. Cobalt or nickel are generally added to confer additional desirable properties, and their presence is essential in those alloys containing less than 1 percent beryllium if the same precipitation-hardening effect which is conferred by beryllium at higher percentages is to be realized. Uses of beryllium-copper and methods for its forming and fabrication have been comprehensively treated in recent publications.[7] Commonly used beryllium-copper alloy compositions and some of their fields of application are listed in the accompanying table.

Approximate compositions and uses of commercial beryllium-copper alloys

Fabricating method	Physical characteristics	Percentage composition: copper plus—	Use
Wrought	High strength	1.90–2.15 Be 0.25–0.35 Co or Ni	Springs, bellows, electrical contacts, aircraft engine parts, cams, bearings and resistance welding electrodes.
Do	do	1.60–1.80 Be 0.25–0.35 Co or Ni	
Do	High conductivity	0.45–0.60 Be 2.35–2.60 Co or Ni	Current-carrying springs, switch parts, and other components where good electrical and thermal conductivity are desired at moderately elevated temperatures.
Do	do	0.25–0.50 Be 1.40–1.70 Co or Ni 0.90–1.10 Ag	Spot, seam, flash and projection welding dies and electrodes.
Cast	High strength	2.00–2.25 Be 0.35–0.60 Co or Ni	Sand, investment and plaster mold casting. Bushings, cams, marine propellers, pump parts, bearings, gears, safety tools, valve parts.
Do	do	2.60–2.85 Be 0.35–0.65 Co or Ni	Special purpose alloy for plastics molds and other applications requiring maximum strength, hardness and wear resistance.
Do	High conductivity	0.55–0.70 Be 2.35–2.60 Co or Ni	High-conductivity casting alloy for switches, circuit breakers, switch gear, welding jaws, resistance welding dies, electrode holders and other current-carrying members where strength, conductivity, and resistance to wear at moderately elevated temperatures are important.

Beryllium oxide has an unusual combination of high refractoriness, high dielectric properties at both normal and elevated temperatures, and superior resistance to thermal shock; in thermal conductivity it lies midway between 18–8 stainless steel and zinc. In consequence, beryllia is of great importance in high-quality porcelain compositions used for aircraft spark plugs[8] and ultrahigh-frequency (radar) insulators.[9] Beryllium oxide is also employed for refractories and crucibles, and as a component in special glass,[10] dehydrogenation catalysts,[11] phosphors, and synthetic emeralds.

[11] Thacker, Carlisle M. (assigned to the Pure Oil Co.), Activated Alumina-Beryllium Oxide Catalyst: U. S. Patent 2,480,520, Aug. 30, 1949.

Until June 30, 1949, the principal use of beryllium oxide (aside from being a beryllium-copper raw material) was in the composition of beryllium-zinc silicate phosphors for fluorescent lamps; thereafter, lamp manufacturers, by mutual agreement, ceased its use for this purpose, substituting instead nontoxic calcium halophosphate.[12] A similar change-over was reported taking place in England.[13]

The zinc-base alloy, Zncube, containing 0.1 percent beryllium as an essential constituent, and 2 to 2.5 percent copper, shows much commercial promise. Developed by the General Electric Research Laboratory, and now undergoing fabrication tests by the Illinois Zinc Co., Chicago, Ill., Zncube is reported to be almost identical with cold-rolled 70–30 brass in strength properties; a cost advantage is claimed over the latter from the dual standpoints of lower price per pound and a volume-weight relationship favoring Zncube by some 15 percent. Corrosion resistance is markedly superior to that of any other commercial zinc alloy. Zncube would find use in fabrication of lamp and fuse sockets and bases and hardware and would generally replace brass and some bronzes.

Beryllium (1 to 2 percent) added to stainless steel confers strength-retention at red heat. The important surgical and dental alloy, Ticonium (Ni-Co-Cr-Mo), contains 1 to 6 percent Be. Beryllium-nickel is employed as diamond-drill-bit matrix metal and in precision castings demanding high strength, hardness, and toughness. Use of beryllium in magnesium and aluminum foundries is commonplace, traces of the element (0.005 percent) reducing the flammability of magnesium and 0.05 to 0.5 percent, promoting melt fluidity, and refining the grain of aluminum.

Beryllium metal, as such, has had only limited commercial application to date, being used mostly for X-ray tube windows and, combined with radium or polonium, as a neutron source. Beryllium has major importance in certain nuclear reactor designs because of its moderating effect upon fast neutrons emitted by the fission of U–235 and plutonium. Great advances have been made very recently in producing high-purity beryllium metal and in fabricating items of previously unheard-of size and intricacy.

Stocks.—Industry inventories of beryl at the 1949 year end were a little more than double those of 1948, providing a brightened raw material outlook for 1950. All beryl stocks remaining in the World War II stockpile of the Office of Metals Reserve were transferred late in 1949 to the Bureau of Federal Supply for inclusion in the National Stockpile.

Prices.—Nominal quotations for beryl as published in the E&MJ Metal and Mineral Markets for 1949 were as follows for domestic ore, f. o. b. mine, per unit BeO, 10–12 percent BeO: January 13, \$26–\$28; January 27, \$26–\$30; April 7, \$25–\$30; June 4, \$25–\$35; August 4, \$30–\$35; October 27, \$35 (Colorado), \$25–\$30 (North Carolina). For imported ore, c. i. f. United States ports: January 27, \$26–\$28; August 4, \$25–\$30; October 27, \$26–\$30. Beryllium-copper, 4 percent Be, \$24.50 per pound of contained Be, plus the price of copper at

[13] Ceramic Age, Beryllium Poisoning Hazards: Vol. 54, No. 2, August 1949, p. 95.

market. This price was the same during 1948. Prices of all other beryllium products such as metal. alloys, oxide, and other compounds showed almost no change from 1948.

Foreign Trade.—United States imports of beryl increased abruptly for the second successive year, reaching the highest level on record since 1943, when 4,840 tons were received. In 1949 domestic receipts from Brazil, the world's largest producer of beryl, reached an all-time high. The 107 tons received from Japan represented reshipment of old stocks originally purchased by the Japanese from Argentina or Brazil. Receipts from French Morocco were the first on record.

Exports of beryllium metal, alloys, and scrap from the United States in 1949 totaled 187,927 pounds, valued at $481,767. Principal recipient countries were the United Kingdom 128,386 pounds, Sweden 24,457, Canada 14,627, and Australia 7,129, the balance going to 8 other countries. Exports of ore and concentrates were 691 pounds, valued at $2,087, to Canada and Switzerland.

Nine metric tons of beryl were purchased by the Economic Cooperation Administration, using local currency counterpart funds, at a cost equivalent to $3,300.[14] $5,000 was authorized by ECA to Bizone Germany for procurement of beryllium alloys from the United States.[15]

Beryllium ore (beryl concentrates) imported for consumption in the United States, by countries, 1945–49, in short tons

[U. S. Department of Commerce]

[20] Kawecki, Henry C. (assigned to The Beryllium Corp.), Purification of Ammonium Beryllium Fluoride: U. S. Patent 2,490,633, Dec. 6, 1949.

A novel device was under development for concentration of beryl involving the use of an induced nuclear reaction.[21] The sorting process is based upon the emission of neutrons from beryllium minerals which have been exposed to gamma radiation from a van de Graaff generator. The reaction is specific for beryllium at certain gamma radiation energy levels; the signals given by neutrons when ore passes on a belt are changed to mechanical commands through amplifiers and other electrical equipment. Pieces of beryl weighing as little as 1 gram each were picked at the rate of 5 per second.

WORLD REVIEW

North America.—According to advice received by the Bureau of Mines from Government agencies concerned with mineral resources in the various Provinces of Canada, beryl deposits of potential commercial importance are at present known to exist only in Manitoba, Ontario, and the Northwest Territories. Beryl occurrences have been found also in British Columbia, Nova Scotia, and in numerous localities in Quebec. The Department of Natural Resources, St. Johns, reports that no beryl deposits having commercial possibilities have yet been discovered in Newfoundland or Labrador. No beryl has been reported from New Brunswick. Extensive areas favorable for the occurrence of pegmatite dikes and, hence, of beryl exist in the northern half of Saskatchewan and the northeastern corner of Alberta. The fact that, in general, appreciably greater rewards may be realized by a prospector from the discovery or development of precious metal, uranium, and base-metal deposits has been responsible in large part for the relatively little attention paid to Canadian pegmatite deposits, except in the more populous and accessible southern areas.

World production of beryllium concentrates (beryl), by countries,[1] 1940–49, in metric tons

[3] Data not available; estimates by author of chapter included in total after 1945.

[4] Less than 1 ton.

[5] Estimate.

[6] Exclusive of U. S. S. R. Production in other countries for which data are not available is believed to be negligible.

[21] Pannell, James H., and Freyberger, Wilfred L., The Beryl Picker: Massachusetts Inst. Technol. Mineral Eng. Lab. Topical Rept. MITG-224, Sept. 20, 1949, 18 pp.

Beryl occurs in many pegmatites in the Cat Lake-Winnipeg River area about 90 miles northeast of Winnipeg, Manitoba, near the Ontario boundary. Occurrences of possible commercial importance have been noted west and north of Rush Lake, west of Cat Lake, north and east of Bernic Lake, south of Shatford Lake, and west and southeast of Greer Lake which lies south of the Winnipeg River. White, green, and golden varieties are found.[22] Crystals of beryl up to 1 foot in diameter have been observed. Vigorous development in 1949 by Northern Chemicals Ltd., Winnipeg, of nearby dikes rich in lithium minerals indicates a favorable trend toward possible ultimate exploitation of the beryl-rich dikes. Northern Chemicals, Ltd., reported that the company was giving attention to the recovery of beryl. Late in 1949 a new 45-mile truck haulage road was nearly completed, linking the region in which the spodumene and beryl dikes occur with the railhead at Lac du Bonnet.[23] Winnipeg River Tin Mines, Ltd., with 25 claims north of Pointe du Bois on the Winnipeg River, reported that a large tonnage of beryl was available from its holdings provided suitable beneficiation methods could be developed, the beryl crystals being too small for hand cobbing.

In Ontario, beryl is found in Lyndoch township, Renfrew County. Work was begun on this property in 1926 when a few tons of beryl crystals were recovered. Subsequent work has been done by the present owners, Canadian Beryllium Mines & Alloys, Ltd., Toronto.[24] Crystals of beryl up to 6 to 8 inches in diameter and 3 feet or more in length have been found.

Pegmatites containing beryl, and believed to have commercial possibilities, occur over an extensive area north and east of Yellowknife on the northern shore of Great Slave Lake, Northwest Territory. Associated are columbite-tantalite, tin and lithium minerals, and mica. Beryl crystals about 1 foot in diameter are reported. Companies with holdings in the area are De Steffany Tantalum Beryllium Mines, Ltd., Edmonton, Alberta, and Tantalum Refining & Mining Corp. of America, Ltd., Toronto, Ontario.

Beryl of possible commercial importance is found in pegmatite in the Godthaab and Julianehaab districts in western Greenland and also along the eastern coast.

South America.—The States of Paraiba, Rio Grande do Norte, and Ceara in northeastern Brazil have been the source of the major portion of world beryl production. High-grade tantalite is recovered as an important coproduct, its salability having an important bearing upon beryl productivity at price levels that have prevailed to date. Commercial beryl deposits are also reported in Pernambuco, southern Bahia, and in the Doce River Basin of Minas Gerais.

Europe.—Beryllium metal was reported produced in 1947 in the laboratory of the Praz factory in Maurienne, *France*. Production was immediately expanded to the pilot-plant stage, the output late in 1949 amounting to several kilograms of 99.9 percent purity per day. The Calypso factory, destroyed during the war, is being rebuilt, and

[23] Northern Miner, vol. 35, No. 25, Sept. 15, 1949, p. 7

[24] Dominion Bureau of Statistics Department of Trade and Commerce, Miscellaneous Metals Industry 1948, p. 5.

beryllium will be produced there on an industrial scale. A factory at St. Jean de Maurienne makes beryllium copper.[25] Production of beryllium is prohibited in *Western Germany* by agreement among France, the United States, and the United Kingdom.[26] Production of beryl as a byproduct of feldspar and quartz mining in *Portugal* was unofficially reported at 15 to 20 metric tons in 1949. Exports were destined for France. The geological survey departments of the colonies were officially informed in 1949 that the *United Kingdom* wished to purchase all available supplies of beryl, principally for atomic energy use. Production was reported underway in several colonies, including Nigeria.[27]

Africa.—Beryl is known to occur in deposits of possible commercial importance in pegmatite in eastern *Belgian Congo* and in *Ruanda-Urundi.*[28] A beryl deposit of commercial note is reported in the Gedewa Mountains, southeast of Massawa, *Eritrea,* northeast of Ethiopia.

Mines des Zenaga in the Anti-Atlas Mountains of *French Morocco* began production of beryl in October 1948. In 1949, output was about 200 metric tons, averaging 12 percent BeO. Twenty tons were exported to the United States in 1949. Mining concessions of the company cover about 150 square kilometers. Production to date has come from a single dike, but some 15 dikes show beryl crystals on the surface. The company reported that production could probably be increased severalfold. Some of the beryl crystals are large, measuring 70 centimeters in diameter by 90 in length. Pegmatites containing beryl in commercial quantity are numerous in the central and southeasterly parts of the island of *Madagascar* especially in the province of Fianarantsoa. Crystals up to 3 meters long have been found at Manakana, northwest of Antalaha in the region of Tsaratanana. The approximate prices of Madagascan beryl concentrates, 12 percent BeO, were reported in August 1949 to be about 25,000 francs CFA (1 CFA franc equals 1 metropolitan French franc) per metric ton, f. o. b. mine, up to 35,000 francs, f. o. b. port.[29] All exports of beryl are reserved for France. Sale and transport of beryl are under authority of the Chef du Service des Mines, acting under authority conferred by the Comite de l'Energie Atomique. The Commissariat a l'Energie Atomique (France) has the prior right of purchase but may, and has, authorized purchase by private firms, such as Alais, Froges et Camargue. Exploration for and exploitation of beryl deposits in Madagascar is conducted by private companies and individuals. By a decree of April 5, 1946, the sale price of beryl must be determined anew each year in each territory of Madagascar by decision of the Chef du Territoire, under advice of the Chef du Service des Mines.[30]

Output of 25 tons of beryl came from the Fort Victoria district, *Southern Rhodesia*, in 1949.

[30] Lescop, René, Le Béryl à Madagascar: Echo des mines et de la métallurgie, No 3415, December 1949 p. 327.

Beryl pegmatites are numerous in an area exceeding 1,000 square miles in the northwest part of Cape Province *Union of South Africa* and southern part of *South-West Africa*, including portions of Namaqualand and Bushman Land, the Gordonia district of the Cape Province, and the Warmbad district of South-West Africa.[31] Under the stimulus of high prices beryl mining was resumed in 1948–49; total production for the region (exclusive of beryl produced as a by-product of lithium ores in the vicinity of Karabib, northeast of Walvis Bay, South-West Africa) to September 1949 was about 250 short tons, most of which was produced in 1949. The area in which the beryl occurs is a desert and is virtually uninhabited. A large percentage of current production comes from alluvial deposits near the dikes. Very large crystals have been found, measuring several feet in length and diameter. Beryl occurs in *Tanganyika* at Ufipa, in the Uluguru Mountains, in the Central Province northeast of Dodoma, and at Namaputa in the Lindi district.[32] Production of beryl in *Uganda* in 1948 reached 43.54 metric tons, all from Ankole. In addition, several tons of beryl were on hand at the Mbale Estate, Singo County, Mengo.[33]

Asia.—Rich deposits of beryl are reported to have been discovered in the Hsingan Mountains of *Manchuria* by the Manchurian Mining Co. during the Japanese occupation and plans made for their exploitation. The export embargo on beryl established by *India* in mid-1946 continued unrelaxed in 1949. The Government sought assistance in establishing a beryl-processing plant. Beryl productivity in India is potentially very large. Output has come principally from the United State of Rajasthan (formerly Rajputana) and also from Nellore, Madras State; Hazaribagh, Bihar State; and Kashmir. Beryl has been found in Rajasthan in crystals up to 20 feet long by 2 feet in diameter.[34] Santoku Ind. Co., Ltd., *Japan*, has a small beryllium oxide plant in Tokyo said to be capable of producing several hundred pounds of oxide per month. Beryl occurs at the Naegi mine (Gifu Province) and the Ishikawa mine (Fukushima Province). Santoku Kogyo Kaisha built a plant in Tokyo in 1939 to produce about 2,200 pounds of beryllium a year for alloying with copper. Small quantities of beryl are found in Ibaraki and Kyoto prefectures. Beryl occurs as a minor mineral in a tungsten-quartz vein at the Chongyang mine in Chungchong-Namdo, *South Korea*; a small amount was produced by the Japanese during World War II.

Russian publications (pre-World War II) referring to beryllium technology and ore deposits in the *U. S. S. R.* are numerous.[35] Work on beryllium technology in the Soviet Union was begun in 1922 by the Bureau of Rare Elements, being transferred to the Institute of Rare Elements in 1931. At the beginning of 1932, the first semi-industrial equipment was placed in operation for producing beryllium metal. Finally, in 1933 the New Metals Works began the electrolytic produc-

tion of beryllium. Beryl occurrences are numerous and widespread in the Soviet Union, localities ranging from the Chukotsk Peninsula facing Alaska in the east to the Armenian S. S. R. in the southwestern extremity adjoining Turkey and Iran. Known deposits of commercial importance, or potentially commercial, are few; however, of these, the famous Uralian emerald mines in the vicinity of Sverdlovsk on the east flank of the central Ural Mountains are the most important. The emerald pegmatite zone, in which commercial beryl also is found, varies from 100 to 600 meters in width and extends about 20 kilometers in length roughly paralleling the trend of the Urals. Exploration was conducted in 1933 at the important Malyshevski mine, results of which indicated the existence of large reserves of beryl; the investigation covered only a small part of the mineralized area. Probably second in commercial importance to the Ural area is the ancient Sherlova Gora mine east of Lake Baikal and about 250 kilometers east-southeast of Chita at a point near the common boundary point of eastern Siberia with Manchuria and Mongolia. Beryl is found in this locality in tungsten (ferberite)-quartz veins. Between Lake Baikal and the Yenisei River, north-northeast of Krasnoyarsk about 300 kilometers, lies the important Taseyevski mica mine in the Yuzhno-Uderei region; beryl crystals one-half meter long by 30 centimeters in diameter have been found here in pegmatite. In western Siberia large beryl crystals 1.5 meters long by over 25 centimeters in diameter occur in pegmatite at the Tigiretz deposit about 200 kilometers northeast of Semipalatinsk (Kazakh S. S. R.). Important occurrences of beryl exist in the Lake Balkhash region of eastern Kazakhstan, notably east of the railroad running north to Karaganda (tungsten veins), southeast of Ust Kamenogorsk (pegmatite), and about 300 kilometers northeast of Alma-Ata near the Sinkiang frontier. Other deposits of beryl pegmatites having commercial possibilities are known near Stalinabad, southeast of the city of Isfara, in the Tadzhik S. S. R.; associated economic minerals are tin and columbite. In addition to the localities listed, and regions adjacent to them, beryl deposits have been discovered in Pamir on the Afghanistan border, in the Caucasus Mountains of south Russia, in the Kzyl Kum region in the northwest of the Uzbek S. S. R., and in the Yakutsk S. S. R. in the region of the Lena and Andych Rivers, northeastern Siberia.

Australia.—Commercially noteworthy occurrences of beryl are found in every State in Australia, except Victoria, and production has been reported from all but the Northern Territory and Tasmania. Output for 1939–47, inclusive, has been reported as follows:[36] Queensland (Mount Isa), 12.85 long tons; New South Wales (Broken Hill district), 35.65 tons; South Australia (Olary district), 13.85; and Western Australia, 1,010.24. Of the Western Australian production, 710 long tons came from Wodgina, 70 miles south of Port Hedland, as a byproduct of tantalite mining. Wodgina beryl is rich in cesium, containing 0.72–0.92 percent Cs_2O. Beryl from Melville, near Geraldine, showed cesium and rubidium contents of 1.72 and 1.42 percent Cs_2O and Rb_2O, respectively. Productive deposits of beryl in Western Australia are scattered over an extensive area between

[36] Sullivan, C. J., and Ludbrook, N. H., Beryllium: Commonwealth of Australia, Dept. of Supply and Development, Bureau of Mineral Resources, Geology and Geophysics, Mineral Resources of Australia, Summary Rept. 18, 1948, 17 pp.

Port Hedland in the north to Balingup, south of Perth. Exportation of Australian beryl is prohibited, except for United Kingdom requirements. The United Kingdom Ministry of Supply purchases Australian beryl through its agent O. T. Lempriere & Co. Pty., Ltd. The price per long-ton unit, minimum BeO content 9.5 percent, bagged, f. o. b. main ports, was £A 5 until March 25, 1949, when the figure £A8, 2s. 6d. was posted.[37]

CALCIUM

Production.—Calcium metal is produced in the United States by the Electro Metallurgical Division, Union Carbide & Carbon Corp., Sault Ste. Marie, Mich., and the New England Lime Co., Canaan, Conn. Production of calcium metal in 1949 was about 20 percent below that in 1948; producers' shipments declined 34 percent. The Ethyl Corp. was reported to be considering production of calcium metal on a comparatively large scale as a byproduct of its sodium-metal operations at Baton Rouge, La.

Uses.—The metal is used principally in ferrous and nonferrous alloy production and as a basic raw material in the process for making calcium hydride.

Prices.—Calcium metal, in the form of slabs and small pieces was quoted in E & M J Metal and Mineral Markets in 1949 at $1.95 per pound, ton lots, until January 27, when an increase to $2.05 was noted, remaining unchanged thereafter.

Foreign Trade.—All domestic receipts of calcium metal originated in Canada and France, respectively.

Calcium metal and calcium-silicon imported for consumption in the United States, 1946–49

[U. S. Department of Commerce]

Commodity	1946		1947		1948		1949	
	Pounds	Value	Pounds	Value	Pounds	Value	Pounds	Value
Calcium metal			354	$675	796	$2,483	3,510	$4,736
Calcium-silicon	661,200	$87,647			429,488	52,378	112,000	14,977

Canada.—Annual output of calcium metal by Dominion Magnesium Ltd., Haley's Station, near Ottawa, Ontario, Canada, has been as follows: 1949, 556,521 pounds; 1948, 1,104,562; 1947, 723,461; 1946, 53,548; and 1945, 29,543.

CERIUM AND OTHER RARE-EARTH METALS

The mineral monazite has been by far the most important raw-material source of the rare earths to date. During 1949 lode deposits of rare-earth minerals of probable commercial importance, other than monazite, were made in the United States by prospectors engaged in searching for radioactive minerals. The rare-earth fluocarbonate, bastnaesite, was found widely distributed over an area of several square miles at a locality in southeastern California near Mountain

[37] Metal Bulletin (London), No. 3394, May 24, 1949, p. 15.

Pass Service Station, 53 miles southwest of Las Vegas, Nev., and 33 miles northeast of Baker, Calif. In the fall of 1949 rare-earth minerals of unknown mineralogic identity were found in large quantities about 9 miles north of Sundance, in the vicinity of Warren Peak in the Bear Lodge Mountains, northeastern Wyoming.

Production.—Lowered demand for ferrocerium alloy in 1949 caused a concomitant decline in output of both ferrocerium and the parent master alloy, misch metal. Producers of misch metal are Cerium Metals Corp., Niagara Falls, N. Y.; General Cerium Co., Edgewater, N. J.; and New Process Metals Co., Newark, N. J. Companies producing rare-earth magnesium alloys in 1949 were Dow Chemical Co., Bay City, Mich.; Howard Foundry Co., Chicago, Ill.; and American Light Alloys, Little Falls, N. J.

Consumption and Uses.—Misch metal is consumed principally in the production of the pyrophoric alloy, ferrocerium, which in turn is cast into thin rods and cut into short lengths for use as lighter flints. About 3,000 standard-size flints are obtainable per pound of ferrocerium. The use of misch metal is of strategic importance in the case of magnesium alloys required for high-temperature service, particularly in jet engines. About 3 percent misch metal is incorporated in such alloys,[38] along with 0.1–0.8 percent zirconium and, in some cases, 2–4 percent zinc. As a metallurgical additive in cast iron[39] and aluminum and copper alloys, misch metal is of growing significance.

Prices.—In 1949 misch metal averaged $4 per pound, unchanged from 1948; ferrocerium averaged $5.50 per pound, as compared to the 1948 figure of $8.

Foreign Trade.—220 pounds of misch metal and 4,436 pounds of cerium compounds, valued at $880 and $1,861, respectively, were imported in 1949. All receipts were from France.

Exports of ferrocerium and misch metal in 1949 totaled 70,009 pounds valued at $260,922 as compared to 55,133 pounds, valued at $323,582 in 1948. Recipient countries were Germany, 31,742 pounds; Portugal, 13,658; United Kingdom, 9,512; Canada, 5,205; Austria, 5,000; Belgium, 1,981; Sweden, 1,727; France, 964; Greece and Brazil, 220.

COLUMBIUM (NIOBIUM) AND TANTALUM

Mine Production.—Beryllium Mining Co., Inc., produced 1,020 pounds of columbium-tantalum minerals in 1949 at its Willow Creek property northwest of Ohio City, Colo. This material was not shipped.

Domestic Refineries.—Ferrocolumbium and ferrocolumbium-tantalum alloys are produced by the Electro Metallurgical Division, Union Carbide & Carbon Co., Niagara Falls, N. Y. Tantalum and columbium metal and compounds are made by Fansteel Metallurgical Corp., North Chicago, Ill. Tantalum and columbium metal in powder form and as the hydride compound are produced by Metal Hydrides, Inc., Beverly, Mass.

[38] Leontis, Thomas E., The Properties of Sand-Cast Magnesium-Rare-Earth Alloys: Jour. Metals, vol. 1, No. 12, December 1949, pp. 968–983.

Columbium and tantalum concentrates shipped from mines in the United States, 1940–44 (average) and 1945–49

Year	Columbium concentrates		Tantalum concentrates	
	Pounds	Value	Pounds	Value
1940–44 (average)	1,796	$476	3,413	$10,266
1945	1,149	287	5,500	13,366
1946			3,475	8,793
1947			3,259	8,677
1948	100	(1)	500	(1)
1949				

1 Bureau of Mines not at liberty to publish figure.

Uses.—Columbium finds its principal use as a carbide stabilizer in stainless steels and for imparting superior creep resistance and fatigue strength to alloys employed in jet-engine and gas-turbine construction. Columbium metal, as such, has found little application to date. Inadequacy of columbium ore supplies in the face of mounting demand for alloys containing columbium has provided the impetus for a vigorous program of research devoted to development of substitutes for columbium. Vanadium, titanium, and tantalum have shown promise. Low-carbon stainless steels have been recently developed which are reported to be suitable for many uses where the columbium-stabilized alloy had been formerly specified; in December 1949 Carnegie-Illinois Steel Corp. announced itself ready to begin commercial production of such steels.

Tantalum is most widely used in metal form, its properties of corrosion resistance (almost the same as glass), ease of fabrication, and high melting point making it especially useful in the chemical and electronics industries. Tantalum metal is extensively employed in surgical repairs; tantalum surgical products, such as sheet, foil, wire, gauze, ribbon, plates, and screws are distributed by Ethicon Suture Laboratories, Division of Johnson & Johnson, New Brunswick, N. J. Tantalum-tungsten alloy (92.5 percent Ta) is important in electronic tubes for spring components and is also suitable for springs and clips in plating and electropolishing baths. Tantalum carbide is used in Tantung, a cutting-tool alloy (cobalt-chromium-tungsten), and in cemented-carbide tools, wire-drawing dies, and special shapes. Cemented carbides containing tantalum (and columbium) are made by the Vascoloy-Ramet Division of Fansteel Metallurgical Corp. Cast alloys sold under the trade names of Tantaloy and Fanweld also contain tantalum carbide. Tantalum-metal electrodes are said to be superior for the electrochemical production of nitrogen oxide.[40]

Tantalum compounds are used as catalysts and optical glass components. Tantalum oxide, free of silica, fluorides, and all saline impurities and containing a small amount of iron oxide, is said to be an excellent wound dressing.[41] The tantalum electrolytic condenser was an important development in 1949 and is now available commercially. The Balkite rectifier and current-surge arrester each contain tantalum as an essential component in their construction.

40 Cotton, W. J. (assigned to Koppers Co., Inc.), Method of Electrochemically Producing Nitrogen Oxide in the Presence of Tantalum Electrodes: U. S. Patent 2,485,478, Oct. 18, 1949.
41 Olsen, Carl T. and Hoffman, Roger W. (assigned to Fansteel Metallurgical Corp.), Tantalum Oxide Composition: U. S. Patent 2,491,416, Dec. 13, 1949

Prices.—Metal Bulletin (London) quotations on columbite, 50–55 percent combined oxides (Cb_2O_5 plus Ta_2O_5), per unit c. i. f., opened the year at 70s.–75s.; successive increases were recorded as follows: February 18, 1949, 72s.6d.–77s.6d.; July 26, 77s.6d.–82s.6d.; November 4, 100s.–105s.; and November 25, 110s.–115s.; no further change was recorded thereafter to the end of 1949. E&MJ Metal and Mineral Markets quoted tantalum ore, 60 percent minimum Ta_2O_5, at $2–$2.75 per pound Ta_2O_5 until May 26, 1949, when a small decline was registered at $2–$2.50, from which level there was no change thereafter. Prices of columbium and tantalum metal in rod, sheet, and powder form were unchanged from 1948. Ferrocolumbium was quoted throughout 1949 at $2.90 per pound of Cb contained; this price was established on December 23, 1948.

Stocks.—No data are available on stocks of columbium or tantalum in any form. Columbite and tantalite are among the commodities acquired for the National Stockpile.

Foreign Trade.—Receipts of columbite from Nigeria, the most important producing country, declined sharply in 1949 for the second successive year and sank to the lowest level since 1940. As Nigerian columbite accounts for the major share of United States imports of this commodity, the total receipts from all countries showed a closely concomitant decline, falling to the lowest point since 1941. Columbium alloys were imported from Norway in 1949; a total of 103,638 pounds was received, valued at $102,215. Total tantalite imports in 1949 exceeded the abnormally low year 1948 by only a scant 7 percent and, with the exception of 1948, were the lowest since 1939.

Exports of columbium ore and concentrates in 1949 were 11,200 pounds, valued at $8,400, to Sweden, and 6,834 pounds, valued at $3,596, to Germany. Tantalum ore and concentrates, totaling 3,222 pounds, valued at $3,450, went to Sweden. Exports of columbium and tantalum metal and alloys were 90 and 3,483 pounds, valued at $460 and $92,082, respectively. Most of the tantalum metal and alloys went to the Union of South Africa, Australia, Germany, and France.

Columbium and tantalum ores (columbite and tantalite concentrates) imported for consumption in the United States, 1947–49, by countries, in pounds

[1] Revised figure.

WORLD REVIEW

Belgian Congo.—Production comes from Kivu Province and the adjoining Trusteeship area of Ruanda-Urundi, the columbite and tantalite being a coproduct of tin mining. Substantial reserves of columbite-tantalite are indicated.

Brazil.—The pegmatite deposits of the northeastern States of Paraiba and Rio Grande do Norte have furnished most of the world supply of high-grade tantalite, where the mineral is produced as a coproduct in the mining of beryl. Near-record demand for beryl, in contrast to consumer disinterest in tantalite, continued to cause the accumulation of large unsold stocks of the latter mineral.

Canada.—Peg Tantalum Mines, Ltd., was absorbed into Tantalum Refining & Mining Corp. of America, Ltd., in 1948. The latter organization carried out further development work on its tantalite holdings at Ross Lake northeast of Yellowknife, Northwest Territory, during 1949.

Nigeria.—Almost all of the world production of high-grade columbite has come from the tin placers of northern Nigeria. Exhaustion of the richer tin gravels has brought about a significant decline in output of columbite, which is recovered as a byproduct. Producers indicated that appreciably higher prices for columbite and/or tin concentrates might have to be realized to permit profitable working of lower-grade gravels.

Norway.—Columbite and koppite (calcium columbate) are found disseminated in limestone about 65 miles southwest of Oslo, on the southwest shore of Lake Nordsjø, near Ulefoss, Telemark County. The phosphate mineral, apatite, makes up about 6–10 percent of the limestone. Average columbium content of the ore is 0.2–0.3 percent. During the German occupation of Norway in World War II, I. G. Farbenindustrie conducted a program of diamond drilling and beneficiation research with the object of ultimately producing agricultural limestone, phosphate minerals, and columbium concentrates. A large reserve of columbium minerals was indicated. Similar deposits occur near Freiberg, Germany, and in the Sukula limestone of Uganda. There seems a strong likelihood that such deposits may have been overlooked elsewhere.

Southern Rhodesia.—Tantalite and the aluminum tantalate mineral, simpsonite, occur with tin minerals in the Bikita district east of Salisbury. In the fall of 1949, production of simpsonite was reported proceeding at the rate of 0.5–0.75 ton per month.

U. S. S. R.—Although columbium and tantalum minerals undoubtedly occur in many widely scattered pegmatite deposits, the apatite mines of the Kola Peninsula north of the White Sea probably are the greatest potential source. In this region, large quantities of complex minerals, such as loparite, a titanocolumbate, are known to occur in association with apatite deposits, which are being exploited on a very large scale.

United Kingdom.—Tantalum and columbium products are made by Blackwell's Metallurgical Works, Ltd., Liverpool, and Murex, Ltd., Rainham, Essex.

GALLIUM

Few elements exhibit so many spectacular physical properties as gallium, a silvery white metal about as heavy as iron. Having a melting point of only 29.75° C., a small piece of the solid metal held in the hand may be readily rendered molten through assimilation of body heat. In sharp contrast, the boiling point of gallium is remarkably high, being in the neighborhood of 2,000° C. Gallium metal is easily supercooled to temperatures substantially below its freezing point. Like water, gallium expands markedly upon freezing, and the resultant solid is less dense than the liquid metal. Because of its tendency to wet glass, in addition to its expansion upon freezing at near-room temperature, gallium metal is packaged commercially in cellophane bags and gelatine capsules which, in turn, are placed in rigid-type containers for added protection. Unlike mercury, liquid gallium has low vapor pressure over a wide range of temperatures and is nontoxic. Large orthorhombic crystals of gallium metal are readily grown and display startling differences in electrical resistivity and thermal expansion along the direction of their three crystallographic axes;[42] the ratios for electrical resistance and for the coefficients of thermal expansion were observed to be 1:3.2:7 and 31:16:11, respectively. The variation in resistivity is said to be greater than that known for any other metal. Crystals of gallium may be made to grow in any desired direction, according to the shape in which the original crystal is allowed to form. Long bars, which are actually single crystals, may be easily produced by crystallizing the metal in rubber tubes.

Production.—Rocky Mountain Research, Inc., Denver, Colo., was the only company reporting any gallium output for 1949; however, the metal or its compounds were probably also produced by the Donora Zinc Works of the American Steel & Wire Co., subsidiary of U. S. Steel Corp., Donora, Pa.[43] and by Saratoga Laboratories, Inc., Saratoga Springs, N. Y. In previous years gallium metal has been recovered by Aluminum Ore Co. (1946–48), subsidiary of Aluminum Co. of America, E. St. Louis, Mo.; Anaconda Copper Mining Co. (1943–45), Great Falls, Mont.; and Eagle-Picher Lead Co. (1946–48), Joplin, Mo. Demand for gallium in 1949 was negligible.

Most of the gallium produced domestically is derived in the process of extracting alumina from bauxite and from the smelting of zinc ores of the Tri-State district of Missouri, Kansas, and Oklahoma. Bauxite is reported to contain 0.002–0.008 percent Ga, and sphalerite in the Tri-State ores has been shown to assay from about 0.01–0.1 percent Ga, the lower figure being the general rule. Contrary to a widespread misconception, most of the gallium present in bauxite does not remain in the red-mud tailings, but, rather, is extracted along with the alumina from which it is separated on a batch basis, as demand may dictate. Ordinarily, however, no attempt is made to remove the gallium, the element ultimately ending in the final products, such as alumina or

[42] Powell, R. W., Some Anisotropic Properties of Gallium: Nature, vol. 164, No. 4160, July 23, 1949, pp. 153–154.

[43] Smith, G. T., and Moyer, R. C., Cadmium Recovery Practice at the Donora Zinc Works: Jour. Metals, vol. 1, No. 6, June 1949, pp. 360–363.

aluminum. The latter may contain about 0.01–0.02 percent Ga, which is not deleterious, however. The total gallium content of bauxite ore processed in the United States to make alumina, assuming a consumption of 2,000,000 short tons per year, would approximate 40 to 160 tons. In the absence of a low-cost continuous process for its routine recovery and, equally important, of large-scale demand for the metal, essentially all of this gallium will continue to be lost irretrievably. In the case of commercial recovery from the Tri-State zinc ores, gallium is removed, in part, by a preliminary chloridizing roast of the zinc sulfide concentrates, eventually finding its way to the cadmium-recovery plant, where it is finally extracted. (See the Germanium section of this chapter.) Where a chloridizing roast is not used on galliferous zinc ores which are smelted by the retort process, most of the gallium remains behind in the retort residues because of the element's relatively low volatility at the temperatures required for zinc distillation. Similarly, in the Waelz process for recovering zinc from retort residues, the gallium lags behind and is found in the slag, which may contain 0.01–0.05 percent Ga.

During 1949 the Bureau of Mines continued its search for domestic sources of gallium and studied means for its recovery from various raw materials, including gallium-rich residues formed in gas and coking plants.

Gallium is present in tin ores processed by the Government-owned tin smelter at Texas City, Tex., passing into the waste acid liquors and eventually into the "cements" discharged from the acid-reclamation plant.

Uses.—Aside from its familiar but very limited application in high-temperature thermometry, no uses have been developed for gallium yet that would require the element in any commercially significant quantity. The flurry of interest in gallium as a possible liquid-metal coolant in nuclear energy apparatus subsided almost completely as it became more generally known that excessive cost of the metal and unresolved technological difficulties probably obviated its use for this purpose. A gallium-nickel-silicon alloy was reported to show promise for dental fillings. The use of a radioisotope of gallium, Ga–72, for possible treatment of bone cancer was described. The element is injected in the form of gallium lactate, the radiogallium being concentrated selectively in the diseased portions of the bone, which are then bathed by its therapeutic rays.[44] Promising fields for gallium appear to lie in the electronics, phosphor, and fusible alloy industries.

Prices.—Gallium-metal quotations in 1949 were unchanged from the year previous, ranging from \$2.50–\$5.00 per gram, depending on quantities purchased.

World Review.—(See Germanium world review section of this chapter.)

GERMANIUM

Production.—Companies producing germanium metal and compounds in 1949 were the Eagle-Picher Lead Co., Joplin, Mo., and Saratoga Laboratories, Inc., Saratoga Springs, N. Y. The Donora

[44] Chemical and Engineering News, Gallium Isotope for Bone Cancer: Vol. 27, No. 25, June 20, 1949, p. 1819.

Zinc Works of the American Steel & Wire Co. (subsidiary of U. S. Steel Corp.), Donora, Pa., and the National Zinc Co., Bartlesville, Okla., produced germanium dioxide only. Output of germanium in 1949, almost all in the form of dioxide, was the highest on record and nearly 30 percent above 1948. Most of the germanium produced in the United States comes from the smelting of germanium-rich zinc ores mined in the Tri-State district of Missouri, Kansas, and Oklahoma; the zinc sulfide mineral in these ores contains about 0.01–0.1 percent Ge. The Bureau of Mines estimated Tri-State zinc-lead ore reserves as of December 31, 1947, at 66,100,000 short tons (based on a 1½-percent metal cut-off);[45] a corresponding recoverable content of zinc sulfide concentrates (60 percent Zn) was estimated at 2,402,433 tons. The germanium-metal content of such a quantity of concentrates would probably be between 240 and 2,400 tons. Reserve estimates covered only about 5 percent of the total areal extent of the district. The Eagle-Picher Co., largest producer of germanium, recovers the germanium, cadmium, and gallium contained in the zinc concentrates by means of a salt roast in the Dwight-Lloyd sintering process; the chloride of germanium, in particular, is readily volatilized and collected for further treatment.

Consumption and Uses.—Apparent consumption of germanium products, based upon producers' shipments, increased about 30 percent over 1948, being nearly identical to 1949 production. Germanium is consumed almost entirely by the electronics industry in making germanium diode crystal units, which are used for rectification of high-frequency currents, displacing certain types of vacuum tubes. A three-element unit holding great commercial promise, known as the transistor, is under intensive study in numerous private, Government, and Government-sponsored laboratories. Companies producing diodes and transistors are Sylvania Electric Products, Inc., Boston, Mass.; Kemtron, Inc., Beverly, Mass.; General Electric Co., Syracuse, N. Y.; Western Electric Division of Bell Telephone Co., Allentown, Pa.; and Raytheon Mfg. Co., Waltham, Mass. A tetrode, or four-element, germanium unit was described for which interesting commercial applications were claimed.[46]

Very little metallic germanium is purchased by electronics consumers, who prefer, instead, to buy the high-purity oxide and prepare their own metal from it. This situation exists, reportedly, because metal of high-enough purity is not yet available commercially. Essential, moreover, to the proper electronic function of germanium crystal units is the deliberate addition of minute traces of certain elements as impurities. Germanium (and silicon) may be made to carry electricity by conventional electron conduction (N-type) or by means of "positive" electrons (P-type); addition of trace impurities of nitrogen, phosphorus, antimony, or arsenic will form the N-type, and the P-type is produced by addition of boron, aluminum, gallium, or indium.[47] The quantity of impurity element required is so minute

that its introduction may be brought about successfully through neutron bombardment and consequent transmutation of some of the germanium atoms within the crystal to atoms of gallium or arsenic. By shielding portions of such a crystal during irradiation and subjecting the separate portions to different treatment, germanium crystals may be formed in which the various segments have distinctly different electrical characteristics.[48] Such crystals will function photoelectrically and have practical possibilities in this field.

Germanium (and silicon) metal, in thickness up to several centimeters, will give appreciable transmission of infrared radiation over broad regions of the spectrum.[49] Lenses of the metal for industrial infrared work were reported being made at Purdue University, Lafayette, Ind.[50]

Stocks and Prices.—Producers' stocks of germanium dioxide, small at the end of 1948, declined about 15 percent by the 1949 year end. High-purity germanium dioxide was sold for $65–$70 per pound in 1949, about the same as in 1948; the average price of metal was about $330 per pound, showing an appreciable increase over 1948.

World Review.—Commercially important quantities of the germanium sulfide mineral, renierite, have been discovered in the Prince Leopold copper mine of the Union Minière du Haut-Katanga at Kipushi, Belgian Congo.[51] Samples of renierite have shown a germanium content ranging from 6.37 to 7.80 percent.[52] The company reports that a process for extracting the germanium has been perfected and that, provided reasonable notice is given to permit organizing for industrial production, it could supply important quantities of germanium metal.

The occurrence of germanium in coal and its combustion products has been the subject of many recent investigations, particularly within the United Kingdom[53] and Commonwealth countries.[54] British researchers found that flue dusts from high chimneys of the producer systems of gas works in the United Kingdom contain about 0.75 percent each germanium and gallium; most of this dust is lost, however, only a small proportion settling in the flues.

INDIUM

Indium is a silvery-white metal slightly heavier than iron and so soft it may be easily scratched with the fingernail. In nature the element is found only as traces, most usually in certain zinc, lead, tin, tungsten, and iron ores. As much as 0.1–1.0 percent In has been reported in sphalerite and 0.1 in stannite. Commercial production of indium comes principally as a byproduct of zinc and lead smelting and related chemical industries.

Production.—The indium content of metal and compounds produced domestically in 1949 rose very considerably above the annual average for 1946–48, a period of negligible output, but still was far below that of 1941–45. Producers' shipments (indium content) in 1949 of 54,784 troy ounces were reminiscent of yearly movements during World War II and contrasted sharply with the 1946–48 average of only 11,926 troy ounces.

Producer and plant location:	*Products*
American Smelting & Refining Co., Denver, Colo., and Perth Amboy, N. J.	Indium metal and chemicals.
Donora Zinc Works, American Steel & Wire Co., (subsidiary U. S. Steel Corp.), Donora, Pa.	Indium metal.
Anaconda Copper Mining Co., Great Falls, Mont.	Do.
Cerro de Pasco Copper Corp., Brooklyn, N. Y.	Indium alloys of bismuth, tin, and other nonferrous metals.
Indium Corp. of America, Utica, N. Y.	Indium metal powder, sheet, wire, fabricated forms, alloys, chemicals, and plating solutions.
National Zinc Co., Bartlesville, Okla.	Indium metal.

Uses.—Indium finds its most important use as an unexcelled final plating for high-quality composite engine bearings, especially where high bearing loads, elevated operating temperatures, and severe conditions of lubricant corrosion are encountered. Indium solders are of growing importance. An indium-silver-lead composition is intermediate in applications between conventional low-melting solders and high-temperature brazing alloys. Indium-tin-lead solders containing 25 percent or more indium have notable resistance to corrosion by alkalies. A binary alloy with tin, marketed under the trade name Cerroseal-35, is finding wide application for making glass-to-glass and glass-to-metal seals; the alloy will also adhere to mica, glazed ceramics, and quartz and will solder metals bondable with standard lead-tin solders. (See Bismuth chapter of this volume for indium-bismuth alloys.)

Stocks and Prices.—Stocks of metal and compounds (indium content) held by producers at the 1949 year end declined 45 percent below 1948. The nominal quotation for 99.99 percent indium, first established in September 1945, has remained unchanged since that time. (Bismuth-indium alloy prices are given in the Bismuth chapter of this volume.)

World Review.—Consolidated Mining and Smelting Co. of Canada, Ltd., began production of 99.99 percent purity indium in 1949 at its Trail, B. C., works. Cerro de Pasco Copper Co., Oroya, Peru, is one of the world's largest indium producers. Peruvian output of indium in 1948 was 450,727 grams; production in 1949 was estimated at 645,449 grams.

LITHIUM

Production.—Producers are Maywood Chemical Works, Maywood, N. J., and Metalloy Corp. (subsidiary of Lithium Corp. of America), Minneapolis, Minn. Metalloy Corp. was engaged in expansion of production facilities in anticipation of enlarged demand for lithium

metal and compounds. (See Minor Nonmetals chapter of this volume for data on lithium minerals and compounds.)

Consumption and Uses.—Apparent consumption in 1949 of both lithium metal and alloys continued, as in 1948, at a level of a few thousand pounds.

Principal applications for lithium metal have centered around its use in the production of high-conductivity copper and copper-base alloys,[55] and as a starting point in the preparation of certain lithium compounds.

The alloys of magnesium and lithium have been intensively studied by the Navy Bureau of Aeronautics[56] and by private industry, notably the Dow Chemical Co., Midland, Mich. Addition of 10 percent by weight of lithium to magnesium exerts a profound effect, giving an alloy of appreciably greater ductility and workability as compared with lithium-free magnesium. On a strength-weight basis work-hardened magnesium-lithium alloys are comparable in yield and tensile strength to stainless steel type 301. Because of their extreme brittleness and instability at relatively low temperatures, further research is required before such alloys may be considered for structural applications.

Late in 1949 a great deal of publicity was given to the possibility of creating a thermonuclear atomic weapon. Lithium was frequently mentioned as a possible constituent of such a weapon, either in the form of lithium hydride or deuteride. These speculations were based upon the classic Cockcroft-Walton experiment, performed in the early 1930's, which demonstrated conclusively that a tremendous amount of energy is released when lithium atoms are bombarded with protons (hydrogen nuclei), giving rise to helium atoms as an end-product. Although a core of U–235 or plutonium would apparently be needed for detonation, the theoretical energy released in the resulting nuclear combination of lithium and hydrogen would, on the basis of equivalent weight, be over double that released in the complete fission of U–235 or plutonium.[57] The unstable heaviest isotope of hydrogen, tritium, has also received prominent mention in connection with thermonuclear reactions. Tritium is produced by bombarding the lithium isotope, Li–6, with neutrons.[58] Hydrogen deuteride gas is prepared in high-purity form through the interaction of heavy water with lithium aluminum hydride.[59] Stable lithium isotopes (Li–6, and Li–7), lithium deuteride, lithium aluminum deuteride, deuterium gas, tritium gas, deuterium oxide (heavy water), and tritiated water are available through the Oak Ridge, Tenn., isotope-distribution center of the Atomic Energy Commission. Lithium hydride and lithium-aluminum hydride are produced by Metal Hydrides, Inc., Beverly, Mass.

Prices.—Quotations for lithium metal in E&MJ Metal and Mineral Markets in 1949 opened the year at $15 per pound for metal of 98–99 percent purity. On June 9 the same figure was quoted, but for 98-percent grade only, and on September 15, the quotation fell to $9.85–$11.00 per pound, depending on quantity.

Canada.—Northern Chemicals, Ltd., engaged in developing spodumene deposits northeast of Winnipeg, Manitoba, during 1949; the company plans to establish a plant, possibly in Winnipeg, for producing lithium metal and compounds. (See Beryllium, world review discussion in this chapter.)

SELENIUM AND TELLURIUM

In nature, selenium and tellurium characteristically occur in copper sulfide and gold ores. Commercially, the elements are recovered, for the most part, from anode slimes accumulated in the electrolytic refining of blister copper. Noticeable quantities of selenium are present in the sedimentary uranium-vanadium ores at numerous localities in the Colorado Plateau. Attempts have been made in recent years to recover this selenium, which is otherwise lost in the vanadium-roaster stack gases.

Production.—Domestic selenium output in 1949 amounted to 468,502 pounds. Total United States production for the 10-year period 1939–48 was 4,627,201 pounds, the peak annual output being reached in 1943 when 635,581 pounds were recorded. Tellurium production in 1949 was 109,021 pounds, rising for the third successive year; the increase over 1948 was a notable 123 percent, however, there was no correlation between production and apparent demand. Tellurium output in the United States for 1939–48, inclusive, reached 863,395 pounds; the maximum production for any one year totaled 224,639 pounds in 1941.

Selenium and tellurium and their compounds are produced by the American Smelting & Refining Co., Baltimore, Md.; United States Metals Refining Co. (Chrome), Carteret, N. J.; and International Smelting & Refining Co., Perth Amboy, N. J. Tellurium and compounds are recovered from lead bullion by the United States Smelting, Refining & Mining Co., East Chicago, Ind.

Salient statistics of elemental selenium and tellurium in the United States, 1940–44 (average) and 1945–49, in pounds

Year	Selenium					Tellurium		
	Production	Producers' shipments [1]	Producers' stocks at end of year	Imports [2]		Production	Producers' shipments [1]	Producers' stocks at end of year
				Pounds	Value			
1940–44 (average)	515,335	462,531	333,519	119,098	$185,188	131,918	107,072	100,862
1945	458,486	604,445	371,258	216,793	395,934	89,750	60,328	183,527
1946	291,103	405,226	257,135	475,081	806,205	3,765	38,523	148,769
1947	512,648	489,415	280,368	529,175	893,171	45,248	71,300	122,717
1948	561,156	570,718	270,806	267,118	489,762	48,806	78,788	92,735
1949	468,502	317,960	334,067	171,581	317,145	109,021	64,278	135,605

[1] Bureau of Mines not at liberty to publish values.
[2] Includes selenium salts.

Consumption and Uses.—Apparent consumption (producers' domestic shipments plus imports) of selenium and tellurium in 1949 was 489,541 and 64,278 pounds, respectively, representing declines of 42 and 18 percent below 1948 figures.

Selenium is consumed principally in the glass, rubber, pigment, and electronics industries. Tellurium is much less important and limited in application. Principal uses are as an iron-foundry corewash for chill inducement and as an alloying agent in making tellurium-lead and tellurium-copper.

Stocks.—Producers' year-end stocks in 1949 rose 23 percent for selenium and 46 percent for tellurium as compared to the same period in 1948.

Prices.—Trade-journal quotations for selenium black and for tellurium in 1949 were $2.00 and $1.75 per pound, respectively, the same prices that prevailed in 1948.

Foreign Trade.—Imports for consumption of selenium and salts in 1949 came almost wholly from Canada, which country accounted for 170,354 pounds, valued at $316,771. There were no imports of tellurium or its compounds. Data on exports of selenium and tellurium are not available.

World Review.—Production of selenium in Canada closely parallels that of the United States in magnitude. Canadian production of selenium and tellurium in the period 1939–48, inclusive, totaled 3,698,578 and 85,180 pounds, respectively. In 1949 392,600 pounds of selenium, valued at C$804,830, and 52,700 pounds of tellurium, valued at C$94,860, were produced in Canada. Comparative figures for 1948 were, for selenium, 390,894 pounds (value C$781,788) and, for tellurium, 11,425 pounds (value C$19,994). In Canada, selenium and tellurium are recovered at the electrolytic copper refineries of the International Nickel Co. of Canada, Ltd., Copper Cliff, Ontario, and of Canadian Copper Refiners, Ltd., Montreal East, Quebec. The first-mentioned refinery has a proved capacity of 270,000 pounds of selenium a year; the plant of Canadian Copper Refiners, Ltd., with a production capacity of 450,000 pounds a year, is believed to be the largest in the world. At Copper Cliff, selenium is recovered from the Sudbury copper-nickel ores. The Montreal East operation extracts the element from copper anodes produced from the copper–gold ores of Noranda, Quebec, and from blister copper derived from the copper-zinc ores of Hudson Bay Mining & Smelting Co., Ltd., Flin Flon, Manitoba. The latter company reported selenium production from its own ores and purchased concentrates as 143,615 and 138,597 pounds in 1949 and 1948, respectively. Sales of selenium and tellurium in 1949 by the International Nickel Co. of Canada, Ltd. were 117,636 and 9,191 pounds. Consumption of tellurium metal in Canada, by steel and white metal foundries, in 1940–48, inclusive, was reported as 7,486 pounds.[60]

Selenium is produced in the Soviet Zone of Germany by the publicly owned operation Mansfeld Kupferbergbau und Hüttenwerke.

[60] Dominion Bureau of Statistics, Department of Trade and Commerce, Miscellaneous Metals Industry, 1948, pp. 16-17.

THALLIUM

Thallium is recovered commercially from residues accumulated in certain plants producing zinc and cadmium metal and chemicals, sulfuric acid, and white arsenic.

Production.—The American Smelting & Refining Co. is the sole domestic producer of thallium. Output in 1949 came from newly constructed recovery units located in the company cadmium refinery, Denver, Colo., and in its silver-lead smelter at Murray, Utah. In the latter operation, thallium was extracted from crude white-arsenic Cottrell dusts; this facility was shut October 1, 1949, along with the general closure of the Murray smelter. The completely new and much-enlarged thallium-recovery unit at the Globe smelter, which had been under construction in 1948, began operation early in 1949.

The arsenical gold ores at Mercur, Utah, are rich in thallium and probably constitute the largest domestic reserve of the element. Owners estimated the thallium content of old cyanide tailings dumps to exceed 4,000,000 pounds, with over 10 times that quantity in the unbroken ores.

Consumption and Uses.—The producer's shipments of both metal and thallium sulfate in 1949 were a few percent above 1948, suggesting a possible small rise in consumption. The principal application for thallium has been in the form of the sulfate, which is used as the active agent in some rodent poisons. Competition from organic rodenticides continued to be important; however, thallium preparations reportedly held a strong market position because of certain highly desirable specific toxic effects and the disinclination of rodents to develop an aversion to them. A possible important future bulk use of thallium is in the form of bromoiodide crystals in connection with infrared signal transmission in military and in research devices. The National Bureau of Standards was actively engaged throughout 1949 in the growth of such crystals; Harshaw Chemical Co., Cleveland, Ohio, produces thallium bromoiodide crystals on a commercial basis.

Prices.—The American Smelting & Refining Co. quoted thallium metal 99.9 percent, 10-pound lots, at $15 per pound until September 1949 and at $12.50 thereafter. The sulfate quotation was $15 until September, dropping to a figure of $10.50 for the remainder of the year.

World Review.—Certain of the Upper Silesian lead-zinc ores of Poland are noteworthy for their high thallium content. Hudson Bay Mining & Smelting Co., Flin Flon, Manitoba, Canada, accumulates thallium-rich residues from its base-metal smelting operations.

ZIRCONIUM AND HAFNIUM

Mine Production.—Almost the entire domestic zircon output in 1949 was accounted for, as in every year since April 1944, by the Rutile Mining Co. of Florida, South Jacksonville, Fla.; zircon is recovered as a coproduct with ilmenite and rutile concentrates. A very small 1949 production of zircon came from the Florida Ore Processing Co. works near Melbourne, Fla. The new titanium-

mineral plant of E. I. du Pont de Nemours & Co., near Starke, Fla., from which very large quantities of zircon will ultimately be derived, began operations early in 1949; the planned intake capacity of 25,000 tons of sand per day was approached late in the year. Unforeseen obstacles encountered, within the sand deposit, such as coarse organic debris (logs and roots), and excessively hard layers of sediments which required blasting, seriously hampered dredging operations. Functioning of the concentrating plant (Humphrey spirals), aside from being affected by intermittent sand feed, was complicated by the presence of tanninlike substances which so darkened the mill water that excessively wide cuts were required on the spirals to prevent undue loss of titanium minerals; the grade of concentrate suffered as a consequence. Clogging of mill screens by roots also caused serious difficulty and, finally, discharge of the dark mill effluent into streams aroused local protest.

The du Pont plant is operated under contract by the Humphreys Gold Corp.; zircon is contained in the tailings from the operation which are being impounded with a view to its subsequent removal. The Humphreys Gold Corp. is reported to have constructed nearby a small plant for the zircon recovery which will be undertaken when market conditions for the mineral improve. Any zircon recovered will, by agreement, be for the account of Humphreys Gold Corp.

Titaniferous black sands containing important quantities of zircon are extensively distributed through central and northeastern Florida from northeast of Jacksonville to northwest of Lake Okeechobee, according to a Bureau of Mines report.[61] Zircon is abundant in the gold-monazite gravels flanking the granite areas of central Idaho and, with the gradual development of monazite recovery in that region, may eventually be producible in significant tonnage. Freight rates to eastern consumers would be prohibitive, at any price paid for zircon concentrates to date; consequently, western consuming centers probably would have to be developed. Zircon is also abundant in central California gold gravels and may likewise eventually be recovered commercially.

There seemed little doubt that by the end of 1949 the United States had achieved a position of self-sufficiency with respect to zircon, possibly well over any domestic requirements yet reached. That this favorable situation developed only incidentally to the exploitation of the sand deposits for their titanium contents serves to emphasize the importance of maintaining a stable titanium mineral industry in Florida.

Refinery Production.—Companies and others producing zirconium metal, alloys, compounds, and refractories and hafnium metal and compounds are as follows:

[61] Thoenen, J. R., and Warne, J. D., Titanium Minerals in Central and Northeastern Florida: Bureau of Mines Rept. of Investigations 4515, 1949, 62 pp.

Organization and plant location:	Products
American Electro Metal Corp., Yonkers, N. Y.	Zirconium boride (experimental).

The Rohm & Haas Co. curtailed some of its zirconium activities in 1949, discontinuing the manufacture of zirconia enamel opacifier; however, it continued active in production of zirconium tanning compounds and other items. F. W. Berk was reported as nearing production of zirconia, potassium zirconium fluoride, and various ceramic and refractory materials.[62] Beryllium Corp. has in years before 1949 produced zirconium-copper and zirconia refractories; the company reports that it has a fully equipped facility for production of zirconium compounds which is being kept in stand-by condition. Upon completion of its expanded pilot plant at Albany, Oreg., in 1949, Bureau of Mines production of ductile zirconium metal increased sharply over that reported in 1948.[63] Efforts continued to produce hafnium-free metal. Interest was reported on the part of the Atomic Energy Commission, the Navy, and other Government agencies.

Consumption and Uses.—Domestic zircon consumption in 1949 is estimated to have been around 20,000 tons, declining about 20 percent below 1948. Percentage distribution of zircon consumed by

[62] Chemical Industries, vol. 64, No. 2, February 1949, pp. 207-208.
[63] Steel, vol. 125, No. 2, July 11, 1949, p. 72.

industry in recent years, according to general fields of use, is reported to be approximately as follows: Ceramics (except refractories), 32; refractories, 20; oxides and chemicals, 20; foundry sand, 16; and alloys, 12. Producers' shipments of zirconium alloys in 1949 halved those for 1948.

Zirconium metal, particularly in its ductile form, has been the object of much recent attention.[64] Because of the nearly identical methods used for producing zirconium and titanium metals and, further, because of the close association of their minerals in many commercial deposits, development of the technology of the two metals has shown a close parallel. Unlike titanium, however, which evidences great promise as a structural metal, zirconium appears to stand out most notably because of its superior corrosion resistance and ready workability. In resistance to hydrochloric acid corrosion, zirconium is close behind tantalum and far superior to the latter in resistance to caustics, being unaffected by molten caustic soda. Thus, the most likely future applications for ductile zirconium metal appear to be, like tantalum, in the chemical industry. Again, like tantalum, zirconium is unaffected by body fluids, hence should find many uses in the surgical field in the form of plates, wire, and gauze.

The fact that zirconium metal has a very low tendency to absorb slow neutrons, combined with a relatively high melting point (1,860° C.) and its ease of formability and corrosion resistance, have made it a material of much interest in the field of atomic energy. It seems apparent that its use in place of aluminum for the jackets that house the uranium-metal slugs in present-day atomic piles would permit operation at temperatures well above the melting point of aluminum, which is now presumably a limiting factor.[65] Almost all zirconium metal produced to date has contained about 2 percent of the element, hafnium, which is so closely akin to zirconium chemically as to make its separation on a practical scale exceedingly difficult; nonetheless, its separation is mandatory, for the slow neutron-absorption tendency of hafnium is very high. Pure hafnium metal appears to have formability, corrosion resistance, and a high melting point, similar to zirconium; this set of properties, combined with its aforementioned nuclear characteristics, suggests its possible value as a material for protective shielding. Other metals, notably those in the platinum group, have roughly similar properties, but only hafnium would conceivably be obtainable in ton quantities and from readily available raw materials should demand warrant.

Nonductile zirconium has been available in quantity for many years and has found use principally in powder form as a pyrophoric substance in flashlight powders and flares. Lighter flints made from lead, impregnated with zirconium powder,[66] are alleged to have intense sparking properties and may possibly become competitive with conventional ferrocerium flints; however, it is reported that certain difficulties involved in their quantity production and use have yet to be resolved.

Zirconium is important in certain steel making, ordinarily being added in the form of zirconium-ferrosilicon alloy; its function is that of a powerful deoxidizer, degasifier, and grain refiner, zirconium-treated steels being particularly suitable for tools subject to violent stresses, such as rock drills.

Zirconium has a strong affinity for sulfur and may be used to reduce hot shortness in high-sulfur steel and for the production of nodular cast irons in a manner similar to cerium and magnesium. The low-zirconium alloys CMSZ and SMZ are added to cast iron to promote density, machinability, and strength. Silcaz (3 to 5 percent Zr) acts as an intensifier in the preparation of boron steels. The zirconium content of various steel or cast-iron products containing the element is reported to range from less than 0.05 to 0.20 percent Zr.

In the field of magnesium alloys, zirconium is rapidly becoming of great importance; zirconium has a greater grain-refining effect on magnesium than any other metal and furthermore, confers better workability, strength, and toughness.[67] The extrudable alloy ZK–60 (0.6 percent Zr and 6.0 Zn) is reported being used as floor beams in the Douglas DC–6 airplane, and designers have given consideration to the use of ZK–60 in the construction of a proposed all-magnesium airplane. Zirconium is an essential constituent of EK–30 alloy, now employed extensively in military aircraft. (See Cerium and Other Rare-Earth Metals section of this chapter.)

Zircon is widely employed as an acid-type refractory, being especially useful in linings for glass[68] and aluminum melting furnaces. Zircon has been used as an ingredient (20–60 percent) of high-temperature porcelains for many years because of its thermal shock resistance.[69]

Baddeleyite, like zircon, is very important as a glass-furnace refractory; its use in production of ferrozirconium alloys is reportedly being supplanted in large part by zircon. Zirconia, the chemically prepared oxide, has valuable properties as a refractory when stabilized with small additions of lime or magnesia.[70] In fused form, stabilized zirconia is reported to have made practicable the continuous casting of steel; liners of the material are said to be in use, or contemplated for use, in oil refineries and synthetic gasoline plants, presumably in the catalytic cracking towers or high-temperature reaction chambers.

Large quantities of unstabilized zirconia are employed as a glaze and porcelain opacifier. Other commercial applications of zirconium compounds are in high-duty dielectrics (alkaline-earth zirconates), organic chemical catalysts (zirconia gel), textile water repellents (zirconium acetate), tanning agents (zirconyl sulfates) and special refractories (zirconium nitride and zirconium boride).

Stocks.—In 1949 industry year-end stocks of zircon concentrates (65 percent ZrO_2), including some baddeleyite, were about 8,700 short

tons as compared to 6,500 for 1948. Mixed zircon-rutile concentrate stocks fell to only 300 tons (zircon content, 250 tons); comparable figures for 1948 and 1947 were, respectively, 5,700 tons (zircon content 4,100) and 12,600 (zircon, 9,300). Both zircon and baddeleyite are included on the strategic materials list of the National Stockpile.

Prices.—E & MJ Metal and Mineral Markets quoted zircon concentrate (65 percent ZrO_2), c. i. f. Atlantic ports, at $45–$48 per ton at the beginning of 1949; declines were noted to $42–$45 on May 26, and to $40–$45 on December 22. Generally lower consumer demand and large zircon stocks held by producers and consumers alike contributed toward the lowering of zircon prices. Trade-journal quotations on zirconium metal, alloys, and compounds showed no change from 1948.

Foreign Trade.—Before March 1948, the United States had received most of its zircon imports from Australia, the principal foreign supplier, in the form of mixed zircon-ilmenite-rutile-monazite concentrates. Thereafter, the Australian Government banned the export of mixed concentrates containing 0.5 percent, or more, of monazite because of its desire to conserve the latter mineral for possible atomic energy use. Mixed sands may still be shipped, however, provided the monazite content is under 0.5 percent. Thus, about 5,500 tons of mixed Australian zirconiferous sands were received by the United States in 1949. The Commonwealth Government, however, reportedly does not favor even this export of mixed sands because of the lower net dollar return as compared with concentrates of the separated component minerals, zircon, rutile, and ilmenite.

Exports of zirconium ore and concentrates went principally to Canada in 1949; total for all countries was 305 tons, valued at $23,654; total shipments in 1948 and 1947 were 312 and 330 tons, respectively. Export shipments of zirconium metal and alloys in 1949 were 74,346 pounds, value $12,942; Canada and the United Kingdom received the bulk, 51,639 and 22,452 pounds, respectively. Comparable total shipment figures for previous years were: 1948, 21,966 pounds; 1947, 9,592; and 1946, 2,377.

Zirconium ore (concentrates)[1] imported for consumption in the United States, 1945–49, by countries, in short tons

[U. S. Department of Commerce]

Year	Australia[2]	Brazil	Canada	French West Africa (Senegal)	India	Total: Short tons	Total: Value
1945	25,672	792	----------	6	----------	26,470	$554,400
1946	14,379	2,431	4	----------	----------	16,814	453,458
1947	21,894	4,619	3	----------	4,181	30,696	891,161
1948	[3] 14,320	3,553	2	----------	279	[3] 18,154	[3] 571,161
1949	18,839	1,994	----------	----------	----------	20,833	636,529

[1] Concentrates from Australia are zircon or mixed zircon-rutile-ilmenite, and those from Brazil are baddeleyite or zircon. All other imports are zircon.

[2] Imports of zircon, rutile, and ilmenite from Australia until early 1948 were largely in the form of mixed concentrates. These mixed concentrates are classified by the U. S. Department of Commerce arbitrarily as "zirconium ore," "rutile," or "ilmenite." Total zircon contents of the "zirconium ore" (as shown in this table) and of the "rutile" and "ilmenite" concentrates (see Titanium chapter) are estimated as follows: 1945, 17,138 tons; 1946, 11,535 tons; 1947, 22,727 tons; 1948, 13,873 tons; and 1949, 14,623 tons.

[3] Revised figure.

WORLD REVIEW

Australia.—Although outstripped by the United States in 1949 from the standpoint of potential productive capacity, Australia has been the world's largest producer of zircon during most of the period from the mid-1930's to date. By 1948 the Australian industry was reported equipped to produce 26,000 long tons of zircon a year.[71] Zircon Rutile, Ltd., the largest Australian producer of black-sand concentrates, stated in its annual report of midyear 1949 that the market for company products, which had been quiet in late 1948, gradually deteriorated in the first half of 1949.[72]

Consumers in the United States constitute the principal market for Australian zircon. American buyers were reluctant to foreorder in 1949 because of development of deposits of heavy minerals in Florida, the trade recession, and overlarge inventories. National Titanium Pigments, Ltd. (subsidiary of Laporte Chemicals, Ltd.), in the United Kingdom was reported acquiring an interest in Zircon Rutile, Ltd. The latter concern would supply the raw materials needed for the manufacture of chemical products in Australia. The possibility of producing zirconium sulfate was being investigated.[73] In 1948 large-scale prospecting was conducted by a subsidiary of the Barrier zinc companies, Titanium & Zirconium Industries Pty., Ltd.; reserves of zircon on North Stradbroke Island, Queensland, were reported comparable to those of Trail Ridge, Fla., in the United States. In 1949, the company undertook construction of a sand treatment plant on Stradbroke Island incorporating Humphrey Spirals, a Dutch State Mines Cyclone, and magnetic and electrostatic separators.[74]

United Kingdom.—Zirconium alloys of the ferrous and nonferrous metals are made by Blackwell's Metallurgical Works, Ltd., Liverpool, and by Murex, Ltd., Rainham, Essex. The latter company also produces zirconium metal and hydride. Zirconium compounds are made by Imperial Chemical Industries, Ltd., Liverpool.

Minor Nonmetals

By D. G. Runner and J. C. Arundale[1]

GRAPHITE

PRODUCTION and sales of domestic graphite in 1949 were substantially lower than in 1948. Production of crystalline and amorphous graphite amounted to 6,102 short tons, and shipments were estimated at 5,213 tons valued at $475,264. The manufacture of artificial graphite continued to increase, but the Bureau of Mines is not at liberty to publish detailed figures for this type of graphite. There are too few domestic producers to allow publication of separate statistics on natural crystalline and amorphous graphite. However, the accompanying table shows combined figures for 1945–49.

Two reports covering investigations of graphite deposits in New York and Pennsylvania have been released.[2]

Production and shipments of natural graphite in the United States, 1945–49

Year	Production (short tons)	Shipments: Short tons	Shipments: Value	Year	Production (short tons)	Shipments: Short tons	Shipments: Value
1945	4,888	5,334	$289,207	1948	9,949	9,871	$450,759
1946	5,575	4,844	252,596	1949	6,102	[1] 5,213	475,264
1947	4,387	5,207	221,260				

[1] Partly estimated.

Consumption.—Although the coverage of the graphite consumption canvass is incomplete, the totals obtained indicate at least the minimum quantities of graphite used in making various products. The 1949 totals for the various uses are as follows:

Consumption of natural graphite in the United States in 1949, by uses

Use	Short tons	Value	Use	Short tons	Value
Foundry facings	5,525	$397,031	Paints and polish	186	$11,567
Batteries	2,626	131,222	Packings	178	68,343
Lubricants	2,290	393,035	Retorts	96	22,167
Crucibles	2,035	447,047	Bearings	22	9,222
Stoppers, sleeves, and nozzles	912	158,726	Other[1]	1,587	514,743
Pencils	845	584,939	Total	16,302	2,738,042

[1] Includes brake lining, carbon brushes, electrodes, etc.

[1] Figures on imports and exports compiled by M. B. Price and E. D. Page, of the Bureau of Mines, from records of the U. S. Department of Commerce.

[2] Millar, W. T., and Sanford, Robert S., Investigation of Suffern Graphite Deposits, Rockland County, N. Y.: Bureau of Mines Rept. of Investigations 4438, 1949, 6 pp.

Sanford, Robert S., and Lamb, Frank D., Investigation of the Benjamin Franklin Graphite Mine (Government-Owned) and the Just Graphite Mine, Chester County, Pa.: Bureau of Mines Rept. of Investigations 4530, 1949, 17 pp.

Prices.—Quotations for graphite were fairly stable during 1949, and at the year end the trade-journal listings were as follows, f. o. b. New York: Madagascar, c. i. f., New York, standard grades, 85 to 87 percent carbon, $210 per ton; special mesh, $265–$300; special grade 99 percent carbon, $700. Amorphous graphite, Mexican, f. o. b. point of shipment (Mexico), per metric ton, $9–$16, depending on grade.

Foreign Trade.—As shown in the accompanying table, imports of all types of graphite in 1949 declined sharply from the total of 1948. The imports amounted to 31,805 short tons valued at $1,260,467—a decrease of 39 percent in quantity and 38 percent in value from the 1948 figures. Quantitywise, natural amorphous shows the greatest change, decreasing from 48,150 tons valued at $1,529,312 in 1948 to 29,298 tons valued at $954,388 in 1949. This drop in total imports was caused largely by decrease in imports from Mexico.

Graphite (natural and artificial) imported for consumption in the United States, 1945–49

[1] Less than 1 ton.
[2] Revised figure.

The United States tariff rates on graphite, effective January 1, 1948, were still in force during 1949. They are: Amorphous natural and artificial, 5 percent ad valorem; crystalline flake, 15 percent ad valorem, with a specific minimum of 0.4125 cent per pound and a specific maximum of 0.825 cent per pound; crucible flake and dust and other crystalline lump and chip 7½ percent ad valorem.

Exports of natural graphite, 1945–49, were: 1945, 1,308 tons, $134,414; 1946, 2,313 tons, $267,137; 1947, 1,546 tons, $171,607; 1948 (revised figures), 1,047 tons, $127,931. Data for 1949 are shown in an accompanying table.

Graphite exported from the United States in 1949 [1]

[U. S. Department of Commerce]

[1] In addition to countries listed, graphite has been produced in Bulgaria, Greenland, Nyasaland, and U. S. S. R., but production data are not available. No estimates for these countries are included in totals.
[2] Data not available; estimates by author of chapter included in total.
[3] January to September, inclusive.
[4] January to June, inclusive.
[5] Includes scrap.
[6] Estimated Japanese imports from Manchuria.
[7] Data revised in some instances to represent refined graphite rather than crude or mined.
[8] Fiscal year ended March 31 of year following that stated.
[9] Estimate.
[10] Less than 1 ton.
[11] South Korea only.
[12] Exports.

In normal times Madagascar can produce over 12,000 metric tons of graphite per year. A cyclone on March 7, 1949, struck graphite-producing areas and delayed production at many of the mines on the island.[3] This storm and a shortage of jute bags delayed somewhat the normal output in the first half of 1949 but production in the latter half was reported to be back at the standard rate.

An announcement has been made of an agreement between the United States and France whereby Madagascar will sell 19,800 metric tons of graphite to the United States. This agreement, stipulating that the material will be delivered at the rate of 3,000 tons annually, was authorized after taking into account French domestic needs and foreign trade requirements.[4]

[3] Bureau of Mines, Mineral Trade Notes: Vol. 28, No. 5, May 1949, pp. 31–32.
[4] Chemical and Engineering News, vol. 27, No. 6, Feb. 7, 1949, pp. 349–350. Mining World, vol. 11, No. 9, August 1949, p. 53. Engineering and Mining Journal, vol. 150, No. 3, March 1949, p. 86.

As announced in the "Journal Officiel de Madagascar et Dependencies" for January 7, 1950, the minimum f. o. b. export price, in CFA francs, for Madagascar graphite was raised as of January 1, 1950. However, the new order, made because of the recent franc devaluation, does not change the minimum f. o. b. price in U. S. dollars established October 1, 1948.[5] The prices are shown in the accompanying table.

Minimum export price of graphite, f. o. b. Madagascar, in 1949

Flake		Powder (fines)	
Carbon, percent	Price per metric ton	Carbon, percent	Price per metric ton
85.0–87.5	$150	72.5–77.5	$82
87.6–89.5	156	77.6–82.5	96
89.6–92.5	164	82.6–87.5	116
92.6–94.9	185	87.6–89.9	143
95.0 and over	Not fixed	90.0 and over	Not fixed

Developments in the graphite field throughout the world hold some promise of future ample supplies. In Ceylon, the Bogola Graphite Corp., and the Pilot Industrial Trust, Ltd., of London, have organized to increase graphite production from 500 tons a month to 2,000 tons and to establish secondary industries.[6]

Recent reports state that preliminary surveys, to include graphite, are planned for Tanganyika[7] and that prospecting is being conducted at a graphite deposit inland from Trujillo, Peru.[8] Other reports state that conditions are good for the development of large graphite deposits in the State of Espirito Santo, Brazil.[9]

GREENSAND

In all, 5,172 short tons of greensand were produced during 1949 by the following companies: The Permutit Co., 330 West Forty-second Street, New York 18, N. Y.; Zeolite Chemical Co., Medford, N. J.; and the Inversand Co., 226 Atlantic Avenue, Clayton, N. J. All production was from open-pit operations in Burlington and Gloucester Counties, N. J., and was sold for water softening and purification.

Price of refined greensand, f. o. b. shipping point, ranged from approximately $62–$114 per short ton.

Greensand marl sold or used by producers in the United States, 1945–49

Year	Short tons	Value	Year	Short tons	Value
1945	4,986	$477,919	1948	7,269	$392,959
1946	5,140	424,900	1949	6,128	276,564
1947	8,337	432,980

KYANITE, ANDALUSITE, SILLIMANITE, AND DUMORTIERITE

The domestic production of kyanite in 1949 declined from the record output of the preceding year. Imports from British East Africa and India, the principal foreign sources, decreased considerably from the 1948 totals. The consumption of imported kyanite likewise declined.

Production.—Output of domestic kyanite in 1949 totaled 12,115 short tons ($403,169) compared with 14,552 tons ($527,042) in 1948.

Three companies reported production of kyanite in 1949. A. P. Green Firebrick Co., Mexico, Mo., produced from its operation in Habersham County, Ga., and used it in the manufacture of refractories. The company subsequently closed the mine.[10] Kyanite Mining Corp., Cullen, Va., produced kyanite near Farmville, Prince Edward County, Va., and sold the output for the manufacture of refractories, pottery, and brick. Commercialores, Inc., 39 Cortlandt Street, New York, N. Y., produced kyanite from a deposit near Clover, S. C.[11] The material is sold for the manufacture of high-temperature fire brick, cement, etc.

The Technical Porcelain & Chinaware Co., El Cerrito, Calif., produced a small amount of andalusite from its Mineral County, Nev., mine and used this material in the manufacture of chinaware. A small quantity of dumortierite was produced by R. A. Stranahan, Jr., 900 Upton Avenue, Toledo, Ohio, from his Pershing County, Nev., open-pit operation; it was used in the production of spark-plug insulators.

Search for sillimanite deposits of commercial importance continues to show promise in certain areas of the United States. Geologists are continuing investigations of mica and sillimanite deposits in the Piedmont section.[12]

Reports on deposits of sillimanite minerals in Madison County, Mont.,[13] and on the occurrence of sillimanite in New Castle County, Del., have been released.[14] Other papers dealing with uses of sillimanite appeared in the press during 1949.[15]

Consumption and Stocks.—Consumption of imported kyanite was 9,655 short tons in 1949 compared with 11,770 tons in 1948 and 13,807 tons in 1947.

Year-end stocks of imported kyanite were 4,664 tons in 1949 compared with 5,538 tons in 1948 and 1,436 tons in 1947. These figures exclude material in the National Stockpile.

Prices.—Trade-journal quotations for domestic kyanite in December 1949, per ton f. o. b. point of shipment Virginia, were: 35-mesh, carlots, in bulk $26; in bags, $29; for 200-mesh, in bags, carlots, $37. Imported kyanite, in bags, c. i. f. Atlantic ports, $30–$40 per ton, nominal.

Foreign Trade.—Data on imports and exports of kyanite and allied minerals are shown in the accompanying table.

			Switzerland	20	816
Total	12,119	324,856	Total	1,039	46,725

[1] Includes the following quantities credited by the U. S. Department of Commerce to Union of South Africa: 1948—338 tons, $4,876; and 1949—11 tons, $242.

Kenya and India.—As reported in the 1948 chapter, attention has been centered on procuring kyanite of suitable quality for stockpiling from Kenya Colony, British East Africa. The uncertainty of production and transportation facilities in India has made it necessary to arrange for other sources of supply. To this end the Economic Cooperation Administration announced approval of a plan to assist in the expansion of kyanite production in Kenya. Money will be provided for purchasing mining machinery to foster this increased output. The plans call for the production of Kenya Kyanite, Ltd., to be raised from 25,000 to 37,000 short tons a year. The increased output is to be sold to the United States for the National Stockpile.[16]

The Geological Survey of India, Calcutta, names the following important occurrences of Kyanite in India: Himalaya—abundant in schists and granites of Bashahr; Hyderabad—Charribpet in the garnet mines, Warangal Taluk; Madras—Coimbatore district, near Kanjikovil, Nellore district, one half mile west of Marasimha Kandrika, 3 miles west northwest of Podalkur; Punjab—Patiala, in the hills west of Narnaul; Bihar—Manbhum, Singhbhum (Lapsa Baru), Dhalbhum, Rakha Mines; Badia—Mushabani, Kanyaluka, and Shirbai; Mysore—Mavinkere Taluk.[17]

LITHIUM MINERALS

A growing interest in lithium minerals and compounds resulted in increased production of lithium minerals during 1949. The lithia content of the ores shipped was exceeded only in the war year

[16] Mining Journal, vol. 232, No. 5934, May 14, 1949, p. 359. Mining and Industrial Magazine, vol. 39, No. 7, July 1949, p. 387. Mining World, vol. 11, No. 9, August 1949, p. 53. Mining Journal. vol. 233, No. 5951, Sept. 10, 1949, p. 830.

[17] Bureau of Mines, Mineral Trade Notes: Vol. 29, No. 4, October 1949, p. 32.

1944. In the last decade, lithium minerals and compounds have risen from little-known and little-used substances to important industrial, chemical, and metallurgical materials. In ceramic and petroleum products, metallurgy, organic synthesis, storage batteries, air conditioning, and welding, lithium compounds find important applications; they are the subject of an increasing number of patents, and many possible new uses are being suggested. During World War II, the hydride was used in large quantities as a carrier of hydrogen for inflating naval balloons.

Production.—In 1949 the following firms reported production of lithium ores and compounds: American Potash & Chemical Corp., 3030 West Sixth Street, Los Angeles 54, Calif., on Searles Lake (crude sodium lithium phosphate); Black Hills Keystone Corp., Keystone, S. Dak. (amblygonite and spodumene); Lithium Corp. of America, Inc., 2560 Rand Tower, Minneapolis, Minn., plant at Keystone, S. Dak. (spodumene); Robert McRobbie, Custer, S. Dak. (spodumene); Maywood Chemical Works, Maywood, N. J., mine at Keystone, S. Dak. (spodumene); and Whitehall Co., Keene, N. H., mine at Newry, Maine (spodumene).

Shipments of lithium ores and compounds from mines in the United States, 1935–39 (average) and 1945–49

Year	Ore (short tons)	Value	Li_2O (short tons)	Year	Ore (short tons)	Value	Li_2O (short tons)
1935–39 (average)	1,327	$48,280	88	1947	2,441	$151,113	199
1945	2,446	285,520	274	1948 [1]	3,881	210,792	291
1946	3,065	303,892	323	1949	4,838	345,970	475

[1] Revised figures.

Uses.—An article described results of experiments in the use of lepidolite in semivitreous and vitreous bodies of low maturing temperatures.[18] The effect of lithia on the properties of a titania cover enamel were reported.[19] An article described the use of lithium compounds in vitreous enamel.[20]

Late in 1949 considerable publicity was given to the news that the United States was considering an attempt to develop a "lithium-hydrogen bomb," which, in theory, would have fantastic explosive power, many times that of the first atomic bombs.

The use of lithium chloride as a substitute for salt in "salt-free diets" was condemned as a dangerous practice by the Food and Drug Administration after reports of injury to persons using such material.

A booklet was published summarizing the properties and uses of lithium and lithium chemicals as presented in the literature since 1940.[21]

[18] Donahey, J. W., and Clark, J. D., Lepidolite, a Neglected Cost-Cutting Flux: Ceram. Ind., vol. 53, No. 5, November 1949, pp. 74–76 and 94.
[19] Cook, Ralph L., and Essenpreis, James F., Effect of Soda, Potash, and Lithia on Physical Properties of a Titania Cover Enamel: Jour. Am. Ceram. Soc., vol. 32, No. 3, 1949, pp. 114–120.
[20] Fenton, W. M., and Huppert, P. A., Influence of Certain Compounds of Lithium in Vitreous Enamel: Sheet Metal Ind., vol. 25, No. 259, 1948, pp. 2255–2259.
[21] Foote Mineral Co., Lithium in Modern Industry: Philadelphia, January 1950, 25 pp.

Research quantities of lithium deuteride and lithium aluminum deuteride were made available by Metal Hydrides, Inc., Beverly, Mass., on orders bearing license from the Atomic Energy Commission.[22]

Prices.—Trade journal quotations of prices for lithium ores were as follows: Amblygonite, per ton, air-floated, carlots, $110; lepidolite, per ton, 4 percent Li_2O, powdered, carlots, $80; spodumene, per unit lithium oxide contained, $6–$8 on 6-percent grade, carlots. These prices represent no appreciable change from 1948.

The American Potash & Chemical Corp., Trona, Calif., reported the price of dilithium sodium phosphate at about $170 per ton.

Canada.—Northern Chemicals, Ltd., proceeded with the development of the spodumene deposit at Cat Lake, about 90 miles northwest of Winnipeg, Manitoba.[23]

MEERSCHAUM

Meerschaum is a soft, fine-grained, earthy, white, gray, or yellow material having the composition of $H_4Mg_2Si_3O_{10}$. The few scattered deposits known in the United States have yielded only a small production. The meerschaum deposits in Asia Minor have produced virtually the world's supply, which has been used in the manufacture of pipes and other smokers' articles. As indicated in the following table, imports from Turkey in 1949 increased to the 1947 level.

Meerschaum imported for consumption in the United States, 1945–49 [1]

[U. S. Department of Commerce]

Year	Pounds	Value	Year	Pounds	Value
1945	33,292	$59,418	1948	3,000	$10,079
1946	14,469	21,785	1949	5,844	13,897
1947	5,758	10,534			

[1] All from Turkey.

MINERAL-EARTH PIGMENTS

The economics and recent trends of the mineral pigments industry were outlined in a paper published in 1949.[24]

Production.—Demand for mineral-earth pigments declined somewhat in 1949, and sales of most items were lower than in the previous year. The early part of the year was slow, but as building and general industrial activity improved, demand for pigments increased during the latter part of 1949. Of the 89,628 tons of pigment reported, the natural red oxides constituted 20 percent, pure red oxide 18 percent, "other red oxides" 18 percent, and pure yellows 10 percent.

[1] Included with "Other."

Uses.—The optical properties, hiding power, and surface chemistry of pigments and a discussion of new pigments and some important improvements in old ones during the past 25 years were the subjects of a paper.[25]

Prices.—According to the Oil, Paint and Drug Reporter, prices were quoted as follows during December 1949 (in cents per pound, bags, works, carlots, unless otherwise noted):

Synthetic iron brown (l. c. l.), 12½.
Metallic oxide brown, 3–3½.
Sap brown, crystals, 12.
Sap brown, powdered, 13.
Sienna, burnt, 3¾–14¾.
Sienna, raw, 4–12¾.
Umber, burnt, American (barrels), 4¾–5¾.
Umber, Turkey type, 5¾–7¾.
Vandyke (barrels), 9¾–12.
Synthetic red iron oxide, 11½–11¾.
Special, high color, synthetic red iron oxide, $1.
Persian Gulf oxide, 6¾–7.
Spanish oxide, Grade 1 (barrels), ex dock, 5½–5¾.
Spanish oxide, Grade 2 (barrels), ex dock, 5¼–5½.
Venetian reds, 3.5–4.9.
Natural yellow iron oxide, 1.41–2.5.
Natural yellow iron oxide, French type, 4¼.
Synthetic yellow iron oxide, 9.
Golden American yellow ocher 1½–2¾.
Metallic red (barrels), 2½–2¾.
Synthetic iron oxide black, 10¾.
Mineral black, 1.6–6.75.

Foreign Trade.—Imports and exports of mineral pigments are shown in the accompanying tables.

[1] Less than 1 ton.

MINERAL WOOL

The value of mineral wool used in housing was $41,749,425 for 1949 compared with $45,819,000 for 1948, according to estimates by the National Mineral Wool Association. The Industrial Mineral Wool Institute estimated 1949 sales for "industrial power and process

equipment and cold-storage structures" and "domestic and commercial equipment, cargo, freight and passenger end uses" at about \$23,432,000 compared with \$21,000,000 in 1948. Details of the various kinds of mineral wool shipped in 1947 were published by the Bureau of the Census and summarized in Minerals Yearbook, 1948 (p. 1362).

New plants and improved techniques have been noteworthy in the industry in 1949. Superior Insulation Manufacturing Co., Duluth, Minn., started production of rock wool. In addition to white wool the company has introduced a dark mineral wool utilizing traprock as a part of the raw batch.[26] Rock Products Corp., Ada, Okla., is planning to construct a rock-wool plant at Ada, and to use dolomite quarried at Troy, Okla.[27]

Articles covering the manufacture of mineral wool and increasing the efficiency of operation appeared in the press during 1949. These reports discuss cupola heat balance and fuel ratio, estimating cupola output, use of cupola gases under boilers, and cupola operation, furnace types, etc.[28]

Automatic packaging for mineral wool has received attention,[29] and a description of an acoustical tile called "fissuretone" has been released.[30] Mention has been made of new engineering standards for the use and application of mineral-wool insulation in plants and refineries. These standards, CS-105 on low-temperature installations and CS-117 on heated industrial equipment, have been prepared by the National Bureau of Standards in cooperation with the Industrial Mineral Wool Institute.[31]

Several United States patents dealing with mineral wool have been released; No. 2,451,582 covers improvements in a furnace, 2,450,916 apparatus for forming mineral-wool mats, 2,450,511 apparatus for diverting mineral wool from blow rooms, 2,450,013 apparatus for producing rock wool, and 2,450,915 forming mineral-wool products.[32]

MONAZITE

Monazite is important commercially as the principal source of the rare earths and thorium. However, statistics on imports and consumption of monazite are considered confidential and cannot be published for 1949. In former years, India and Brazil have been the most important sources; but in recent years India has imposed a virtual embargo on exports of monazite, and increasing difficulty has been encountered in obtaining it from Brazil. There were reports of considerable agitation in Brazil to restrict the exportation of monazite. Both of these countries are considering large-scale processing of monazite into rare-earth and thorium products. The Indian Government entered into an agreement with two French firms, Banque

Marocaine de Credit and the Société des Produits Chimiques des Terres Rares, to establish a plant for processing the monazite found in the State of Travancore.[33]

In 1949 an increased interest in domestic deposits of monazite was evident. This was probably the result of several factors, such as the difficulty of procuring supplies from the usual foreign sources, increasing prices, improved processes for separating the rare-earth metals in a pure form not previously attainable, and new and potential uses for the thorium and rare-earth products of monazite.

Monazite is known to occur in many locations in the United States, and several companies are considering recovery of this mineral as a byproduct. The Climax Molybdenum Co., in its 1949 Annual Report to the Stockholders, announced its intention of recovering monazite as a byproduct of its molybdenum operations at Climax, Colo. Rare Earths Development Co., an outgrowth of Rare Earths, Inc., has been formed at McCall, Idaho, to recover monazite sands.[34] Monazite has been recovered from the gold-bearing sands and gravels of the Boise Basin, and the reserves in this area are believed to be large. The University of Idaho, Moscow, Idaho, continued its program of research in the chemical separation of the rare-earths metals in monazite.[35] A report was published summarizing the preliminary investigation of these Idaho placer sands.[36]

It is reported that monazite is almost always present in the pebble phosphate deposits of Florida but always in small amounts and sometimes only in traces.[37] Monazite is also known to occur in the dune and beach sands of Florida and other points along the Atlantic coast, and in the stream gravels of the Appalachian region, where it has been produced in the past.

A discovery of considerable interest as a possible source of the rare earths was announced by the United States Geological Survey. A deposit of bastnaesite has been found in San Bernardino County, Calif. This mineral is a fluocarbonate of the rare earths with thorium and a very small percentage of uranium.[38]

The results of research on the refractory characteristics of the rare-earth sulfides conducted at the University of California, Department of Chemistry and Radiation Laboratory, were reported to the national meeting of the American Chemical Society.[39]

Cerium oxide was placed on the positive list of commodities requiring a validated license for exportation to all Group O and R destinations by the Office of International Trade on June 24.[40]

According to E&MJ Metal and Mineral Markets, monazite was advanced to $245 per metric ton, 65 percent rare-earth oxides including thorium oxide and cerium oxide. However, lower-grade material can be sold at a penalty.

OLIVINE

Shipments of olivine in 1949 declined to 3,528 short tons valued at $56,850 from the 4,766 tons valued at $86,230 in the preceding year.

Considerable interest has been aroused regarding the use of olivine in foundries as a refractory and as a substitute for silica sand. It has been reported that this material does not cause silicosis and can be used in places where dust is created.[41] A recent report states that of the olivine group, forsterite has the most applications in industry. The high melting point and low thermal conductivity make it a satisfactory constituent of refractory materials.[42] Olivine is being produced in Norway and substantial amounts of this material are being exported to England and the United States. Government-owned mines are located in the county of Sunnmore, and the processing plant is at Vanylven, about 30 miles southwest of Aalesund.[43] Recent reports indicate that olivine of suitable quality for industrial purposes has been found in the Haute-Vienne Department of France.[44]

Olivine sold or used by producers in the United States, 1945–49

Year	Short tons	Value	Year	Short tons	Value
1945	(1)	(1)	1948	4,766	$86,230
1946	7,649	$92,868	1949	3,528	56,850
1947	10,838	129,094			

[1] Data not available for publication.

Descriptions of the preparation of phosphate fertilizer, utilizing phosphate rock and olivine, have been discussed in the literature. It is reported that the mixture of two parts of phosphate rock to one part of olivine is fused in an electric furnace at 1,500° to 1,600° C., and that 1 ton of the mixed material yields 0.9 to 0.95 ton of phosphate fertilizer.[45]

Permanente Metals Co., at Permanente, Calif., has been producing a fused calcium-magnesium phosphate fertilizer from serpentine and Idaho phosphate rock. Late in 1949 the name of the company was changed to the Kaiser Aluminum & Chemical Corp.[46]

A report covering thermodynamic data in the series Mg_2SiO_4–Fe_2SiO_4 and $MgSiO_3$–$FeSiO_3$ has been released. Information on analyses and heat-of-solution measurements are included in the paper.[47]

PERLITE

The perlite industry shows signs of growth as production of crude perlite in 1949 reached a record of 59,239 short tons—an increase

of 338 percent above the output in 1948. Sales of expanded perlite amounted to 40,505 short tons valued at $1,975,524.

Twenty-seven companies reported production or sales of perlite in 1949, the majority of which were located in the western part of the United States near the source of crude material. California had seven companies in operation, Nevada six, Utah four, Arizona two, New Mexico two, and Colorado, Illinois, Minnesota, Ohio, Oregon, and Pennsylvania one each. In addition to the above, the following companies reported experimental or developmental output: F. E. Schundler Co., Joliet, Ill.; Midwest Perlite Co., 912 West College Avenue, Appleton, Wis.; Masco Perlite, Inc., 500 Fauna Street, Houston, Tex.; and United States Perlite Co., 609 South Grand Avenue, Los Angeles, Calif.

Production and sales of perlite in the United States, 1946–49

Year	Production, crude (short tons)	Sold or used by producers			
		Crude		Expanded	
		Short tons	Value	Short tons	Value

1947	10,810	6,264	$21,959	(1)	(1)
1948	13,530	(1)	(1)	9,327	$182,277
1949	59,239	41,983	266,055	40,505	1,975,524

1 Bureau of Mines not at liberty to publish figure.

Other items of interest to the industry concern the plans of Great Lakes Carbon Co., New York, to move its crushing and classifier plant from Superior, Ariz., to a location near Socorro, N. Mex.,[48] and plans of the same company to operate a perlite processing plant at Linden, N. J. The daily output is estimated to be 75 tons of lightweight plaster and concrete aggregate.[49] The Western Perlite Corp., Phoenix, Ariz., has purchased the processing facilities of the Perlite Corp., also of Phoenix.[50] A recent report states that a perlite expansion plant is being built at Lordsburg, N. Mex.,[51] and that several companies in the western part of the United States are considering the advisability of establishing expanding plants in the east and furnishing these plants with prepared crude perlite.[52]

The Trilite Corp., Houston, Tex., has installed facilities for the expansion of PerAlex.[53]

In an effort to promote the welfare of the growing perlite industry, a national trade organization was formed during the year. Eighteen companies producing ore or expanded perlite form the membership of the Perlite Institute, with headquarters at 35 West Fifty-third Street, New York 19, N. Y.[54]

Data on modulus of elasticity of perlite concrete and on compressive strength of concrete, using sized and unsized perlite aggregate, have

appeared in the literature [55] as has information on the 3-hour fire tests of steel columns protected with plaster using perlite aggregate. The plaster consisted of 3 cubic feet of perlite aggregate mixed with 100 pounds of fibered gypsum.[56]

United States patent 2,455,666, granted December 7, 1948, covers the design for a horizontal, nonrotating perlite expanding furnace.[57]

Among the many uses for expanded perlite are: Plaster, concrete, pipe covering, loose-fill insulation, furnace insulation, stucco, as a filtering agent, and in the fabrication of blocks, slabs, and roof decks. In 1949, as in 1948, the principal use for perlite was for aggregates in plaster and concrete. The use of perlite as a drilling mud-additive material has been reported.[58]

RADIO-GRADE QUARTZ

Although small quantities of quartz crystal suitable for frequency-control use have been found in the United States, supplies from domestic sources are quite inadequate to supply the market. In 1949, as in the past, the bulk of the supply came from Brazil. Much smaller quantities were imported from Norway, France, India, China, and Hong Kong. Consumption of radio-grade quartz during the year continued to decline. Much of the imported material reported in the accompanying table is of optical and fusing grade and not of radio grade. The excess of imports over consumption is attributable to material rejected after inspection by consumers, stocks, and purchases for the National Stockpile.

Imports of uncut quartz crystal, consumption of radio-grade quartz, and production of piezoelectric units in the United States, 1945–49

Year	Imports of uncut quartz crystal [1]		Consumption of radio-grade quartz (pounds)	Production of piezoelectric units [2] (number)
	Pounds	Value		
1945	1,329,798	$6,190,621	1,040,000	18,918,000
1946	370,556	2,376,598	172,400	1,744,100
1947	473,788	1,815,468	68,100	1,052,400
1948	[3] 1,238,820	[3] 4,209,531	61,600	1,225,400
1949	319,798	1,462,018	46,200	937,100

[1] Includes optical-grade quartz used in production of optical instruments.
[2] Includes oscillators, resonators, and other piezoelectric units.
[3] Revised figure.

During World War II dangerous interruptions to the delivery of Brazilian quartz crystal for use in military communication equipment and later serious concern over possible lack of reserves of natural quartz caused a flurry of interest in substitutes. Soon afterward an active and coordinated program of investigation of possible substitutes for quartz and the synthesis of quartz, under the guidance of the Signal Corps, was under way. Since that time, significant progress has been made. The synthesis of quartz crystal has been technically

[56] Pit and Quarry, vol. 42, No. 4, October 1949, p. 128.
[57] Journal, American Ceramic Society, vol. 32, No. 6, June 1, 1949, p. 149.
[58] Barberii, E. E., Perlite Used as Mud-Additive Material Proves Highly Effective in Tests Combating Lost Circulation: Oil and Gas Jour., vol. 48, July 28, 1949, pp. 280–284.

successful. Good crystals of around 50 grams weight have been grown; 2 pounds of growth have been added to seed material in a small autoclave in less than a month. Continuing investigations involve variations of the temperature and pressure conditions of growth, size and type of autoclave, improvement of equipment and methods for preparing and utilizing the crystal, and basic research in crystal chemistry and physics. The commercial feasibility also is being investigated.

The Signal Corps Laboratories, Fort Monmouth, N. J., developed a method of increasing the frequency-control life of a quartz crystal and preventing "drift" as crystals age. The process involves superheating the crystal and slowly cooling it.[59] Progress made in the synthesis of piezoelectric minerals for frequency control was summarized.[60]

There were reports of the discovery of a deposit of quartz crystal, described as one of the largest in Europe, at Salangsdalen in Bardu, northern Norway. Mapping was begun and Norwegian Mining, Ltd., planned to start operations late in the year.[61]

STRONTIUM MINERALS

No domestic production of strontium minerals was reported during 1949. The Western States have extensive deposits of celestite and strontianite which have been mined during wartime. These deposits occur principally in Arizona, Washington,[62] Texas, and California. The deposit near Ludlow, San Bernardino County, Calif., owned by Rowe, Mullinix & Buehler, was held in stand-by condition in expectation of producing in 1950. Normally, however, celestite is imported from Great Britain, Mexico, and Spain.

The principal peacetime uses for strontium minerals are as fillers and in the manufacture of strontium compounds for use in medicinals, ceramics, lubricants, and pyrotechnics such as signal flares. The chief military use of strontium compounds is in flares and tracer bullets.

Celestite imported for consumption in the United States, by countries, 1947–49, in short tons

[U. S. Department of Commerce]

Country	1947		1948		1949

[60] Waesche, Hugh H., Synthesis of Piezoelectric Minerals for Frequency Control: Paper read before the Geological Society of America (unpublished in 1949).

[61] Chemical Engineering and Mining Review, vol. 41, No. 5, Feb. 10, 1949, p. 196.

[62] Caldwell, Wm. E., and Waterman, G. H., A Northwest Strontium Mineral Deposit: Paper read before Am. Inst. Min. and Met. Eng. meeting at San Francisco, February 1949 (unpublished in 1949).

Low-grade celestite from Texas has been used as a well-drilling mud admix. Strontium metal is discussed in the Minor Metals chapter of this volume.

Trade-journal quotations of prices for celestite, in carlots, 92 percent $SrSO_4$, finely powdered, remained unchanged at $54; crude, 90-percent grade, f. o. b. cars California, remained at $19. Strontianite, per ton lump, in carlots, minimum 84–86 percent $SrCO_3$, remained at $55, nominal.

TOPAZ

The Brewer mine near Kershaw, S. C., was inactive during 1949. A small quantity of float material was shipped by the Carolina Mining & Exploration Corp., Naples, N. C., the only producer of this material.

VERMICULITE

Production.—Sales of cleaned and screened vermiculite reached a record output of 168,819 short tons valued at $1,686,419, representing an increase of 22 percent in quantity and value over the 1948 totals.

Production in 1949 was reported by the following companies: Zonolite Co., 135 South La Salle Street, Chicago, Ill. (mines at Libby, Mont., and Travelers Rest, S. C.); American Vermiculite Co., Spruce Pine, N. C. (mine near Burnsville, N. C.); Franklin Leasehold & Mining Co., Franklin, N. C. (mine at Franklin, N. C.); Vermiculite Supplies, Inc., Sylva, N. C. (mine near Sylva, N. C.); John C. Woody, Route 1, Greenmountain, N. C. (mine near Forbes, N. C.); Girds Creek Vermiculite Products Co., Hamilton, Mont.; Harry Quaintance, Cowdrey, Colo.; and Building Materials, Inc., 617 Majestic Building, Denver, Colo. (mine at Westcliffe, Colo.).

Screened and cleaned vermiculite sold or used by producers in the United States, 1942–49

1942	57,848	$319,931	1946	86,390	$867,973
1943	46,645	471,595	1947	131,385	1,338,572
1944	54,116	541,744	1948	138,635	1,387,233
1945	64,868	648,077	1949	168,819	1,686,419

Reports describing deposits of vermiculite in the United States have been released. One presents data on the Montana deposits, including the notable Libby area, and the other report describes an investigation and testing of deposits in Llano County, Tex.[63] This latter report discusses laboratory test results showing influence of temperature, moisture, and flake size on exfoliation, and beneficiation of vermiculite.

Assuming an average price of $75 per ton for exfoliated material and a 5-percent loss of weight in exfoliating, the total value of exfoliated vermiculite sold in 1949 would be about $12,028,000.

Uses.—Among the many uses for vermiculite are: Insulation,

[63] Perry, E. S., Talc, Graphite, Vermiculite and Asbestos in Montana: Bureau of Mines and Geology, Butte, Mont.: Memoir 27, 1948, 44 pp. McMillan, W. D., and Gerhardt, A. W., Investigation and Laboratory Testing of Vermiculite Deposits, Llano County, Tex.: Bureau of Mines, Rept. of Investigations 4486, 1949, 42 pp.

soundproofing, aggregate for plaster and concrete, boiler insulation, pipe covering, soil amendments, oilless bearings, foundry work, blocks, brick, wallboard, stucco, rubber goods, etc.

Pyrok, a new surfacing material, is a mixture of portland cement, lime, expanded vermiculite, and water. It is reported that this mixture, applied like plaster to wood, steel, and brick work, is water proof and fire and frost resistant and does not crack.[64] A recent article shows how to prepare vermiculite acoustical plaster and gives the amounts of materials needed for plaster : vermiculite aggregate mixes ranging from 1 : 1½ through 1 : 4.[65]

The results of fire tests on a steel column protected with vermiculite plaster have been released. Columns were covered with both 1- and 1½-inch thicknesses of plaster on metal lath and were tested to critical temperatures in 3 hours and 32 minutes and 4 hours and 42 minutes, respectively. The Underwriters' Laboratories have issued official fire ratings of 3 hours and 4 hours for 1-inch and 1½-inch thicknesses, respectively.[66] Experiments with the use of vermiculite in foundry work have been discussed in the literature,[67] and United States patent 2,942,208, covering a process of exfoliating and bleaching vermiculite, has been released.[68]

Prices.—Domestic screened and cleaned vermiculite in 1949 averaged $9.99 per short ton f. o. b. mines, while quotations for South African crude were $28 to $30 per ton, f. o. b. Atlantic ports. The exfoliated material was worth about $75 a ton in 1949.

Africa.—Interest in vermiculite in foreign countries persists. Production of this mineral in the Transvaal has slumped slightly due to poor roads, reconditioning of plants, and the shortage of bags. Vermiculite, however, is still much in demand and it is reported that all three companies operating in the Palabora district are taking steps to increase production.[69]

It is reported that specifications are being prepared for vermiculite and its products for submission to the South African Bureau of Standards. This procedure will promote standardization of quality throughout the Union and provide for continuous supplies of vermiculite of specific quality.[70]

Vermiculite has been known to exist in Southern Rhodesia for some time. The Shawa Syndicate operates a claim in the Sabi Valley and preliminary reports indicate the material to be of good quality.[71] First exports in the amount of 300 tons were expected to begin in August, from Sabi Vermiculite, Ltd.[72] Areas of important vermiculite deposits in Rhodesia are found in the Dorowa-Shawa district, 42 miles west of Odzi, and on the Victoria Falls road, about 17 miles on the Wankie side of the Gwaai River bridge. Samples sent to the Imperial Institute for testing proved to be clean and high-grade vermiculite.[73]

India.—A consular report by Howard Donovan, Counselor of American Embassy, Delhi, India, November 9, 1949, lists the principal areas of vermiculite in the State of Mysore as follows:

Bageshpura: Chemical analysis of vermiculite shows silica 38.10 percent, alumina 17.24, ferric iron 8.24, FeO 1.32, magnesia 15.49, and water 17.12.

Channarayapatna: Vermiculite is shown in prospect pits to extend to over 20 feet. Chemical analysis shows silica 36.06 percent, alumina 20.48, ferric iron 15.91, FeO 3.12, lime 3.54, magnesia 12.95, potassa 0.12, titania 0.64, and water 7.82.

Chunchankatte: Vermiculite is bronze-yellow to dark green in color. No prospecting done yet.

Midavanda: Thin occurrences of vermiculite at contact of kaolinized gneisses.

Pavagada: The first Mysore vermiculite was noted here, but prospecting has not yet begun.

Proper development of these areas will make India self-sufficient and will permit export of vermiculite.

WOLLASTONITE

The Willsboro Mining Co., Inc., produced 500 short tons of wollastonite from the Bristol Mountain open-pit operation (formerly the Burnham property) near Willsboro, N. Y. This material was valued at $14 per ton f. o. b. the shipping point at Willsboro and was sold for use in ceramics and as a chemical raw material.

PART III. STATE REVIEWS

The Mineral Industry of Alaska

By Alfred L. Ransome

GENERAL SUMMARY

DESPITE a decline for the second consecutive year, gold continued to rank first in value among mineral commodities. Notwithstanding this decrease, the total value of mineral output in the Territory rose to $15,302,000 in 1949 compared to $13,024,000 in 1948.

Mineral production of Alaska, 1947–49

Mineral	1947		1948		1949	
	Quantity	Value [1]	Quantity	Value [1]	Quantity	Value [1]
Antimony ore .... short tons	40	$16,056	68	$29,336	74	$31,356

[1] The values for antimony, copper, gold, lead, mercury, silver, and zinc in this table continue to be calculated on the basis of unit prices of the smelted metals at the smelter or principal market and are therefore higher than corresponding estimates, in the Statistical Summary chapter, of the value of the ores and concentrates.

[2] Bureau of Mines not at liberty to publish separately; value included with "Miscellaneous."

[3] Comprises value of clay (1948), pumice (1947–48), sand and gravel, and items indicated by footnote 2.

Coal ranked second to gold in value of output, but although production was even greater than the former record in 1948, a lower unit price resulted in the value being only a little above that for the previous year. Platinum mining continued to be an important factor in the mineral industry, with production of crude platinum-group metals exceeding that of 1948. The output of lead was only one-sixth of the 1948 production, and silver, copper, and zinc—each a byproduct from an operation conducted primarily for another metal—was one-half, one-fourth, and one-tenth, respectively, of the 1948 production.

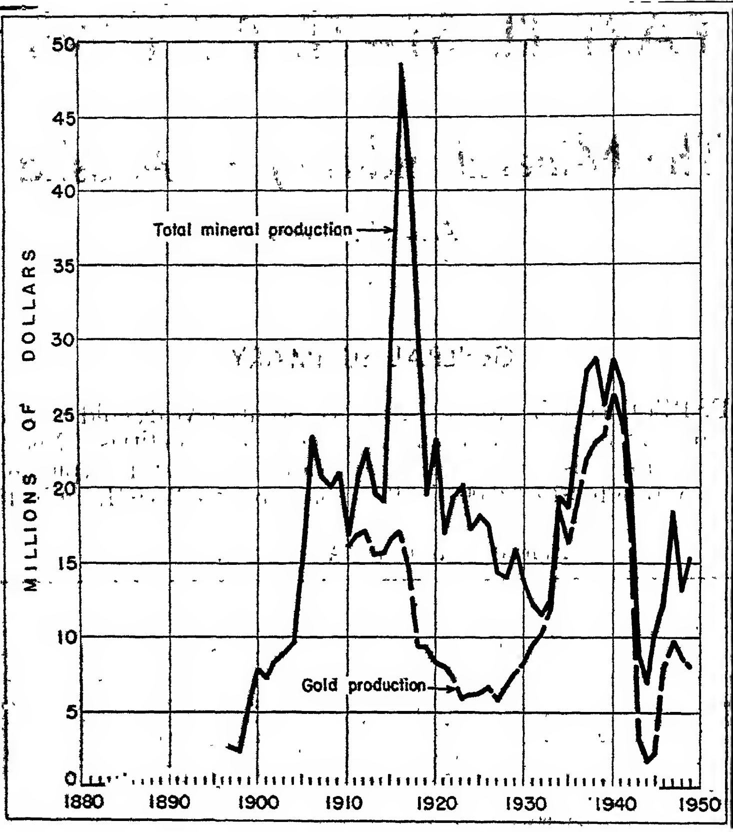

FIGURE 1.—Trends in value of total mineral production (1880–1949) and gold production (1910–49) in Alaska. From 1911 to 1931 copper production accounted for most of the value of minerals other than gold.

The output of tin was small, but substantially above that in the previous year.

Gold mining, which has maintained its position as the backbone of the mining industry in Alaska, has had ever-increasing difficulty in balancing high costs of mining, labor, and supplies against an established price for its product—the United States Treasury price of gold—which has remained unchanged since 1934. Although the supply of labor in 1949 was better than at any time since the war, the narrowing margin between high operating costs and the $35 per fine ounce official price for gold was not conducive to operation of any but the more efficient enterprises. "Natural" or unprocessed gold continued to be legally sold on the open market by a number of operators, at prices varying from $3 to $8 over the official price.

Lode mining in the Territory continued to remain virtually at a standstill; and, with the exception of coal, limestone, and sand and gravel, nonmetalliferous activity was negligible.

GOLD, SILVER, COPPER, LEAD, AND ZINC

The accompanying tables show the mine production of gold, silver, copper, lead, and zinc in Alaska, 1945–49 and 1880–1949, in terms of recoverable metals; the gold production at placer mines, by classes of mines and methods of recovery; mine production of gold, silver, copper, lead, and zinc, by regions; and ore and old tailings sold or treated and various metallurgical compilations based on output in 1949.

A small proportion of the output shown in the tables following was mined before 1949 but not shipped or sold until that year.

All tonnage figures are short tons and "dry weight"; that is, they do not include moisture.

Yardage figures used in measuring material treated in placer operations are "bank measure"; that is, the material is measured in the ground before treatment.

The value of gold, silver, copper, lead, and zinc production reported herein has been calculated at the following prices.

Prices of gold, silver, copper, lead, and zinc, 1945–49

Year	Gold [1] (per fine ounce)	Silver [2] (per fine ounce)	Copper [3] (per pound)	Lead [3] (per pound)	Zinc [3] (per pound)
1945	$35.00	$0.711+	$0.135	$0.086	$0.115
1946	35.00	.808	.162	.109	.122
1947	35.00	.905	.210	.144	.121
1948	35.00	.905+	.217	.179	.133
1949	35.00	.905+	.197	.158	.124

[1] Price under authority of Gold Reserve Act of Jan. 31, 1934. Treasury legal coinage value of gold from Jan. 18, 1837, to Jan. 31, 1934, was $20.67+ ($20.671835) per fine ounce.

[2] Treasury buying price for newly mined silver. 1945 to June 30, 1946: $0.71111111; July 1, 1946, to Dec. 31, 1947: $0.905; 1948–49: $0.9050505.

[3] Yearly average weighted price of all grades of primary metal sold by producers. Price in 1945–47 includes bonus payments by Office of Metals Reserve for overquota production.

Gold.—The recorded production of gold in Alaska in 1949 was 8 percent below the output in 1948. Only a few new operators have entered the field of gold mining, less than the number of previously established operators who either did not mine or sharply curtailed operations during 1949. One major exception was resumption of activity by the Alaska-Pacific Consolidated Mining Co. at its Independence lode-gold mine, Willow Creek district, Cook Inlet-Susitna region, for the first time since 1946. The sale of unprocessed or natural gold by a number of operators who hoped to gain by open market transactions at prices exceeding $35 per fine ounce apparently was greater in volume than in 1948. However, although some undoubtedly did benefit, others reported that the cost of handling such transactions (including assaying charges, interest on capital invested in the form of unsold gold, and transportation and insurance charges) was high enough, more or less, to offset any advantage gained by a higher price and that over-all results of natural gold sales during 1949 were disappointing. Nevertheless, 22 producers indicated that natural gold produced in 1949 had been sold for a price exceeding $35

per fine ounce. The recorded production for 1949 includes 9,836 fine ounces of gold and 88 fine ounces of silver contained in natural gold sold on the open market by 10 producers. In addition, 8,656 ounces of natural gold bullion were reported sold by 12 producers on the open market for prices equivalent to $35 or more per fine ounce of gold contained therein; information on fineness was inadequate for calculating the recoverable gold and silver content for inclusion with the 1949 statistical record. Available information indicated that an undetermined quantity of natural gold (estimated to be 5,000 ounces) was sold by 11 producers who did not report specifically, and 1,022 ounces of natural gold from 2 properties was reported produced but not sold. Specific and accurate data regarding natural gold sales are not readily available, and the afore-mentioned figures giving the number of operators and quantities involved are incomplete. However, from these data it can be assumed that approximately 22,000 ounces of natural gold bullion originating from Alaskan mines in 1949 were sold. A comparable total of 18,000 ounces was estimated sold in 1948.

Mine production of gold, silver, copper, lead, and zinc in Alaska, 1945–49, and total, 1880–1949, in terms of recoverable metals

Year	Mines producing [1]		Ore, old tailings, etc. (short tons)	Gold (lode and placer)		Silver (lode and placer)	
	Lode	Placer		Fine ounces	Value	Fine ounces	Value
1945	18	143	6,512	68,117	$2,384,095	9,983	$7,099
1946	16	256	10,798	226,781	7,937,335	41,793	33,769
1947	19	200	13,891	279,988	9,799,580	66,150	59,866
1948	24	274	6,014	248,395	8,693,825	67,341	60,947
1949	18	222	78,839	229,416	8,029,560	36,056	32,633
1880–1949	----------	----------	(2)	26,841,227	652,457,547	19,959,845	14,235,037

Year	Copper		Lead		Zinc		Total value
	Short tons	Value	Short tons	Value	Short tons	Value	
1945	5	$1,350	11	$1,892	----------	----------	$2,394,436
1946	2	648	115	25,070	----------	----------	7,996,822
1947	12	5,040	264	76,032	25	$6,050	9,946,568
1948	16	6,944	329	117,782	22	5,852	8,885,350
1949	4	1,576	51	16,116	2	496	8,080,381
1880–1949	685,698	226,577,424	25,570	2,984,563	49	12,398	896,266,969

[1] Excludes itinerant prospectors, snipers, high-graders, and others who gave no evidence of legal right to property.
[2] Figure not available.

The unusual seasonal limitations to mining activity in Alaska are indicated by the production of gold in 1949 by months, as shown in an accompanying table. The data are based on mint and smelter receipts which have been adjusted to exclude those receipts during the first 4 months which actually reflect production in 1948 and to include similar receipts during the same period in 1950 that reflect output in 1949. Nevertheless, production was probably considerably less than that shown during the last 3 months of the year, but cor-

respondingly higher for the period May through September, which represents the season for active mining in the Territory between the spring break-up or thaw and the fall freeze. The principal reason for the relatively high receipts at mints and smelters during the last quarter is that numerous operators make their gold "clean-up" only once or twice during the active mining season, the result being that a substantial quantity of gold accumulated in the sluices over a period of several months is not recovered until late fall.

The 15 leading gold-producing mines (14 placer and 1 lode) in Alaska in 1949, listed in the accompanying table, yielded 73 percent of the total recorded gold output of the Territory; the 5 leading producers supplied 57 percent. The Fairbanks district in the Yukon River Basin region, and the Nome district in the Seward Peninsula region ranked first and second, respectively, in gold production in the Territory owing to the bucket-line dredging operations of the United States Smelting, Refining & Mining Co.

Active lode-gold mining was limited to a few relatively small scale operations, with the exception of the Independence mine, Willow Creek district, Cook Inlet-Susitna region. The greatest proportion of gold recovered from lode operations came from active mines in the Willow Creek district, but a substantial quantity was from mill cleanups at mines that were inoperative during 1949.

Fifteen leading gold-producing mines in Alaska in 1949, in order of output [1]

Rank	Mine	District	Region	Rank in 1948	Operator	Source of gold

[1] Includes all placer operations using power excavator and washing plant, both on dry land; when washing plant is movable, outfit is termed "dry-land dredge."

[2] Excludes itinerant prospectors, snipers, high-graders, and others who gave no evidence of legal right to property.

Silver.—Of the silver produced in Alaska in 1949, 90 percent was a byproduct of gold mining (55 percent in 1948) and 10 percent came from lead ore. The most important producer of silver in Alaska in 1949 was the United States Smelting, Refining & Mining Co. (Fairbanks department), which recovered silver as a byproduct of bucket-line dredging operations in the Fairbanks district. The J. H. Scott Co., which dropped from first place in 1948 to second in 1949, recovered silver as a byproduct from lead ore produced from the Riverside mine in the Hyder district, Southeastern Alaska region.

Copper, Lead, and Zinc.—Production of the base metals (copper, lead, and zinc) was limited almost entirely to output from one mine, the Riverside, near Hyder in Southeastern Alaska. A relatively small output of the metals came from several other properties in the same region as a byproduct recovery from ore and old tailings treated primarily for the recovery of gold.

Mine production of gold, silver, copper, lead, and zinc in Alaska in 1949, by months, in terms of recoverable metals [1]

Month	Gold (fine ounces)	Silver (fine ounces)	Copper (short tons)	Lead (short tons)	Zinc (short tons)
January					
February	19	7			
March	30	4			
April	654	300			
May	10,302	1,488		2	(2)

1948	24	274	5,593	242,802	248,395	67,341	[4] 8,885,350

[1] Excludes itinerant prospectors, snipers, high-graders, and others who gave no evidence of legal right to property.
[2] Combined to avoid disclosure of individual output.
[3] Includes value of 4 short tons of copper ($1,576), 51 tons of lead ($16,116), and 2 tons of zinc ($496).
[4] Includes value of 16 short tons of copper ($6,944), 329 tons of lead ($217,782), and 22 tons of zinc ($5,582).

MINING INDUSTRY

Two fewer bucket-line dredges (28 in 1949 compared with 30 in 1948) washed 79 percent of the total gravel mined for gold in Alaska in 1949 and recovered 71 percent of the total placer gold and 68 percent of the total Alaska gold (lode and placer). No dragline dredges (which include all operations using a floating washing plant and a dragline excavator) were reported in operation during 1949. Placer operations using combinations of bulldozer and hydraulic methods—in many cases supplemented with dragline equipment—are becoming more numerous in the Territory because of the distinct advantage of relatively low initial cost of equipment in proportion to the small labor crews necessary and the large volume of material that can be handled. In general, the mining method is to bulldoze the gold-bearing material to bedrock sluice boxes and use hydraulic giants (usually in closed circuit with a settling pond downstream below the sluice box, and a pump for return of the water). Dragline equipment—when used—is generally utilized for disposing of tailings and in some cases for transporting gravel to elevated sluice boxes or washing plants. Occasionally draglines or bulldozers are used for removing overburden, but by far the greater proportion of the overburden, in the form of frozen muck, is washed off with hydraulic giants. Combination methods of this type, in which the gravel is moved mechanically to the washing plant or sluice box (classified as nonfloating washing plants), washed 19 percent of the total gravel mined and recovered 27 percent of the placer gold, a 19-percent decrease in gravel handled and a 2-percent gain in gold recovered compared with 1948. Operations in which gold was recovered primarily by hydraulic methods (excluding hydraulic stripping of overburden) showed a decrease in the number of mines (partly because of reclassification from hydraulic to nonfloating washing plants), gravel washed, and gold produced. Gold output from a smaller number of small-scale hand operations was correspondingly less than in 1948. Two drift mines produced only a few ounces of gold in 1949; this method of mining, once widespread in Alaska, is now virtually obsolete. The total yardage of gravel washed at gold placer mines increased 10 percent, whereas gold recovered declined 9 percent. The average recoverable gold content of gravel decreased 17 percent.

The tonnage of material from lode mines (gold, silver, copper, lead, and zinc) in Alaska treated in 1949 apparently increased to 13 times the total for 1948. However, this marked increase is due largely to inclusion of a large tonnage of old tailings, for which comparable figures for 1948 are not available, although a substantial tonnage of similar material was known to have been treated in that year. The output of lode gold increased 49 percent, largely because of resumption of operations of the Independence mine, Willow Creek district, Cook Inlet-Susitna region; however, gold from all active lode mines and mill clean-ups at inactive mines comprised only 4 percent of the Territory total.

ORE CLASSIFICATION

Of the 78,839 tons of ore (including 70,026 tons of old tailings) sold or treated in 1949, 97 percent was gold ore and the remainder lead ore. Details of ore classification are given in the Gold and Silver chapter of this volume.

Ore and old tailings sold or treated in Alaska in 1949, with content in terms of recoverable metals

Source	Material sold or treated		Gold (fine ounces)	Silver (fine ounces)	Copper (pounds)	Lead (pounds)	Zinc (pounds)
	Ore (short tons)	Old tailings (short tons)					
Dry gold ore	6,713	70,026	7,983	1,372	100	600	200
Lead ore	2,100		344	3,739	7,900	101,400	3,800
Total lode mines	8,813	70,026	8,327	5,111	8,000	102,000	4,000
Placers			221,089	30,945			
Total: 1949	8,813	70,026	229,416	36,056	8,000	102,000	4,000
1948	[1] 5,848	166	248,395	67,341	32,000	658,000	44,000

[1] Includes 80 tons of ore produced before 1948.

METALLURGIC INDUSTRY

Of the total ore and old tailings handled during 1949, all was treated at mills (with or without concentrating equipment) except a small tonnage shipped for direct smelting; 97 percent was treated by amalgamation. Smelters in the United States received 340 tons of flotation concentrates, 46 tons of gravity concentrates, and 14 tons of ore for direct smelting from Alaska operations of mines producing gold and lead (with silver, copper, and zinc as byproducts).

Mine production of metals in Alaska in 1949, by methods of recovery, in terms of recoverable metals

Method of recovery	Gold (fine ounces)	Silver (fine ounces)	Copper (pounds)	Lead (pounds)	Zinc (pounds)
Ore and old tailings amalgamated	7,131	851			
Concentrates smelted:					
Flotation	878	3,832	7,900	101,400	3,800
Gravity	252	313	100	600	200
Ore smelted	66	115			
Total lode mines	8,327	5,111	8,000	102,000	4,000

REVIEW BY REGIONS AND DISTRICTS

There is no official record for a considerable quantity of natural gold produced in Alaska in 1949 and sold on the open market for prices over $35 a fine ounce, inasmuch as some producers did not submit reports and the purchasers are holding such gold on speculation. The recorded production of gold from a few of the districts in 1949 (including the Fairbanks, Fortymile, Circle, Eagle, Kantishna, Innoko, Rampart, and Tolovana districts in the Yukon River Basin region, and the Council-Bluff district in the Seward Peninsula region, from which natural gold was reported as having been sold) is probably lower than the actual output by several hundred to several thousand ounces, and there is some question as to the relative rank in production of the individual operators.

Mine production of gold, silver, copper, lead, and zinc in Alaska in 1949, by regions and districts, in terms of recoverable metals [1]

[1] Only those districts shown separately for which Bureau of Mines is at liberty to publish figures; others producing listed in footnote 7 and their output included with "Other districts."
[2] Excludes itinerant prospectors, snipers, high-graders, and others who gave no evidence of legal right to property.
[3] Sources of total silver as follows: 5,111 ounces from lode mines, and 30,945 from placers.
[4] Included with "Other districts."
[5] Exclusive of placer output, which is included with "Other districts."
[6] Gold not sold.
[7] Includes following: Willow Creek (placer) Cook Inlet-Susitna region; Chistochina and Nelchina (placer) Copper River region; Kiana (placer) Northwestern Alaska region; Koyuk (placer) Seward Peninsula region; Ketchikan (lode) Southeastern Alaska region; Hughes, Kaiyuh (placer) Yukon River Basin region.

COOK INLET-SUSITNA REGION

Willow Creek District.—The Alaska Pacific Consolidated Mining Co. reopened the Independence mine on Fishhook Creek near Wasilla late in the season after being inactive since 1946. The mine was operated on a leasing system, the ore being treated at the company 80-ton amalgamation-flotation mill on the property. From 4,366 tons of gold ore milled from August 18 to December 31, 3,018 ounces of gold and 179 ounces of silver were recovered as bullion by amalgamation; in addition, 42 tons of concentrate (containing 333 ounces of gold, 31 ounces of silver, and 199 pounds of copper) were produced and shipped to a smelter in the United States. The Fern Exploration Co., Inc., operated the Fern mine on Archangel Creek throughout the year; 800 tons of gold ore were treated in a 50-ton amalgamation-flotation mill to recover 1,381 ounces of gold and 63 ounces of silver as bullion and an additional 80 ounces of gold and 6 ounces of silver contained in 11 tons of concentrate shipped to a smelter in the United States. Lloyd Hill recovered a small quantity of gold from gold ore treated by amalgamation at the Lonesome mine (Gold Mint property) on the Little Susitna River. A small quantity of gold was recovered as the result of clean-up operations at the Gold Cord mill on Fishhook Creek. Development work continued throughout 1949 at the Snowbird mine on Reed Creek. A 30-ton mill and power plant were constructed during the year, but no ore had been treated by December 31.

Yentna-Cache Creek District.—Again, as in 1948, the largest producer in the district was Collinsville Mines (dryland dredge with dragline equipment) operating on Twin Creek. The Alaska Exploration and Mining Co. hydraulicked 15,000 cubic yards of gravel on Bird Creek from May 1 to October 6 and recovered 245 ounces of gold and 36 ounces of silver. Harold Stanton recovered a moderate quantity of gold by the combination bulldozer-hydraulic method on Nugget Creek from May 28 to September 5; the ground, under lease from the Nugget Creek Mining Co., was reportedly worked out at the end of the season. A few other operators recovered lesser quantities of gold by hydraulicking and the widely used bulldozer-hydraulic combination.

COPPER RIVER REGION

Chistochina District.—Activity in the district was virtually at a standstill in 1949. Hagarty and Beerman operated the Big Four mine on Big Four Creek from June 22 to August 31 and recovered a small quantity of gold by the bulldozer-hydraulic method. The Slate Creek Gold Placers, the largest producer in the district in 1948, did not operate during the 1949 season.

Nelchina District.—C. J. McMahan was the only operator reported active in the district in 1949; he recovered a small quantity of gold from North and Albert Creeks, using a carry-all-bulldozer combination to move gravel to the sluice box.

KENAI PENINSULA REGION

Moose Pass-Hope District.—The Skeen-Lechner (Falls Creek) mine was operated by the Falls Creek Mining Co. from July 1 to October 15,

1949; 110 tons of gold ore were treated in the 25-ton amalgamation flotation plant at the mine and 98 ounces of gold and 27 ounces of silver were recovered in the form of bullion. In addition, less than one-half ton of concentrate containing 22 ounces of gold and 6 ounces of silver was shipped to a smelter in the United States. William Kelly operated the Grant Lake mine during the season and recovered a small quantity of gold from gold ore treated by amalgamation.

KUSKOKWIM REGION

Goodnews Bay District.—The only gold produced in the district in 1949 was recovered as a byproduct from platinum mined by the Goodnews Bay Mining Co. on the Salmon River.

Tuluksak-Aniak District.—The New York-Alaska Gold Dredging Corp., the largest gold producer in the region and the third largest in the Territory in 1949, operated two floating bucket-line dredges (electrically powered, equipped with sixty-seven 6½-cubic-foot and sixty-six 1½-cubic-foot buckets, respectively) and a dragline-bulldozer combination with a nonfloating washing plant on the Tuluksak River and Bear and California Creeks. The Marvel Creek Mining Co., using a dragline-bulldozer-hydraulic combination with nonfloating washing plant on Marvel Creek from June 1 to October 15, washed 100,000 cubic yards of gravel to recover 1,133 ounces of gold and 144 ounces of silver. Using a bulldozer-hydraulic combination with a nonfloating washing plant, the Canyon Creek Mining Co. (Jens Kvamme & Sons) recovered a substantial quantity of gold from Canyon Creek from July 1 to September 5.

NORTHWESTERN ALASKA REGION

Kiana District.—The Lammers Exploration Co., the only gold producer in the district in 1949, operated its Diesel-electric bucket-line dredge (with fifty-six 3-cubic-foot buckets) on Klery Creek during the 1949 season.

SEWARD PENINSULA REGION

In the Seward Peninsula region, 14 floating bucket-line dredges were in operation during 1949 (the same number as in 1948); in addition, numerous operators used hydraulic giants, bulldozers, and dragline excavators either separately or in combination. There was no reported production from any lode gold mine.

Council-Bluff District.—The principal producers in the district were the Alaska Placer Co., which operated a bucket-line dredge (flume type, equipped with sixty 3-cubic-foot buckets) on the Niukluk River benches (2,101 ounces of gold and 239 ounces of silver were recovered from 250,000 yards of gravel washed during the period from June 12 to October 5), and the Sourdough Dredging Co., which operated a bucket-line dredge equipped with sixty-two 3½-cubic-foot buckets on Dutch and Ophir Creeks July through October 1949. The Council Dredging Co. operated a bucket-line dredge on Ophir Creek during the 1949 season—the first appearance of this company among the producers in the district since the war. C. L. Dempsey recovered a small quantity of gold from Willow Creek, using a bucket-line dredge.

Among other operators in the district using different methods, the Niukluk Mining Co. was the principal producer of placer gold.

Fairhaven District.—The Havenstrite Mining Co. (formerly known as Arctic Circle Exploration Co.), operating two drag-line excavators (each with 1½-cubic-yard buckets) for the movement of tailings and three bulldozers for delivering gravel to the sluice box on Candle Creek, recovered 4,255 ounces of gold and 591 ounces of silver from 90,162 cubic yards of material washed between April 20 to November 6. The operation ranked first in production of gold in the district and seventh in the Territory. Neither of the two bucket-line dredges formerly owned by the predecessor company was operated in 1949. The Casa de Paga Gold Co. operated its two bucket-line dredges on the Inmachuk River from May 1 to October 30 and recovered 3,700 ounces of gold and 388 ounces of silver from 365,410 cubic yards of gravel. Both dredges are the flume type, equipped with seventy 3-cubic-foot buckets. Other producers of a moderate quantity of gold from placers worked hydraulically and in combination with bulldozers, pumps, or other types of mechanical equipment included N. B. Tweet & Sons (bulldozer-hydraulic on Humboldt Creek); Wallace Porter (bulldozer-hydraulic on claim 3 below Discovery on Bear Creek; 374 ounces of gold and 34 ounces of silver recovered from 30,000 cubic yards); Jump Creek Mines (Fred Weinard, hydraulic on Jump Creek); and Anderson & Luoto on Old Glory Creek (99 ounces of gold and 10 ounces of silver recovered from 7,200 cubic yards of gravel handled by a bulldozer-hydraulic combination).

Kougarok District.—Kougarok Consolidated Placers, Inc., operating its Diesel-powered dredge (with seventy-six 2¼-cubic-foot buckets) on claims 29, 30, and 31 above Allen's Discovery, Kougarok River, from July 15 to October 18, was the largest producer of gold in the district in 1949. The North Fork Dredging Co. operated its bucket-line dredge (with 2½-cubic-foot buckets) on Harris Creek during the season and recovered a substantial quantity of gold. Other mining in the district in 1949 was limited to placer operations, principally by hydraulicking and with combinations of mechanical equipment using nonfloating washing plants (in most cases bedrock sluice boxes). The large operators were Grant Mining Co. (hydraulic on Coffee Creek); Trinity Mining Co. (John Kanari and Al Carey—bulldozer on Kougarok River), Noonan & Whitmore (bulldozer-hydraulic with elevated sluice box on Mascot Gulch) on the M. J. Walsh property, Atlas Mines (Geo. J. Waldhelm—dragline-bulldozer-hydraulic on Atlas Creek), Nashenweng & Asp (hydraulic-bulldozer on claim 8, Quartz Creek), Silver Bow Mining Co. on Coffee Creek, and Wirum Bros. also on Coffee Creek (hydraulic on claim 4 above Crause's Discovery).

Koyuk District.—James E. Baldwin recovered a substantial quantity of gold from the Right Fork Sweepstake Creek during the period July 1 to October 3, using bulldozer-hydraulic equipment. The bucket-line dredge of the Ungalik Syndicate did not operate during the 1949 season.

Nome District.—The United States Smelting, Refining & Mining Co., operating two of its fleet of four bucket-line dredges in the vicinity of Nome from May 27 to December 3, was the largest producer of

gold in the district and the Seward Peninsula region and ranked second in the Territory. The two dredges in operation were electrically powered and equipped with 134 and 109 9-cubic-foot buckets, respectively. Lee Bros. Dredging Co., the second-largest gold producer in the district in 1949, operated two bucket-line dredges (equipped with seventy-three 5-cubic-foot and sixty-six 3½-cubic-foot buckets) on the Solomon River during the 1949 season. The two other bucket-line dredges active in the district during 1949 were operated by Gold Beach Dredging Co. (Childberg claim, Nome Beach) and Tolbert Scott & Son (Iron Creek). Among the larger producers of 100 ounces or more of gold from placers worked by hydraulic giants and in combination with bulldozers and pumping equipment were E. W. Quigley on Solomon River (hydraulic), Andrew Peterson on Iron Creek, Kougarok Freighting & Mining Co. on Buster Creek (bulldozer-hydraulic), and Rocky Mountain Mining Co. on Rocky Mountain Creek (bulldozer-hydraulic).

Port Clarence District.—O'Leary & Co. hydraulicked on the Bluestone River during the 1949 season and recovered a small quantity of gold, using equipment obtained from the Glacier Creek Mines (which had operated on Glacier Creek, Nome District, in 1948). Frank L. Rice used hydraulic-bulldozer equipment on Sunset Creek to recover a moderate quantity of gold during a 50-day operating period.

Serpentine River District.—George Bodis worked the Dick Creek Placers (No. 12 above Discovery) from July 1 to October 1. Using a bulldozer-hydraulic combination with a bed-rock flume, 69 ounces of gold and 7 ounces of silver were recovered from 3,000 cubic yards of gravel.

SOUTHEASTERN ALASKA REGION

One-third of the total Alaska lode-gold output came from seven operations in the Hyder, Juneau, and Ketchikan districts. Nearly all of the lode silver and all of the copper, lead, and zinc came from this region. Placer mining was virtually nonexistent during 1949, as in 1948.

Hyder District.—The J. H. Scott Co. operated the Riverside mine on a reduced scale from August 15 to December 1 treating lead ore (containing scheelite) in its 100-ton combination flotation-gravity concentration mill. From 2,100 tons of lead ore milled, 265 tons of lead concentrate (containing 151 ounces of gold, 3,500 ounces of silver, 8,335 pounds of copper, 99,441 pounds of lead, and 4,494 pounds of zinc) were produced and shipped to smelters in the United States.

Juneau District.—The Alaska Juneau mine remained inactive during 1949, but a few tons of lead concentrate containing some gold and silver obtained as the result of mill clean-up was shipped to a smelter in the United States. Howard Hayes & Stan Whitely recovered 1,581 ounces of gold and 301 ounces of silver in the form of bullion by retreating 65,500 tons of old tailings from the Alaska Juneau mill by amalgamation; in addition, 29 tons of gravity concentrate containing 146 ounces of gold, 74 ounces of silver, 137 pounds of copper, and 995 pounds of lead were shipped to a smelter in the United States. The same partners similarly recovered 115 ounces of gold and 12 ounces of silver from 4,500 tons of old tailings from the Treadwell mill. The

LeRoy Mining Co. operated the LeRoy (Rainbow) mine on Glacier Bay from April 1 to October 24 and treated gold ore in an 18-ton amalgamation-flotation mill; from 75 tons of ore and 26 tons of old tailings milled, 324 ounces of gold and 143 ounces of silver were recovered as mill bullion, and 3 tons of concentrate were produced (containing 67 ounces of gold, 49 ounces of silver, 4 pounds of copper, 34 pounds of lead, and 271 pounds of zinc) and shipped to a smelter in the United States.

Ketchikan District.—The only active gold mine in the district in 1949 was the Dawson mine on Prince of Wales Island, operated by Wendell Dawson from March 7 to November 12; gold ore was treated by amalgamation, and a small tonnage of ore and concentrate was shipped to a smelter in the United States.

YUKON RIVER BASIN REGION

One hundred and thirty-three placer mines and 3 lode mines in 17 districts in the Yukon River Basin region accounted for 66 percent of the total Alaskan gold produced in 1949. Sixty-nine percent of the 151,055 ounces of placer gold produced in the region came from 10 bucket-line dredges. Two percent of the total Alaska gold from lode mines came from the region. The Fairbanks district continued to be the most important gold-producing area in the region and the Territory.

Circle District.—Two bucket-line dredges were active in the district in 1949. Alluvial Golds, Inc., operated its Diesel-powered dredge equipped with seventy-two 4½-cubic-foot buckets on Woodchopper Creek from April 16 to October 11. The C. J. Berry Dredging Co., operating its dredge on Mammoth Creek, washed 352,500 cubic yards of gravel to recover 3,920 ounces of gold and 787 ounces of silver. Gold Placers, Inc., did not operate its dredge on Coal Creek during 1949; the season was spent in stripping overburden preparatory to resumption of production in 1950. The output from the two active dredges constituted the greater part of the production from the district, which ranked second in gold production in the Yukon River Basin region. The larger producers of placer gold in the district by other methods were P. R. & H. Mining Co., on lower Deadwood Creek (1,559 ounces of gold and 381 ounces of silver recovered from 110,000 cubic yards of material handled by the bulldozer-sluice box method); Deadwood Mining Co., on upper Deadwood Creek (490 ounces of gold and 74 ounces of silver recovered from 20,000 cubic yards of gravel by the combination dragline-bulldozer-hydraulic method); Kelly & Wilkinson, on Miller Creek (481 ounces of gold and 87 ounces of silver from 45,000 cubic yards of material handled; bulldozer-hydraulic); Frasca & Gibson, on Eagle Creek (bulldozer-hydraulic); Harrison Creek Mining Co., on Harrison Creek (hydraulic); and A. A. Zimmerman, on Independence Creek (hydraulic).

Eagle District.—The Yukon Placer Mining Co., using bulldozer equipment, worked placer ground on Fourth of July Creek from April 15 to September 30 and recovered 1,372 ounces of gold and some silver from 70,000 cubic yards of gravel. Burnett F. Hansen, using similar equipment, operated on Alder Creek. The Crooked Creek

Placer Co. (Bauer & Celich) hydraulicked on Crooked Creek from April 15 to September 30 and recovered 80 ounces of gold and 6 ounces of silver from 2,700 cubic yards of gold-bearing gravel washed.

Fairbanks District.—The United States Smelting, Refining & Mining Co., operating five bucket-line dredges in the Fairbanks district, was—as in previous years—by far the largest producer of gold, not only in the district but in the Territory. The company operated three 6-cubic-foot Bethlehem dredges (1 with 68 buckets and 2 with 78 buckets each), one 10-cubic-foot Bethlehem dredge (with 93 buckets), and one 10-cubic-foot Yuba dredge (with 106 buckets); all dredges are operated electrically. Other equipment used (chiefly for removing overburden) included 240 Joshua Hendy hydraulic giants, a Bucyrus 10–W power shovel, and numerous bulldozers and carryalls.

The Brinker-Johnson Co., the second largest producer in the Fairbanks district, recovered 8,747 ounces of gold and 1,110 ounces of silver from 671,164 cubic yards of gravel handled by a Walter Johnson Diesel-powered bucket-line dredge equipped with seventy-eight 4½-cubic-foot buckets on Caribou Creek (in the Salcha area).

Of those producers of gold from placers worked hydraulically and in combination with draglines, bulldozers, and pumping equipment, the Alder Creek Mining Co. was the largest. Two dragline excavators (with 1½- and 2-cubic-yard buckets, respectively), three bulldozers, and four hydraulic giants were used by the company during the 1949 season on Fairbanks Creek from May 5 to October 15. Other producers of a substantial quantity of placer gold in the district, using similar combinations of equipment, were Four A Mining Co. on Pedro Creek (bulldozer-hydraulic), Helmer Johnson on Cleary Creek from May 10 to October 12 (hydraulic with bulldozer equipment), G. B. Martin on Pedro Creek (bulldozer-hydraulic), Ernest L. Maurer on Last Chance Creek (bulldozer-hydraulic), Strom Co. on Rose Creek (dragline-bulldozer-hydraulic), Wildt & Townley on Homestake Creek (bulldozer-hydraulic), and Williams Mining Co. on Gilmore Creek.

Production of gold from lode mines in the Fairbanks district in 1949 was even smaller than has been usual during the postwar period of high costs for labor, supplies, and equipment. Only three operators reported activity during the season. Jokela & Lazeration worked the Greenback claims on Pedro Dome at the head of Little Eldorado Creek and recovered a moderate quantity of gold from gold ore treated by amalgamation at the Cleary Hill Mines Co. mill on Cleary Creek. E. L. Kay operated the Lone Tree (Sanford) mine on Ester Dome during a 7-month period in 1949. Howard Sparks recovered a small quantity of gold as a byproduct of antimony mining and milling at the Tolovana mine on Willow Creek during July 1949.

Fortymile District.—Of the placer gold reported recovered in the district in 1949 (excluding that quantity of natural gold concerning which records are incomplete), 81 percent came from properties operated by the Yukon Placer Mining Co. on Canyon Creek (1,946 ounces of gold and some silver recovered from 94,000 cubic yards of gravel by the use of a bucket-line dredge equipped with fifty-eight 2½-cubic-foot buckets) and Walker's Fork (248 ounces of gold and 38 ounces of silver recovered from 26,000 cubic yards of gravel by the

use of bulldozers and a sluice box), and the Wade Creek Dredging Co. on Wade Creek (3,566 ounces of gold and some silver recovered by the bulldozer-sluice box method from 189,000 cubic yards of gravel). A substantial quantity of gold also was produced by the Franklin Mining Co. from the Meldrum property on Chicken Creek (bulldozer-hydraulic) and the Uhler Creek Mining Co. on Uhler Creek. Several other producers in the area, using similar equipment, reported outputs of less than 200 ounces of gold.

Hot Springs District.—The largest producer of gold in the district in 1949 (on the basis of reported output for all producers excluding natural gold sold, quantity unreported) was A. W. Pringle, who operated on Rhode Island Creek (bulldozer-hydraulic). Other producers in the district with reported outputs of 100 to 400 ounces of gold, using various combination of bulldozers, hydraulic equipment, and draglines with bedrock sluice boxes, were Cleary Hill Mines Co. on Sullivan Creek and Tofty Gulch, Coble & Francis and Pete Johnson on Eureka Creek, Johnson & Johnson on Glenn Gulch, Enstrom & McDougall on American Creek, and Doyle & Conners on New York Creek. Otto Hoverly worked a small drift mine on Cache Creek (Cannon Ball 1, 2, 3, and 4 claims) near Tofty.

Hughes District.—Only one producer reported activity in the district in 1949. Strandberg & Sons, using dragline-bulldozer-hydraulic equipment, recovered a substantial quantity of gold from Utopia Creek.

Iditarod District.—The largest producer of gold in the district in 1949, as in 1948 (on the basis of reported data), was the North American Dredging Co., which operated its Diesel-powered bucket-line dredge equipped with seventy 3½-cubic-yard buckets on the Mohawk Association property on Otter and Flat Creeks between June 10 and October 18. Among the larger operators which produced placer gold with dragline-bulldozer-hydraulic equipment were Hatton & Turner on Willow Creek, Awe Mining Co. on Chicken Creek, Uotila & Ogriz on Slate Creek, Moore Creek Mining Co. on Moore Creek, and the Alpha Mining Co. on Alpha Association property on Flat Creek. The Prince Creek Mining Co. on Prince Creek and Gust Backstrom on Flat Creek recovered a moderate quantity of gold by hydraulicking.

Innoko District.—Several thousand ounces of natural gold produced from the Innoko district in 1949 were sold on the open market; but, inasmuch as only part of this output was reported, the relative rank in output of each producer is in doubt. On the basis of known data the principal operators of placer-gold mines in the district in 1949—all of which used dragline-bulldozer-hydraulic equipment in conjunction with a sluice box, either of the bedrock or elevated type—were Cripple Creek Mining Co. (Strandberg & Sons) on Cripple Creek, Degnan Mining Co. on Little Creek, Gurther & Myklebust on Little Creek and (N. J. Vibe estate) Anvil Creek, Hard & Uotila on Bear Creek, Hubbard & McFarland on Little Creek and Lower Ganes Creek, Rosander & Reed on Yankee Creek, Savage & Matheson on Spruce Creek, and Uotila & Hard on Ophir Creek. The mining season in the district lasted about 5½ months, from early May to mid-October.

The Innoko Dredging Co. (Repo & Molitor, lessees) was rebuilding the bucket-line dredge on Ganes Creek during 1949; the boat will be Diesel-powered and equipped with seventy 3½-cubic-foot buckets.

Kantishna District.—The Glacier Creek Mining Co. operated on Glacier Creek from June 15 to September 10, using the dragline-bulldozer-dry-land washing plant equipment leased from Caribou Mines. The ground on Caribou Creek and Glacier Creek is considered to be worked out, and neither company plans to resume operation in the area. Hosler Mines operated on Eureka Creek (bulldozer-hydraulic) from June 25 to September 10; and Hunter & Burnett, using similar equipment, recovered a moderate quantity of gold from its property on Crooked Creek.

Koyukuk District.—The South Fork Mining Co. again—as in 1948—was the largest producer of gold in the district. Operating its dragline-bulldozer combination with a bedrock sluice on gold bench, on the South Fork of Koyukuk River from April 15 to September 1, 800 ounces of gold and 82 ounces of silver were recovered from 43,000 cubic yards of gravel. Using the same type of equipment, the Myrtle Creek Mining Co. operated on Myrtle Creek in 1949. Another producer of a moderate quantity of gold, but with bulldozer-hydraulic equipment, was the Wild Lake Mining Co. (Savage & Doheny) which operated on Spring Creek from June 15 to August 31. Other producers of smaller quantities of gold in the district (on the basis of reported data) included A & S Mining Co. on Crevice Creek, Nesland & White on Vermont and Portage Creeks (bulldozer), E. H. Pitts on Lake Creek (hydraulic), Stanich Bros. on Porcupine Creek, and Bill Vurcich on Sheep Creek.

Marshall District.—Johnson & Ostnes operated a dry-land dredge (dragline and movable elevated washing plant) on claims 2 and 3 below Discovery on Willow Creek from June 1 to October 4.

Rampart District.—The Little Minook Mining Co. operated on Little Minook Creek during the 1949 season from May 15 to September 29 and recovered 1,454 ounces of gold and 205 ounces of silver from 88,000 cubic yards of gravel, using a dragline-bulldozer-hydraulic combination. Hunter Creek Mining Co. produced 207 ounces of natural gold from Hunter Creek by the bulldozer-hydraulic method from July 12 to August 28; but the greater part of the output was not sold. A substantial quantity of gold was produced by Swanson Bros. & Saarela on Hunter Creek from May through September 15, using bulldozers and a sluice plate. Pierce & Cravey operated on Gunnison Creek and recovered a moderate quantity of gold. Frank J. Dinan worked claim 2 below Discovery on Florida Creek by drift mining.

Ruby District.—Peter Miscovich & Sons, using a dragline-bulldozer-pump combination on Flat Creek, June through October 11, was the largest gold producer in the district in 1949. The Iditarod Operating Co., operating on Golden Creek, 30 miles south of Tanana, from July 1 to September 25, recovered 780 ounces of gold and 96 ounces of silver from 129,400 cubic yards of gravel handled by bulldozers and washed over a bed-rock sluice plate. Other producers of substantial quantities of gold in the district using similar type of equipment, some with a dragline, were Granite Creek Mining Co. (Carlo & May) on Ophir Creek; Iver Johnson & Co. on Trail Creek; Midnight Mining Co.

(Coyle & Rasmussen), operating the Enterprise and Rabbit Fraction claims on Midnight Creek (Fox Association); and Clarence Zaiser on Spruce Creek.

Tolovana District.—Olive Creek Mines (as in 1948) was the largest producer of gold in the district; 1,705 ounces of gold and 178 ounces of silver were recovered from 70,000 cubic yards of gold-bearing gravel handled by the commonly used bulldozer-pump-sluice-box method, the tailings being removed by a dragline. The operation was on the N. R. Hudson property on Olive Creek near Livengood. Warwick Mines, using a bulldozer-hydraulic combination on Gertrude Creek from May 1 to October 5, recovered 618 ounces of gold and some silver from 140,000 cubic yards of gravel. The Amy Creek Mining Co., using the bulldozer-hydraulic combination to handle gravel, a sluice box, and a dragline to remove tailings, operated on Amy Creek bench from April 18 to September 18. Wilbur Mines operated on Wilbur Creek (bulldozer-hydraulic) during a 4-month period, and Car, Jurich & Mandish hydraulicked on Lillian Creek from June 1 to August 31.

OTHER MINERALS

Antimony.—Earl Pilgrim operated the Stampede mine in the Kantishna district and was the only producer reporting shipments of antimony ore or concentrates from Alaska in 1949. Shipments were 74 tons of concentrate containing 87,780 pounds of antimony. The Sawtooth Mining Co. suspended its development program at an antimony occurrence near Rampart; 100 tons of 50-percent antimony ore mined in 1948 was still at the property pending advantageous market conditions for shipment. The Antimony Corp. of Alaska produced a small tonnage of antimony ore from the Rambler mine on Boulder Creek in the Tok district; no shipments were made to the United States. Howard Sparks developed the Tolovana mine, Fairbanks district, and set up a small flotation plant for antimony concentrate; no shipments were made.

Coal.—Alaska produced 455,000 short tons (preliminary figure) of bituminous coal and lignite in 1949, 12 percent more than in 1948; but owing to a lower unit price the value increased only 10 percent. Nevertheless, all-time peaks in total value as well as quantity were established in 1949. Several additional properties were operated in 1949, mostly small producers, and the largest proportion of the output, as heretofore, came from one mine in the Matanuska Valley field and three mines in the Nenana field.

Gem Stones.—No jade (nephrite) was reported produced in the Kobuk area in 1949.

Limestone.—The Permanente Cement Co. shipped limestone during 1949 from its quarry on Dall Island in the Ketchikan district, Southeastern Alaska, to Washington State for the manufacture of cement.

Mercury.—Underground activity at the Decoursey Mountain mine, 24 miles from Crooked Creek, was stopped in August 1948, but placer operations there yielded 100 flasks of mercury in 1949.

Platinum Metals.—Placer deposits in the Goodnews Bay district, Kuskokwim region, continued to yield a substantial quantity of crude platinum metal; the output in 1949 was higher than in 1948. The

Goodnews Bay Mining Co. operated its Yuba electrically powered bucket-line dredge (with ninety-three 8-cubic-foot buckets) on the Salmon River for the recovery of crude platinum metals during the period from April 30 to November 15.

Sand and Gravel.—Production of sand and gravel in Alaska was reported by R. J. Sommers Construction Co., Juneau; Anchorage Sand & Gravel Co., Inc., Anchorage; the Alaska Road Commission; Bureau of Public Roads; Naval Operating Base, Kodiak; and the Corps of Engineers, Department of the Army.

Tin.—Output of tin in Alaska in 1949 was small—produced under difficulties in an isolated area—but was substantially above the 1948 level. The Northern Tin Co., Inc., shipped 47 short tons of placer-tin concentrate, containing 33 tons of tin, recovered from 39,000 cubic yards of gravel mined on Buck Creek; and the U. S. Tin Corp. produced 43 tons of concentrate (not sold), containing 23 tons of tin and a substantial quantity of tungsten, which was recovered from approximately 15,000 cubic yards of placer material mined from its Lost River property. Both operations are in the Port Clarence district, Seward Peninsula region. The Cleary Hill Mines Co. reported the recovery of a small quantity of tin concentrate as a byproduct of its placer-gold operation near Tofty in the Hot Springs district, Yukon River Basin region.

Tungsten.—The J. H. Scott Co., operating the Riverside mine near Hyder, Southeastern Alaska, produced a small quantity of tungsten concentrate from ore mined chiefly for its lead content in 1949; none of the material was shipped.

Miscellaneous Minerals.—Data on production of stone are not available for publication. There was no recorded production of asbestos, chromite, or petroleum in Alaska in 1949.

Arizona
Gold, Silver, Copper, Lead, and Zinc

(MINE REPORT)

By C. E. Needham and Paul Luff

GENERAL SUMMARY

COPPER—the principal metal mined in Arizona—decreased from 375,121 short tons in 1948 to 359,010 tons in 1949, a 4-percent loss. However, the State made a record production of both lead and zinc in 1949, and production of silver was the greatest since 1943; the yield of gold declined slightly. Lead increased from 29,899 short tons in 1948 to 33,568 in 1949, a 12-percent gain; zinc from 54,478 short tons to 70,658, a 30-percent gain; and silver from 4,837,740 fine ounces to 4,970,736, a 3-percent gain; gold declined slightly from 109,487 fine ounces to 108,993. The State remained the largest producer of copper in the United States, ranked second in zinc, and was fourth in lead and silver; it again ranked first in total value of the five metals.

The total value of the five metals was $177,894,134 in 1949, compared with $196,207,948 in 1948, a 9-percent loss. The total value of the gold was $3,814,755—2 percent of the State total value; silver, $4,498,767—3 percent; copper, $141,449,940—79 percent; lead, $10,607,488—6 percent; and zinc, $17,523,184—10 percent. The value of the metals recovered from copper ore was $143,441,196 in 1949 ($166,494,997 in 1948) or 81 percent of the State total. About 89 percent of the State gold production and 75 percent of the silver in 1949 came from six districts—Ajo, Big Bug, Copper Mountain (Morenci), Pioneer (Superior), Verde (Jerome), and Warren (Bisbee); 99 percent of the copper came from eight districts—Ajo, Copper Mountain (Morenci), Eureka (Bagdad), Globe-Miami, Mineral Creek (Ray), Pioneer (Superior), Verde (Jerome), and Warren (Bisbee); 92 percent of the lead came from six districts—Aravaipa, Big Bug, Harshaw, Old Hat, Pima, and Warren (Bisbee); and 96 percent of the zinc came from eight districts—Big Bug, Cochise (Dragoon), Eureka (Bagdad), Harshaw, Old Hat, Pima, Verde (Jerome), and Warren (Bisbee).

Outstanding features of Arizona's mining activities in 1949 were suspension in June of copper mining at the Copper Queen mine of the Phelps Dodge Corp. at Bisbee and curtailment of operations at other large copper-producing mines, resulting from a sharp drop in copper demand followed by continuous declines in the price of copper during the second quarter of the year; the record output of zinc-lead ore from mines in the Aravaipa, Big Bug, Pima, Old Hat, and Warren (Bisbee) districts; the notable production of zinc in the Verde (Jerome) district; the sinking of two shafts by the Magma Copper Co. for underground development of the large copper ore body at the San Manuel property in the Old Hat district; the development of

two large copper ore bodies in the Globe-Miami district by the Miami Copper Co.; and the beginning of the construction of a new copper smelter at Ajo by the Phelps Dodge Corp.

All tonnage figures are short tons and "dry weight"; that is, they do not include moisture.

The value of the metal production reported herein has been calculated at the following prices.

Prices of gold, silver, copper, lead, and zinc, 1945–49

Year	Gold[1] (per fine ounce)	Silver[2] (per fine ounce)	Copper[3] (per pound)	Lead[3] (per pound)	Zinc[3] (per pound)
1945	$35.00	$0.711+	$0.135	$0.086	$0.115
1946	35.00	.808	.162	.109	.122
1947	35.00	.905	.210	.144	.121
1948	35.00	.905+	.217	.179	.133
1949	35.00	.905+	.197	.158	.124

[1] Price under authority of Gold Reserve Act of Jan. 31, 1934. Treasury legal coinage value of gold from Jan. 18, 1837, to Jan. 31, 1934, was $20.67+($20.671835) per fine ounce.
[2] Treasury buying price for newly mined silver. 1945 to June 30, 1946: $0.71111111: July 1, 1946, to Dec. 31, 1947: $0.905; 1948–49: $0.9050505.
[3] Yearly average weighted price of all grades of primary metal sold by producers: Price in 1945–47 includes bonus payments by Office of Metals Reserve for overquota production.

Mine production of gold, silver, copper, lead, and zinc in Arizona, 1945–49, and total, 1860–1949, in terms of recoverable metals

Year	Mines producing		Ore (short tons)	Gold (lode and placer)		Silver (lode and placer)	
	Lode	Placer		Fine ounces	Value	Fine ounces	Value

[1] Figure not available. [2] Corrected figure.

The average price of copper, lead, and zinc declined in 1949—copper to 19.7 cents a pound, lead to 15.8 cents a pound, and zinc to 12.4 cents a pound. The price of gold remained at $35 a fine ounce and silver at $0.905+ a fine ounce. At the beginning of the year the price of copper was 23.5 cents a pound, lead 21.5 cents a pound, and zinc 17.5 cents a pound. After continuous declines during the second quarter of the year, the price of copper reached a low of 16.0 cents

a pound June 17, lead dropped to a low of 12 cents a pound May 26, and zinc dropped to a low of 9 cents a pound June 15. At the end of the year, the price of copper was 18.5 cents a pound, lead 12 cents a pound, and zinc 9.75 cents a pound.

Mine production of gold, silver, copper, lead, and zinc in Arizona in 1949, by months, in terms of recoverable metals

Month	Gold (fine ounces)	Silver (fine ounces)	Copper (short tons)	Lead (short tons)	Zinc (short tons)
January	10,160	422,152	32,926	2,320	4,725
February	8,971	409,678	31,986	2,430	5,180

[1] Includes all placer operations using power excavator and washing plant, both on dry land; an outfit with movable washing plant is termed a "dry-land dredge"

Gold.—Despite a substantial increase in the production of gold from zinc-lead ore and zinc-copper ore in Arizona in 1949, the State output of gold declined slightly from 1948 owing to a decrease in gold from copper ore and gold ore. In 1949, 72 percent of the State gold output was recovered from copper ore, 19 percent from zinc-lead ore, and most of the remainder from zinc-copper ore, gold ore, lead ore, and silver ore. Gold from copper ore decreased 5,656 ounces and that from gold ore 3,345 ounces, but that from zinc-lead ore increased 5,068 ounces and that from zinc-copper ore 3,410. Gold from placers decreased from 838 ounces to 565. The New Cornelia mine of the Phelps Dodge Corp. in Pima County continued to be the leading gold producer in Arizona; it was followed by the Iron King mine in Yavapai County, the Magma mine in Pinal County, the Copper Queen (Bisbee) branch of the Phelps Dodge Corp. in Cochise County, the United Verde branch of the Phelps Dodge Corp. in Yavapai County, and the

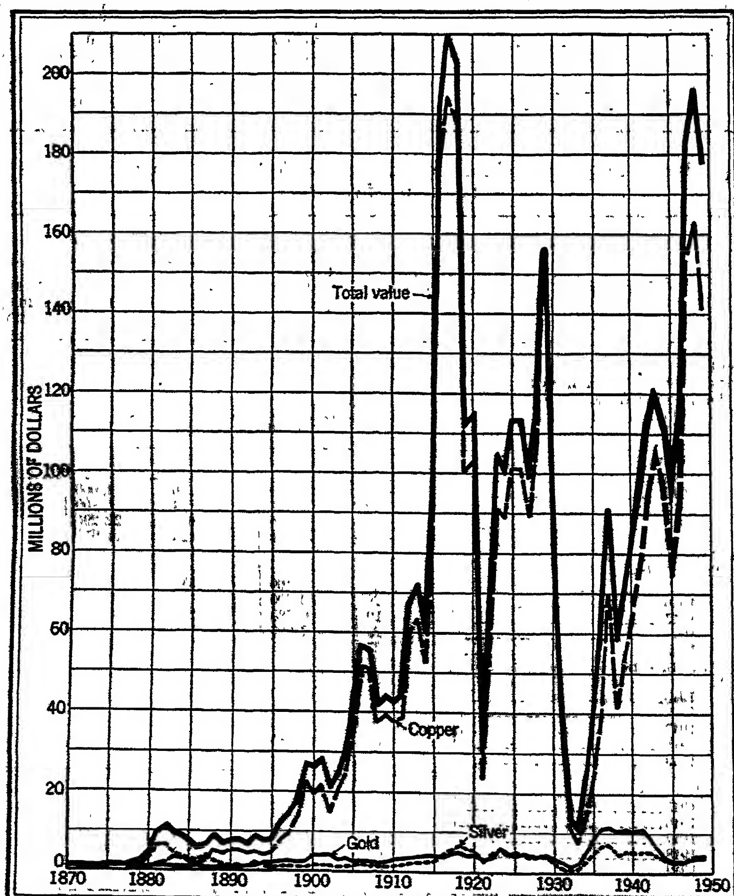

FIGURE 1.—Value of mine production of gold, silver, and copper and total value of gold, silver, copper, lead, and zinc in Arizona, 1870–1949. The value of lead and zinc has been less than $2,000,000 annually, except in a few years.

Morenci branch of the Phelps Dodge Corp. in Greenlee County; these six properties produced 88 percent of the State total gold.

Silver.—Most of the silver produced in Arizona is a byproduct of copper ore and zinc-lead ore, and in 1949 these two classes of ore yielded 4,332,989 ounces of silver (87 percent of the State total) compared with 4,358,986 ounces in 1948. A marked increase in production of silver from zinc-copper ore in 1949 prevented a decline in the State silver output. Copper ore yielded 2,412,359 ounces of silver (49 percent of the State total) and zinc-lead ore, 1,920,630 ounces (39 percent); the remainder came principally from silver ore, zinc-copper ore, lead ore, and zinc-lead-copper ore. Silver from copper ore decreased 402,474 ounces or 14 percent, but that from zinc-lead ore increased 376,477 ounces or 24 percent; that from zinc-copper ore, 132,278 ounces or 201 percent; and that from silver ore, 62,415 ounces or 25 percent. The Phelps Dodge Corp. continued to be the chief silver producer in Arizona, although its output was about 135,000 ounces (5 percent) less than that in 1948; its four properties (Copper Queen, Morenci, New Cornelia, and United Verde) produced 63 percent of the State gold output, 55 percent of the silver, and 63 percent of the copper; and its Copper Queen branch also produced 41 percent of the State's lead and 50 percent of the zinc. Other large silver producers in Arizona in 1949 were Iron King, Magma, San Xavier (Eagle-Picher Mining & Smelting Co.), Ash Peak, and Flux-January-Norton properties.

Copper.—Arizona's output of recoverable copper dropped to 718,020,000 pounds in 1949—32,222,000 pounds less than in 1948—owing to suspension in June of copper mining at the Copper Queen mine and to curtailment at other large copper producers. The Copper Moun-

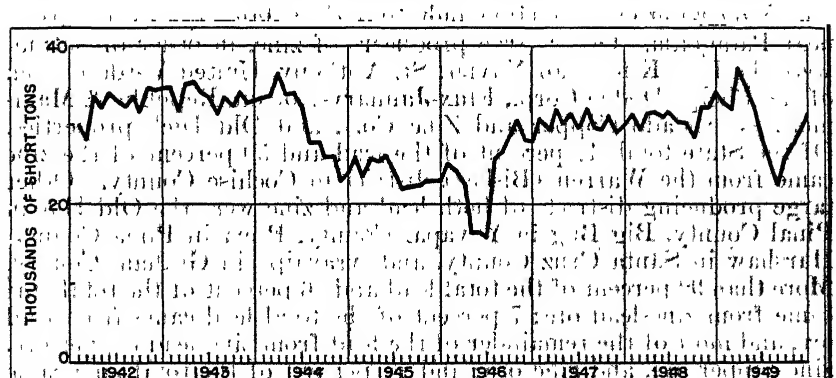

FIGURE 2.—Mine production of copper in Arizona, 1942–49, by months, in terms of recoverable metal.

tain (Morenci) district, with an output of 283,867,000 pounds of copper, remained the leading copper-producing area in the State; it was followed by the Globe-Miami district with 160,377,000 pounds, Ajo with 116,700,000, Pioneer (Superior) with 43,231,000, Mineral Creek

(Ray) with 37,190,600, Verde (Jerome) with 34,429,800, Warren (Bisbee) with 19,680,700, and Eureka (Bagdad) with 15,812,000. Substantial decreases in copper output in the Copper Mountain (Morenci), Globe-Miami, and Warren (Bisbee) districts more than offset increases in the Ajo, Eureka (Bagdad), Pioneer (Superior), and Verde (Jerome) districts. Copper ore and its products yielded 703,053,481 pounds of copper as follows: 33,528,676 tons of copper ore treated by concentration yielded 84 percent; 468,934 tons of copper ore shipped crude to smelters 5 percent; and 3,368,001 tons of copper ore leached and 14,608 tons of cement copper (from mine-water precipitates and underground leaching operations) 11 percent. The Morenci branch of the Phelps Dodge Corp. was again the largest copper producer in Arizona; it was followed in order by the New Cornelia branch of the Phelps Dodge Corp., Inspiration, Miami, Castle Dome, Magma, Ray (Kennecott Copper Corp.), United Verde branch of the Phelps Dodge Corp., Copper Queen branch of the Phelps Dodge Corp., and Bagdad properties. These 10 properties produced 99 percent of the State total copper.

Lead and Zinc.—In 1949 Arizona exceeded its 1948 record output of lead and its 1947 record output of zinc. The production of lead in 1949 (33,568 short tons) and the production of zinc (70,658 tons) were the largest for any year in the history of the State. Arizona mines have succeeded in setting a record lead output each year since 1944 and, except 1948, have made a record zinc output each year since 1940. The Copper Queen mine of the Phelps Dodge Corp. at Bisbee, with an increase of 23 percent in lead production and 28 percent in zinc production, remained by far the largest producer of lead and zinc in Arizona in 1949. Other large producers of lead, in order of output, were the St. Anthony property at Tiger, San Xavier mine near Sahuarita, Iron King mine at Humboldt, and Flux-January-Norton group near Patagonia. Other large producers of zinc, in order of output, were the Iron King, San Xavier, St. Anthony, United Verde branch of the Phelps Dodge Corp., Flux-January-Norton, Republic & Mammoth (Coronado Copper and Zinc Co.), and Old Dick properties. Of the State total, 41 percent of the lead and 50 percent of the zinc came from the Warren (Bisbee) district in Cochise County. Other large producing districts of both lead and zinc were the Old Hat in Pinal County, Big Bug in Yavapai County, Pima in Pima County, Harshaw in Santa Cruz County, and Aravaipa in Graham County. More than 92 percent of the total lead and 86 percent of the total zinc came from zinc-lead ore; 7 percent of the total lead came from lead ore, and most of the remainder of the lead from zinc-lead-copper ore, zinc-copper ore, and zinc ore; and 11 percent of the total zinc came from zinc-copper ore, and most of the remainder from zinc ore and zinc-lead-copper ore.

MINE PRODUCTION BY COUNTIES

Mine production of gold, silver, copper, lead, and zinc in Arizona in 1949, by counties, in terms of recoverable metals

County	Mines producing		Gold (lode and placer)		Silver (lode and placer)	
	Lode	Placer	Fine ounces	Value	Fine ounces	Value
Cochise	37		12,854	$449,890	1,230,023	$1,113,233

MINING INDUSTRY

Despite a year of wide fluctuation in the market prices of copper, lead, and zinc, Arizona's mining industry in 1949 was good compared with that of other States. The output of copper ore decreased 4 percent from the record of 39,072,204 tons in 1948 to 37,365,611 tons in 1949, but the output of zinc-lead ore increased from a record of 664,603 tons to a new all-time record of 773,617 tons. Zinc-copper ore increased to 163,213 tons—a 61-percent gain—and zinc ore to 10,344 tons—a 161-percent gain; but siliceous ores declined to 38,967 tons—a 31-percent loss—and lead ore to 15,829 tons—a 32-percent loss. Of the State total ore, 37,321,394 tons (97 percent) were copper ore mined in the Copper Mountain (Morenci), Globe-Miami, Ajo, Mineral Creek (Ray), Eureka (Bagdad), Pioneer (Superior), Verde (Jerome), and Warren (Bisbee) districts, and 749,625 tons (97 percent) of the State total zinc-lead ore were mined in the Warren (Bisbee), Big Bug, Old Hat (Oracle), Pima, Harshaw, and Aravaipa districts. Mining operations at five open pits—Ajo, Bagdad, Inspiration, Miami (Castle

Dome), and Morenci—produced 29,082,243 tons of copper ore in 1949 compared with five open pits in 1948, which produced 29,638,873 tons. Development of open-pit mining at the Ray property of the Kennecott Copper Corp. has progressed to a point allowing production to begin early in 1950. Labor was more plentiful in 1949 than in 1948, although skilled miners continued scarce.

ORE CLASSIFICATION

Details of ore classification are given in the Gold and Silver chapter of this volume.

Ore sold or treated in Arizona in 1949, with content in terms of recoverable metals

Source	Mines producing	Ore (short tons)	Gold (fine ounces)	Silver (fine ounces)	Copper (pounds)	Lead (pounds)	Zinc (pounds)
Dry gold ore	76	4,567	2,178	7,156	22,668	22,715	80,446
Dry gold-silver ore	9	687	199	6,898	1,683	6,580	2,158
Dry silver ore	29	33,713	704	314,241	40,403	8,279	----------
Total	114	38,967	3,081	328,295	64,754	37,574	82,604
Copper ore	88	37,365,611	78,735	2,412,359	[1] 703,053,481	3,974	----------
Lead ore	117	15,829	1,710	76,822	66,923	4,457,110	252,070
Lead-copper ore	3	45	----------	271	2,789	12,792	1,010
Zinc ore	8	10,344	127	11,076	96,643	89,019	2,152,656
Zinc-copper ore	7	163,213	4,336	198,089	8,663,807	143,602	16,085,522
Zinc-lead ore	40	773,617	20,429	1,920,630	5,901,596	62,113,354	121,621,724
Zinc-lead-copper ore	6	5,253	10	23,131	170,007	278,575	1,120,414
Total lode mines	[2] 340	38,372,879	108,428	4,970,673	718,020,000	67,136,000	141,316,000
Placers	32	----------	565	63	----------	----------	----------
Total: 1949	372	38,372,879	108,993	4,970,736	718,020,000	67,136,000	141,316,000
1948	399	39,925,686	109,487	[3] 4,837,740	[4] 750,242,000	59,798,000	108,956,000

[1] Includes 76,951,738 pounds recovered from ore leached and mine-water precipitates.
[2] A mine producing more than 1 class of ore is counted but once in arriving at total for all classes.
[3] Includes 80 ounces recovered from underground mine-water precipitates.
[4] Includes 86,709,683 pounds recovered from ore leached and mine-water precipitates.

METALLURGIC INDUSTRY

Of the 38,372,879 tons of ore produced in 1949 in Arizona, 34,482,033 tons (90 percent) were treated at 33 milling plants and 3,368,001 tons (9 percent) at 1 copper leaching plant; the remainder—522,845 tons (1 percent)— was shipped crude to smelters.

Ore treated at milling plants in 1949 comprised chiefly 33,528,676 tons of copper ore, 771,296 tons of zinc-lead ore, and 163,119 tons of zinc-copper ore. Copper ore from the Miami property was treated by a combination of leaching and concentration, and copper ore from the Inspiration mine was treated by straight leaching and by leaching and concentration. The large copper-concentration plants at Morenci (45,000-ton a day), Ajo (25,000-ton), Miami (18,000-ton), Inspiration (18,000-ton), Castle Dome (10,000-ton), Hayden (10,000-ton), Bagdad (3,000-ton), Clarkdale (2,100-ton), and Superior (1,500-ton); the copper-leaching plants at Inspiration (9,000-ton), and Miami

(3,000-ton); and the zinc-lead concentration mills at Bisbee (Copper Queen 900-ton), Sahuarita (Eagle-Picher 500-ton), Humboldt (Iron King 670-ton), Tiger (St. Anthony 500-ton), and Patagonia (Trench 200-ton) were operated continuously in 1949, most of them at a higher rate than in 1948. The copper smelters of the Phelps Dodge Corp. at Clarkdale, Douglas, and Morenci, the International Smelting & Refining Co. copper smelter at Miami, the American Smelting & Refining Co. copper smelter at Hayden, and the Magma Copper Co. copper smelter at Superior operated continuously throughout the year. Most of the copper concentrates produced at mills in Arizona are treated at smelters in Arizona, but nearly all the lead concentrates produced at mills in Arizona in 1949 were shipped to the smelter at El Paso, Tex., and all the zinc concentrates were shipped to smelters at Amarillo and Dumas, Tex.; Fort Smith, Ark.; Henryetta, Okla.; and Anaconda and Great Falls, Mont.

The following tables give details of the treatment of ores produced in Arizona in 1949.

Mine production of metals in Arizona in 1949, by methods of recovery, in terms of recoverable metals

Method of recovery	Gold (fine ounces)	Silver (fine ounces)	Copper (pounds)	Lead (pounds)	Zinc (pounds)
Ore amalgamated	40	16			
Concentrates smelted	88,257	3,904,455	602,196,907	62,507,186	140,666,862

REVIEW BY COUNTIES AND DISTRICTS

COCHISE COUNTY

California District.—In 1949 eight mines in the California district produced 586 tons of ore containing 545 ounces of silver, 2,301 pounds of copper, 107,013 pounds of lead, and 67,409 pounds of zinc. The principal output was 459 tons of zinc-lead ore, shipped from the King-Ainsworth and Pine-Zinc properties to the Shattuck Denn custom flotation mill at Bisbee, Ariz., and 96 tons of lead ore produced from the Leadville group near Portal.

Cochise District.—Output in 1949 was nearly all zinc-copper ore from the Republic and Mammoth mines of the Coronado Copper & Zinc Co. near Dragoon; however, operations ceased June 30. The company reported that 37,558 tons of ore were treated in its 150-ton flotation mill, which yielded 2,264 tons of copper concentrate and 3,565 tons of zinc concentrate.

Dos Cabezas and Tevis District.—W. R. Shanklin worked the Gold Prince mine all year and shipped 761 tons of gold ore to the smelter at El Paso, Tex. The rest of the district output was 80 tons of zinc-lead ore produced from the LeRoy Consolidated Mines and a small lot of high-grade gold ore from the Double Eagle claim.

Golden Rule District.—Output in 1949 was 87 tons of lead ore produced from the Golden Rule mine near Dragoon and 35 tons of zinc ore from the Hubbard mine.

[1] Dripping Springs district lies in both Gila and Pinal Counties.
[2] Pioneer district lies in both Gila and Pinal Counties.
[3] White Picacho district lies in both Maricopa and Yavapai Counties.
[4] Old Hat district lies in both Pima and Pinal Counties.

Hartford (Huachuca Mountains) District.—Lead ore (67 tons) was produced in 1949 from the Armistice, Anne Marie, and Borderland Metals properties near Hereford.

Smelter District.—Virtually all output was lead residues (1,238 tons) shipped from the Phelps Dodge Corp. copper smelter at Douglas, Ariz.

Swisshelm (Elfrida) District.—In 1949 two mines—the Chance and Scribner—in the Swisshelm district produced 5,878 tons of lead ore containing 298 ounces of gold, 34,073 ounces of silver, 12,721 pounds of copper, 1,848,870 pounds of lead, and 156,250 pounds of zinc. The Scribner mine, operated all year by Edwin Larson, was by far the most important producer.

Tombstone District.—Output in 1949 comprised 900 tons of zinc-lead ore, 116 tons of lead ore, 27 tons of gold-silver ore, and 4 tons of silver ore, which contained 11 ounces of gold, 2,286 ounces of silver, 4,871 pounds of copper, 97,738 pounds of lead, and 78,399 pounds of zinc. All the zinc-lead ore was produced from the Mary Jo mine by the Charleston Lead Mines Co.; the lead ore came largely from the Tombstone Extension and Bald Eagle properties and all the gold-silver ore from the Tombstone group.

Turquoise (Courtland, Pearce, Gleeson) District.—In 1949 five mines in the Turquoise district produced 8,798 tons of ore containing 21 ounces of gold, 10,357 ounces of silver, 64,478 pounds of copper, 108,783 pounds of lead, and 1,703,371 pounds of zinc. The principal output was zinc ore (8,161 tons) from the San Juan group, operated by the Billingsley Machinery Co., and the Abril group, operated by the Shattuck Denn Mining Corp.; however, both properties closed down in May owing to the drop in the price of zinc. Zinc-lead ore (472 tons) was produced from the Last Chance claim, copper ore (164 tons) from the Shannon group, and lead ore (1 ton) from the Sycamore claim.

Warren (Bisbee) District.—The Warren district continued to be the largest producer of silver, lead, and zinc in Arizona and in 1949 ranked fourth in gold and seventh in copper. The gold output declined 38 percent from 1945, silver 19 percent, and copper 49 percent, but the lead output increased 23 percent and zinc 28 percent. The value of the metal output of the district decreased from $21,686,724 in 1948 to $18,505,611 in 1949, owing to lower base-metal prices and a marked drop in copper output. The large decrease in copper output resulted from the closing June 5 of copper operations at the Copper Queen mine of the Phelps Dodge Corp., caused from continued declines in the price of copper during the second quarter of the year. The corporation reported that the Copper Queen branch produced 138,413 tons of copper ore and 280,742 tons of zinc-lead ore in 1949 compared with 302,941 and 218,466 tons, respectively, in 1948. In addition, 429 tons of copper precipitates were produced. The zinc-lead ore was treated in the corporation 900-ton flotation mill at Bisbee; and the copper ore, along with the copper precipitates, was shipped direct to the corporation smelter at Douglas.

According to the corporation annual report for 1949, mining of copper ore at the Copper Queen mine was suspended in June owing to the unfavorable market situation during the second quarter of the year. Copper produced in 1949 totaled 21,864,907 net pounds compared with 36,587,178 net pounds in 1948; lead produced totaled

20,718,742 net pounds compared with 17,550,887 net pounds; and zinc produced totaled 56,685,269 net pounds compared with 46,868,961 net pounds. The zinc-lead ore reserves minable at present prices will be substantially exhausted in 1950, and it is planned to discontinue zinc-lead mining around the middle of the year. When zinc-lead operations cease, it is expected that, if economic conditions warrant, the mining of copper ore will be resumed.

The Shattuck Denn Mining Corp. 150-ton flotation mill at Bisbee operated entirely on custom ores until October 31, when it was shut down resulting from lack of a sufficient supply of custom ores. As a result of the sale of the Denn mine in 1947, and the closing of its custom mill in 1949, the corporation is now conducting no active business in the Bisbee district after approximately 45 years of activity.

COCONINO COUNTY

Lessees continued operations at the open pit of the Petoskey mine in the Jacob Canyon (Warm Springs) district and shipped 1,257 tons of carbonate copper ore containing 6 ounces of gold, 452 ounces of silver, and 159,392 pounds of copper.

GILA COUNTY

Banner (Christmas and Tornado) District.—The principal output of the Banner district continued to be high-lime fluxing ore (31,741 tons in 1949), containing an average of 2.645 percent copper. The ore was shipped from the Christmas mine by the Sam Knight Mining Lease, Inc., to the copper smelter at Hayden, Ariz., where it is needed for fluxing purposes. Other district production included 267 tons of lead ore and copper ore shipped from the Kullman-McCool and London-Arizona properties near Winkelman.

Dripping Springs District.—Harry Storm worked the C–B claim and shipped 253 tons of lead ore to the smelter at El Paso, Tex.

Globe-Miami District.—The Globe-Miami district, with a production of 160,377,000 net pounds of copper in 1949 (176,956,200 net pounds in 1948), continued to rank second among the important copper-producing areas in Arizona; the Copper Mountain (Morenci) district in Greenlee County remained in first place. The Inspiration property, with a yield of 62,805,750 net pounds of copper (76,705,570 net pounds in 1948), remained the leading copper producer in the district and ranked third in the State. The Inspiration Consolidated Copper Co. reported that 3,619,906 tons of copper ore were treated in 1949 compared with 3,978,373 tons in 1948. Of the total ore, 3,368,001 tons, averaging 0.978 percent copper—0.563 percent copper as oxide and 0.415 percent as sulfide—from which the slimes had been removed, were treated by acid ferric sulfate in the main leaching plant. Slimes (239,753 tons averaging 1.421 percent copper) removed from ore at the main leaching plant were treated in the company flotation concentrator for extraction of the sulfide copper content, and the tailings from the operation were leached by sulfuric acid solution for extraction of the oxide copper content. In addition, 12,752 tons of crude copper ore and 86 tons of copper precipitates were sent direct to the smelter at Miami, Ariz. The total copper production per ton of ore treated in 1949 was 17.674 pounds.

According to the report of the Inspiration company for 1949, operations proceeded at a curtailed rate from May into November owing to a decline in the demand for copper. Ore production was from both underground and open-pit operations—2,016,086 tons of ore averaging 0.960 percent copper were mined from underground and 1,597,384 tons averaging 1.063 percent copper from the open pit. All necessary work underground was completed during the year for leaching in place certain mined-out and caved areas in the mine to recover part of the remaining copper, and surface installations were virtually completed. Production of copper from this source will begin in 1950.

The Miami mine of the Miami Copper Co. and the Castle Dome Copper Co., Inc. (a wholly owned subsidiary of the Miami Copper Co.), ranked second and third, respectively, in copper production in the district. The Miami Copper Co. reported that 96,553,259 net pounds of copper were produced from the two properties in 1949 (50,247,202 net pounds from the Miami mine and 46,306,057 net pounds from the Castle Dome mine) compared with 99,004,662 net pounds in 1948.

According to the annual report of the Miami Copper Co. for 1949, copper was produced at the Miami mine by underground mining followed by flotation and by acid leaching of material overlying the mined-out areas. The 18,000-ton concentrator treated 3,844,138 tons of ore averaging 0.735 percent copper, and 78,972 tons of copper concentrate and 3,029 tons of copper precipitates were shipped to smelters in Arizona. In addition to copper, the concentrate contained 1,216 ounces of gold and 44,450 ounces of silver, and re-treatment of copper concentrate recovered 502,858 pounds of molybdenum. Ore reserves, as of January 1, 1950, were estimated to be 23,004,854 tons averaging 0.833 percent copper. The Castle Dome open pit and 10,000-ton concentrator were operated continuously throughout 1949 but at a reduced rate beginning in July. The mill treated 3,744,922 tons of ore averaging 0.706 percent copper, which yielded 64,402 tons of copper concentrate. In addition to copper, the concentrate contained 1,261 ounces of gold and 79,449 ounces of silver. A total of 4,094,258 tons of waste was removed in connection with the mining of Castle Dome ore and to complete the stripping preparatory to mining Red Hill ore. As of January 1, 1950, ore reserves were estimated to be 9,960,027 tons averaging 0.701 percent copper, including the Red Hill ore. In addition, a block of approximately 3,665,000 tons averaging 0.54 percent copper is known to lie between the 4,040- and 4,085-foot levels of the Castle Dome ore body. Exploration by churn drilling during the past several years at the property of the company's wholly owned subsidiary—Copper Cities Mining Co. in the Globe-Miami district—was completed in 1949. A copper deposit amenable to open-pit mining and comparable in size and grade to the Castle Dome ore body was outlined.

The rest of the district output was largely 401 tons of copper ore produced from the Carlota, Copper Hill, and Superior & Boston properties.

Pioneer District.—Output in 1949 was principally 48 tons of silver ore produced from the El Capitan mine, 13 tons of copper ore from

the Mariana claim, and 13 tons of lead ore from the Silver Creek claim.

Summit District.—Output in 1949 was all copper ore (51 tons) produced from the Red Hill and Richard claims near Miami.

GRAHAM COUNTY

Aravaipa District.—Zinc-lead ore from the Aravaipa group of the Athletic Mining Co. near Klondyke continued to be the main output in the Aravaipa district. The company reported that 18,348 tons of zinc-lead ore were treated in its 100-ton flotation mill in 1949 and that 2,177 tons of similar ore were shipped direct to a smelter at El Paso, Tex. The total ore contained 1,206 ounces of gold, 21,803 ounces of silver, 146,000 pounds of copper, 2,272,000 pounds of lead, and 2,483,400 pounds of zinc. The rest of the district output was principally 2,524 tons of lead ore produced from the Sein Fein mine.

GREENLEE COUNTY

Ash Peak District.—All output in 1949 was fluxing ore (17,624 tons), averaging 0.037 ounce of gold and 8.963 ounces of silver to the ton and 80 percent silica, shipped to the International copper smelter at Miami from the Ash Peak mine near Duncan by the Ash Peak Lease.

Copper Mountain (Morenci) District.—The Copper Mountain district, with a production of 283,867,000 net pounds of copper in 1949 (296,632,000 net pounds in 1948), remained the chief copper-producing area in Arizona, as the Morenci mine of the Phelps Dodge Corp. continued to be the outstanding producer of copper in the State. The corporation reported that 14,488,723 tons of copper ore from the Morenci mine were treated in the 45,000-ton concentrator in 1949 compared with 15,567,480 tons in 1948 and that 536,603 tons of copper concentrate, 66,871 tons of crude copper ore, and 4,468 tons of copper precipitates were shipped direct to the Morenci smelter. In addition to copper, the mine was an important producer of gold and silver, and in November an experimental unit was placed in operation in one part of the concentrator to treat a portion of the copper concentrate for recovery of the molybdenite.

According to the annual report of the Phelps Dodge Corp. for 1949, the sharp drop in copper demand during the second quarter of the year caused a reduction in the workweek from 6 to 5 days; however, with an improving demand for copper, the 6-day workweek was resumed at Morenci early in September. Copper ore mined totaled 14,555,594 tons, and waste and leach material removed 20,460,851 tons, or a waste: ore ratio of 1.41: 1.

The remainder of the district output was 241 tons of gold-silver ore produced from the Bell and Climax Lode properties.

MARICOPA COUNTY

Big Horn District.—Leasing operations produced 21 tons of lead ore from the Lead Dike group south of Aguila.

Cave Creek and Camp Creek District.—Output in 1949 was mainly 45 tons of silver-copper ore produced from the Red Rover mine and 19 tons of copper ore from the Womack claim.

Sunflower District.—About 80 tons of silver-lead ore were shipped from the Saddle Mountain (Tri Metals) property, 45 miles northeast of Phoenix.

Vulture District.—Output in 1949 was largely 91 tons of gold ore produced from the Lucky Cuss claim west of Wickenburg.

MOHAVE COUNTY

Cedar Valley District.—In 1949 two mines near Yucca—Antler and Copper World—produced 5,059 tons of zinc-copper ore containing 26 ounces of gold, 3,121 ounces of silver, 278,688 pounds of copper, 60,673 pounds of lead, and 846,280 pounds of zinc. The Antler mine was operated all year by the Yucca Mining & Milling Co. and the Copper World by the Omega Metals Co.; flotation mills were installed at each property during the summer months.

Copper Mountain District.—Leland O. Whitmore operated the Copper Mountain claim in 1949 and shipped 195 tons of ore containing 163 ounces of gold, 1,728 ounces of silver, 12,628 pounds of copper, 8,387 pounds of lead, and 38,094 pounds of zinc.

Owens (McCracken and Potts Mountain) District.—Output in 1949 was principally 262 tons of lead ore produced from the old McCracken and Otsego mines, 45 miles southeast of Yucca, and 112 tons of gold ore from the Esperanza mine.

San Francisco (Oatman, Goldroad, Katherine, Vivian) District.—Lead ore (10 tons) was shipped from the Vivian mine, gold ore (10 tons) from the White Chief claim, and old mill cleanings (1 ton) from the Goldroad property.

Wallapai (Cerbat, Chloride, Mineral Park, Stockton Hill) District.—The output of gold, silver, copper, lead, and zinc in the Wallapai district in 1949 was much less than that in recent years, due chiefly to the closing of the Tennessee mine at Chloride in December 1948. In 1949 the output of the district was largely 4,500 tons of zinc-lead ore produced from the El Oro (Copper Age) mine and treated in the 100-ton flotation mill of the Mohave Lead & Zinc Co.; however, operations ceased in May. The rest of the district output was mainly 137 tons of zinc-lead ore produced from the Mary Bell and Samoa properties, 62 tons of lead-gold ore from the Hidden Treasure mine, 43 tons of gold ore from the Golden Gem mine, and 29 tons of lead ore from the Fountain Head and New London properties.

Weaver District.—Gold ore (99 tons) was shipped in 1949 from the Mocking Bird mine, 45 miles northwest of Kingman, and silver ore (10 tons) from the Weaver claim.

PIMA COUNTY

Ajo District.—The Ajo district continued to rank first in gold and third in copper output in the State, owing to steady operation of the New Cornelia copper mine of the Phelps Dodge Corp. Despite a reduction of the workweek from 6 to 5 days from May to September, the New Cornelia mine produced more copper ore in 1949 than in 1948. According to the annual report of the Phelps Dodge Corp. for 1949, the New Cornelia mine produced 8,122,473 tons of copper ore in 1949 and 5,700,740 tons of waste compared with 7,733,070 tons of ore and

5,970,732 tons of waste in 1948. The company 25,000-ton concentrator treated 8,126,032 tons of copper ore, which yielded 115,744,833 net pounds of copper compared with 110,062,421 net pounds in 1948. Good progress was made during the year on construction of the copper smelter at Ajo, which is expected to be completed and placed in operation in mid-1950.

Arivaca District.—Nearly all output in 1949 was silver-lead ore (32 tons) produced from the Eldorado, Honey House, Mentor, and Silver Flame properties.

Cababi District.—Gold ore (50 tons) was produced from the Cunquian and Sun-Gold claims and silver ore (16 tons) from the Old Timer mine near Sells.

Cerro Colorado District.—Lessees worked the Mary G mine near Amado in 1949 and shipped 93 tons of silver-lead ore to the smelter at El Paso, Tex.

Helvetia (Rosemont) District.—Production of ore in the Helvetia district in 1949 was much lower than in 1948, due to the drop in the prices of copper, lead, and zinc. In 1949 the King in Exile mine produced 2,065 tons of ore containing 2,267 ounces of silver, 212,156 pounds of copper, and 39,694 pounds of zinc. Copper ore (987 tons) was produced also from the Helvetia group and zinc-lead ore (118 tons) from the Daylight and Dimple properties.

Old Hat (Oracle) District.—Leasing operations at the old Leatherwood mine produced 84 tons of copper ore.

Pima (Sierritas, Papago, Twin Buttes) District.—The Pima district again ranked third in output of lead and zinc in Arizona, owing to the large production of zinc-lead ore from the San Xavier mine, near Sahuarita, operated by the Eagle-Picher Mining & Smelting Co. The company reported that the mine produced 82,661 tons of ore in 1949 compared with 72,314 tons in 1948. The ore was treated in the company 500-ton flotation mill, which yielded 12,862 tons of zinc concentrate, 7,291 tons of lead concentrate, and 135 tons of copper concentrate. The rest of the district output was largely 55 tons of silver-lead ore produced from the Dogtown claim and 35 tons of gold ore from the Golden Fleece mine.

Silver Bell District.—Output in 1949 comprised 102 tons of copper ore from the Atlas group, 77 tons of zinc-lead ore from the Silver Lead group, and 2 tons of lead ore from the Lead King claim.

PINAL COUNTY

Casa Grande District.—Sherwood B. Owens continued leasing operations at the Silver Reef mine and shipped 18,621 tons of ore containing 13 ounces of gold, 123,908 ounces of silver, 4,979 pounds of copper, and 2,100 pounds of lead.

Dripping Springs District.—In 1949 the output of the Dripping Springs district in Pinal County was mainly 525 tons of copper-silver ore shipped from the Monitor mine near Ray by various lessees.

Mineral Creek (Ray) District.—Copper ore from the Ray property of the Kennecott Copper Corp. continued to be the most important output in the Mineral Creek district; in 1949 it increased to 1,549,734 tons—a gain of 14,719 tons over 1948. The crude ore, averaging 1.239

percent copper, was coarse-crushed in a 12,000-ton crushing plant at the mine and the resulting product hauled by rail 26 miles to the corporation 10,000-ton flotation mill at Hayden, where it was reduced to 60,053 tons of concentrate containing 338 ounces of gold, 30,656 ounces of silver, and 32,128,350 pounds of copper. In addition, 3,389 tons of copper precipitates were produced, which contained 5,409,580 pounds of copper. According to the annual report of the Kennecott Copper Corp. for 1949, development and stripping of the open pit at Ray have progressed to a point allowing the production of approximately 2,500 tons of pit ore a day. The installation of new equipment to maintain ore production and treatment of 15,000 tons a day from the property is progressing satisfactorily and should be completed toward the end of 1950.

The remainder of the district output was principally 5,424 tons of oxide-copper ore produced from an open pit at the Copper Butte property and 2,135 tons of oxide-lead ore from the Ray Silver-Lead mine.

Mineral Hill District.—In 1949 eight mines in the Mineral Hill district produced 769 tons of ore containing 275 ounces of gold, 1,643 ounces of silver, 6,079 pounds of copper, 56,292 pounds of lead, and 21,510 pounds of zinc. Gold ore (457 tons) was produced from the Kortum, Thanksgiving, and Tom Thumb properties; lead ore (155 tons) from the Silver King mine; silver ore (80 tons) from the Mineral Mountain and Woodpecker claims; zinc-lead ore (53 tons) from the Wedge mine; and copper ore (24 tons) from an old waste dump.

Old Hat (Oracle) District.—About 142,900 tons of ore were produced in the Old Hat district of Pinal County in 1949; most of it was zinc-lead ore produced from the Mammoth-Collins group at Tiger by the St. Anthony Mining & Development Co. The company reported that 142,500 tons of ore, averaging 0.015 ounce of gold and 1.070 ounces of silver to the ton, 0.581 percent copper, 5.360 percent lead, and 5.456 percent zinc, were treated in its 500-ton gravity-flotation mill in 1949 compared with 109,801 tons in 1948. The property ranked second in production of lead in Arizona in 1949 and fourth in zinc. The rest of the district output was largely 263 tons of silver-lead ore produced from the Amphitheater group and 88 tons of zinc-lead ore from the Stove Lid claim. No ore was produced in 1949 from the San Manuel property south of Tiger, owned by the Magma Copper Co.; but, according to the company annual report for 1949, development of the copper-ore body has gone along steadily. No. 1 shaft was sunk 1,145 feet and was 1,270 feet deep at the end of the year; No. 2 shaft was sunk 798 feet and was 988 feet deep at the end of the year. The latter shaft, which was started in Gila conglomerate overburden, passed out of the conglomerate into the monzonite-ore body at a depth of 705 feet; copper in the ore occurs as chalcopyrite.

Pioneer (Superior) District.—In 1949 all the output of the Pioneer district was copper ore and silver ore from the Magma mine (Magma Copper Co.), one of the most important producers of gold, silver, and copper in Arizona. During the year 347,277 tons of copper ore were milled in the company 1,500-ton concentrator, which yielded 74,987

tons of copper concentrate. The concentrate and 31,842 tons of crude copper ore, as well as 1,798 tons of crude silver ore, were sent to the company's 450-ton smelter at Superior. The total ore averaged 0.033 ounce of gold and 1.09 ounces of silver to the ton and 6.14 percent copper. According to the company annual report for 1949, the net metal produced from Magma crude ore and concentrates comprised 11,533 ounces of gold, 371,402 ounces of silver, and 41,003,355 pounds of copper. The average cost of producing copper (after gold and silver values were deducted) was 17.94 cents a pound in 1949 compared with 18.11 cents in 1948. No. 4 section of the old mill was installed in the new mill, which increased the capacity of the new mill to 1,500 tons of copper ore a day or 1,100 tons of copper ore and 350 tons of zinc ore a day. The new mill began operating in January.

SANTA CRUZ COUNTY

Harshaw District.—In 1949 eight properties in the Harshaw district produced 48,189 tons of ore containing 117 ounces of gold, 155,785 ounces of silver, 230,967 pounds of copper, 3,435,814 pounds of lead, and 6,865,226 pounds of zinc. Most of the output was 47,918 tons of zinc-lead-silver ore produced from the Flux-January-Norton group, near Patagonia, by the American Smelting & Refining Co. This tonnage, along with 4,908 tons of ore received from custom shippers, was treated in the company 200-ton flotation mill, which yielded 2,878 tons of lead concentrate and 6,726 tons of zinc concentrate. The remainder of the district output consisted chiefly of 75 tons of lead ore from the Librada and Lenon claims, 73 tons of copper ore from the Volcano mine, 61 tons of silver ore from the Hermosa and World's Fair mines, and 45 tons of zinc-lead ore from the Humboldt mine.

Oro Blanco (Ruby) District.—Output in 1949 was 165 tons of zinc-lead ore from the Choctaw mine, 95 tons of zinc-lead ore and 49 tons of lead ore from the Montana group, and 4 tons of gold ore from the Austerlitz claim.

Patagonia (Duquesne) District.—A. R. Byrd, Jr., worked the Duquesne group all year; hauled 4,295 tons of ore, averaging 4.180 ounces of silver to the ton, 2.196 percent copper, 2.486 percent lead, and 13.274 percent zinc, to a custom flotation mill near Patagonia; and shipped 105 tons of copper ore to the smelter at El Paso, Tex. Zinc-lead-copper ore (683 tons) was produced also from the Pride of the West mine and treated in a custom flotation mill. The rest of the district output was mainly 67 tons of lead ore and slag shipped from the Mowry property and 47 tons of zinc-lead-copper ore produced from the Happy Thought mine.

Tyndall District.—In 1949 six mines in the Tyndall district produced 541 tons of ore containing 13 ounces of gold, 2,096 ounces of silver, 15,398 pounds of copper, 82,641 pounds of lead, and 45,546 pounds of zinc. Zinc-lead-copper ore (218 tons) was produced from the Compadre and Royal Blue mines; zinc-lead ore (161 tons) from the Glove and Jefferson mines; and lead ore (137 tons) from the Amado, Jefferson, and Wilkins properties. In addition to zinc-lead-copper ore, the Compadre mine also produced 25 tons of zinc ore.

YAVAPAI COUNTY

Agua Fria District.—Operators of two mines—Copper Queen and Stoddard—shipped 527 tons of high-silica copper ore to the United Verde smelter at Clarkdale.

Big Bug District.—In 1949 the Big Bug district ranked second in gold and zinc production in the State, third in silver, and fourth in lead. The Iron King mine of the Shattuck Denn Mining Corp. continued to be the principal producer; output was 175,111 tons of zinc-lead-iron ore, 346 tons of gold-silver ore, and 1,395 tons of gold-iron tailings. The zinc-lead-iron ore, which averaged 0.124 ounce of gold and 4.215 ounces of silver to the ton, 0.162 percent copper, 2.422 percent lead, 6.754 percent zinc, and 22 percent iron, was treated in the company 670-ton flotation mill, as well as 923 tons of custom ore. The mill yielded 13,455 tons of lead concentrate, 16,272 tons of zinc concentrate, and 15,067 tons of iron-gold concentrate. Additional equipment installed in the mill during the year increased the capacity from 470 tons of ore a day to 670 tons.

The remainder of the district lode output was largely 128 tons of copper ore produced from the Henrietta, Lone Pine, and Spar & Durant mines and 102 tons of gold ore from the M. & W., Silverton-Gopher, and Up Shot groups. Placer gold (54 ounces) was recovered from the Jane, Shanks, and Nelson-Fitch properties.

Black Canyon District.—Gold ore (400 tons) produced from the French Lilly group near Cleator was treated by flotation. The rest of the district output was mainly 41 tons of gold-silver ore and 13 tons of gold-lead ore produced from the Golden Turkey mine.

Black Hills District.—A lessee worked the Yaeger waste dump in 1949 and shipped 52 tons of copper ore and 61 tons of old lead slag.

Black Rock District.—Output in 1949 was small lots of gold ore, copper ore, and lead ore produced from various claims and sold to the Wickenburg Ore Market; most of it was 52 tons of copper ore produced from the B. O. A. claim.

Blue Tank District.—E. Nutter continued working the Camp B. mine near Wickenburg, treated 60 tons of copper ore by concentration, and shipped 37 tons of similar ore to a smelter.

Copper Basin District.—The Copper Basin group, formerly known as Commercial mine, was operated under lease by Fred D. Schemmer, who shipped 3,818 tons of high-silica copper ore to the United Verde smelter at Clarkdale. The remainder of the district output was principally 89 tons of zinc-lead ore produced from the "U. S. Navy" mine.

Eureka (Bagdad) District.—Output in 1949 was mainly 1,058,311 tons of copper ore produced from the open pit at the Bagdad mine, 13,640 tons of zinc-lead-gold ore from the Hillside mine, 8,808 tons of zinc-copper ore from the Old Dick mine, and 2,006 tons of zinc ore from the Copper King mine. The Bagdad Copper Corp. worked the Bagdad open pit continuously and treated ore averaging 1.009 percent copper in its 3,000-ton flotation mill. Mining and milling of ore, averaging 0.10 ounce of gold and 2.20 ounces of silver to the ton, 1.01 percent lead, and 1.98 percent zinc, from the Hillside mine by the Hillside Mining & Milling Co. were carried on throughout the year. The Old Dick mine produced 8,808 tons of zinc-copper ore and 220 tons

of copper ore; the zinc-copper ore, which contained 51 ounces of gold, 4,913 ounces of silver, 600,300 pounds of copper, 55,290 pounds of lead, and 3,834,630 pounds of zinc, was shipped to custom mills in Arizona and Utah for treatment. Zinc ore produced from the Copper King mine contained 15 ounces of gold, 4,272 ounces of silver, 79,852 pounds of copper, 69,498 pounds of lead, and 1,141,656 pounds of zinc. Other producers included the Pinafore (407 tons of zinc-copper ore and 6 tons of copper ore); Attempt (36 tons of lead ore); and Vidano No. 3 (34 tons of lead ore).

Hassayampa (Groom Creek, Hassayampa River, Senator, Prescott) District.—In 1949 the output of the Hassayampa district consisted largely of 279 tons of gold-lead ore produced from the Bodie mine, 192 tons of zinc-lead ore from the Cash, Ruth, Sacramento, and Senator properties, 109 tons of gold ore from the Cash, Gold Charm, and Senator properties, and 47 tons of silver ore from the Mark Twain claim.

Lynx Creek District.—Dragline dredging at the Fitzmaurice placer near Prescott from February 20 to June 20 by the Minona Mining Co. recovered 365 fine ounces of gold and 52 fine ounces of silver.

Martinez (Congress) District.—Lessees, operating at the old Congress mine, shipped 62 tons of gold ore.

Minnehaha District.—High-grade silver ore (19 tons) was produced in 1949 from the Little Joker claim 9 miles southeast of Wagoner.

Pine Grove (Crown King) District.—E. M. Moores, Jr., worked the Gladiator and War Eagle mines in 1949 and shipped 366 tons of ore containing 209 ounces of gold, 1,550 ounces of silver, and 3,350 pounds of copper. The rest of the district output was 31 tons of gold-lead ore produced from the Del Pasco group.

Tiger District.—The Tiger mine, 5 miles southwest of Crown King, was worked only the first quarter of the year by the Golden Crown Mining Co.; 700 tons of zinc-lead-silver ore were treated in the Crown King flotation mill. The remainder of the district output was chiefly 57 tons of high-grade gold ore produced from the Arizona Mascot, Camp Bird, and Pilgrim properties.

Tip Top (Rock Springs) District.—Output in 1949 was 163 tons of copper ore produced from the Kay mine by the Black Canyon Copper Co., Inc.

Verde (Jerome) District.—A notable production of zinc was made in the Verde district in 1949, owing to a full year's operation of the zinc-copper ore body at the United Verde mine of the Phelps Dodge Corp.; and substantial increases were recorded in the production of gold, silver, and copper. However, copper ore from the mine remained the most important output in the district, although production declined 11 percent from that in 1948. The corporation reported that 297,161 tons of copper ore and 111,290 tons of zinc-copper ore were produced in 1949 compared with 332,924 and 14,235 tons, respectively, in 1948. All the zinc-copper ore and 132,950 tons of copper ore were treated in the corporation 2,100-ton flotation mill. The copper concentrate (85,496 tons), along with 164,211 tons of crude copper ore and 175 tons of copper precipitates, was shipped direct to the corporation smelter at Clarkdale. The zinc concentrate (10,384 tons) was shipped to a zinc smelter at Dumas, Tex.

According to the annual report of the corporation for 1949, the United Verde branch produced 34,477,880 net pounds of copper in 1949 compared with 29,833,400 net pounds in 1948, and 8,005,488 pounds of zinc were recovered. No important ore discoveries were made, and because of exhaustion of copper ore reserves it is probable that mining will be discontinued in 1951.

The remainder of the district output was 2,156 tons of siliceous ore and 10 tons of copper precipitates shipped to the smelter at Clarkdale from the Verde Exploration property; the ore averaged 0.336 ounce of gold and 2.149 ounces of silver to the ton and 2.174 percent copper.

Walker District.—In 1949 seven mines in the Walker district produced 499 tons of ore containing 170 ounces of gold, 1,660 ounces of silver, 2,409 pounds of copper, 71,030 pounds of lead, and 90,562 pounds of zinc. The New Strike and Pine Mountain properties produced 310 tons of zinc-lead ore and the Forshada claim 99 tons of zinc-lead ore and 71 tons of lead ore. The remainder of the district output was chiefly 17 tons of high-grade gold-lead ore produced from the Emma and Oro Plata claims.

YUMA COUNTY

Castle Dome District.—About 450 tons of oxide lead ore were produced from the Big Jim and DeLuce properties in 1949 and treated in small gravity-concentration mills. The rest of the district output was mainly small lots of high-grade lead ore produced from various prospects and sold to the Wickenburg Ore Market.

Cienega District.—The Empire-Arizona group, 12 miles northeast of Parker, was worked all year by the Lucky Tiger Combination Gold Mining Co.; 1,613 tons of ore were shipped containing 363 ounces of gold, 203 ounces of silver, and 80,871 pounds of copper. The remainder of the district output was principally 128 tons of gold-copper ore produced from the Billy Mack and Golden Ray mines and 79 tons of copper ore from the Mammon and Sue mines.

Ellsworth (Harqua Hala) District.—Output in 1949 was mostly 49 tons of copper ore produced from the Mickey Doolan and Yuma Copper properties and 48 tons of gold ore from the Bettle No. 1 claim.

Eureka (Silver Camp) District.—Zinc-lead ore (1,740 tons) from the waste dump at the Red Cloud mine was treated in a 20-ton concentration mill, and small lots of lead ore were produced from the Black Jack and Horse Shoe claims.

Plomosa District.—The Southern Cross Mining Corp. worked the Lucky Lead group near Bouse and shipped 406 tons of ore containing 9 ounces of gold, 1,668 ounces of silver, and 142,261 pounds of lead. The rest of the district lode output was mainly 118 tons of silver-lead ore produced from the R. & A. mine and 40 tons of gold-copper ore from the Coronation group. Dragline dredging at the N. R. A. placer near Quartzite recovered 50 fine ounces of gold and 10 fine ounces of silver.

California

Gold, Silver, Copper, Lead, and Zinc

(MINE REPORT)

By R. B. Maurer

GENERAL SUMMARY

CALIFORNIA lead production in 1949 reached a level exceeded only in the war year 1917. Despite production curtailments at zinc mines after midyear, output of the metal surpassed 1948 yield by a substantial margin, reversing the downward trend begun in 1946. Due to notably lower output from placer mines, gold production in 1949 fell short of the 1948 level, whereas silver and copper—largely byproduct metals in 1949—were both above their respective 1948 outputs. The total value of the five metals in 1949 was $20,616,562, or nearly 2 percent above 1948. It was divided among the metals as follows: Gold, 71 percent; lead, 16 percent; zinc, 9 percent; silver, 3 percent; and copper, 1 percent. Comparing 1949 with 1948, gold decreased 1 percent in quantity and value; silver increased 8 percent in quantity and value; copper increased 35 percent in quantity and 22 percent in value; lead increased 13 percent in quantity but decreased a fraction of 1 percent in value; and zinc increased 35 percent in quantity and 26 percent in value. Inyo County was the largest contributor to metal-mining output in California, due largely to lead and zinc production as well as to note-worthy quantities of gold, silver, and copper; the county supplied 24 percent of the State total value of the five metals. Nevada County ranked second in 1949, largely from gold ore mined in the Grass Valley-Nevada City district, and produced 19 percent of the total value of the five metals. Sacramento County, which occupied second place in 1948, contributed 18 percent of the total value of the five metals in 1949, mainly from large-scale gold dredging in the Folsom district. Thus, 61 percent of the State output was centered in 3 of the 58 counties.

All tonnage figures are short tons and "dry weight"; that is, they do not include moisture.

Yardage figures used in measuring material treated in placer operations are "bank measure"; that is, the material is measured in the ground before treatment.

The value of metal production reported herein has been calculated at the following prices.

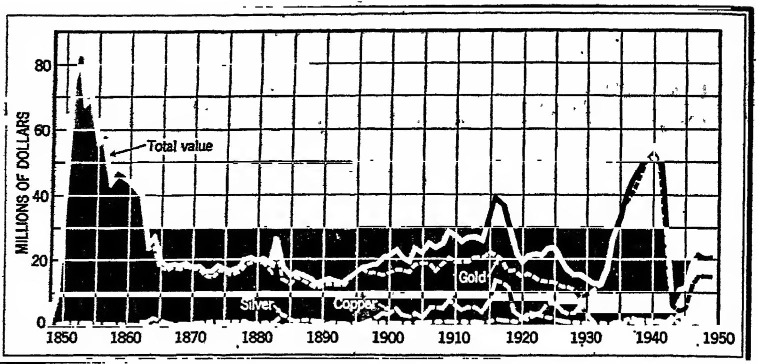

FIGURE 1.—Value of mine production of gold, silver, and copper, and total value of gold, silver, copper, lead, and zinc in California, 1848–1949. The value of lead and zinc has exceeded $1,000,000 in only a few years.

Prices of gold, silver, copper, lead, and zinc—1945–49

Year	Gold [1] (per fine ounce)	Silver [2] (per fine ounce)	Copper [3] (per pound)	Lead [3] (per pound)	Zinc [3] (per pound)
1945	$35.00	$0.711+	$0.135	$0.086	$0.115
1946	35.00	.808	.162	.109	.122
1947	35.00	.905	.210	.144	.121
1948	35.00	.905+	.217	.179	.133
1949	35.00	.905+	.197	.158	.124

[1] Price under authority of Gold Reserve Act of Jan. 31, 1934. Treasury legal coinage value of gold from Jan. 18, 1837 to Jan. 31, 1934, was $20.67+($20.671835) per fine ounce.
[2] Treasury buying price of newly mined silver. 1945 to June 30, 1946: $0.71111111; July 1, 1946, to Dec. 31, 1947: $0.905; 1948–49: $0.9050505.
[3] Yearly average weighted price of all grades of primary metal sold by producers. Price in 1945–47 includes bonus payments by Office of Metals Reserve for overquota production.

Gold.—Production of gold (including a relatively small quantity in "natural gold" and amalgam sold in the open market) from California mines in 1949 was 1 percent below the 1948 output, owing to a 12-percent (35,008-ounce) reduction in yield from placer operations—principally bucket-line dredging—in contrast to a 23-percent (30,766-ounce) increase in lode-gold output. The Empire Star Mines, Ltd., mines in Nevada and Yuba Counties and the Idaho Maryland Mines Corp. properties in Nevada County, largely lessee-operated, and the Central Eureka Mining Co. in Amador County, which effected operational savings by new wage agreements, were able to increase gold output substantially in 1949 despite the fixed price for the metal. The low monthly output in January was followed by fluctuating production from February through November, but a trend toward increasingly larger average monthly yield was evident; maximum monthly output for the year was attained in December.

The 20 leading gold-producing mines in California in 1949, listed in an accompanying table, yielded 89 percent of the total gold, the 5 leaders producing 61 percent.

Mine production of gold, silver, copper, lead, and zinc in California, 1945–49, and total, 1848–1949, in terms of recoverable metals

Year	Mines producing [1]		Ore, old tailings etc. (short tons)	Gold (lode and placer)		Silver (lode and placer)	
	Lode	Placer		Fine ounces	Value	Fine ounces	Value
1945	87	99	717,969	147,938	$5,177,830	986,798	$701,723
1946	150	172	627,767	356,824	12,488,840	1,342,651	1,084,862
1947	210	210	648,789	431,415	15,099,525	1,597,442	1,445,685

[1] For historical data by years, see Minerals Yearbook, Review of 1940, p. 219.

[2] Excludes itinerant prospectors, snipers, high-graders, and others who gave no evidence of legal right to property.

[3] Includes all placer operations using suction pump for delivering gravel to floating washing plants except those producing less than 100 ounces of gold, which are included with "small-scale hand methods."

[4] Includes all placer operations using power excavator and washing plant, both on dry land; when washing plant is movable, outfit is termed "dry-land dredge."

[5] Includes all operations in which hand labor is principal factor in delivering gravel to sluices, long toms, dip boxes, pans, rockers, dry washers, etc.

[6] Complete data not available.

Twenty leading gold-producing mines and 10 leading silver-producing mines in California in 1949, in order of output

Rank	Mine	District	County	Rank in 1948	Operator	Source of metal
		GOLD-PRODUCING MINES				
1	Natomas	Folsom	Sacramento	1	Natomas Co	Dredge.
2	Idaho and Brunswick units	Grass Valley-Nevada City	Nevada	3	Idaho MarylandMines Corp	Gold ore.

[1] Did not produce in 1948.

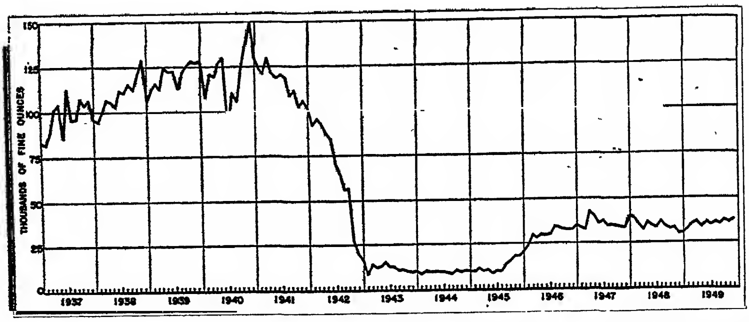

FIGURE 2.—Mine production of gold in California, 1937–49, by months, in terms of recoverable gold.

Silver.—Of California's total recoverable silver in 1949, nearly 88 percent was derived from base-metal ores and 12 percent from precious metal ores and gravels; less than 1 percent was recovered from straight silver ore. The 10 leading silver-producing mines listed in an accompanying table yielded 90 percent of the State total silver in 1949; the three leading mines yielded 73 percent.

The combined output from Anaconda Copper Mining Co. Darwin group of mines, Coso district, Inyo County, and Shoshone group of mines, Resting Springs district, Inyo County, establishes the trend in State silver production as shown by months in 1949.

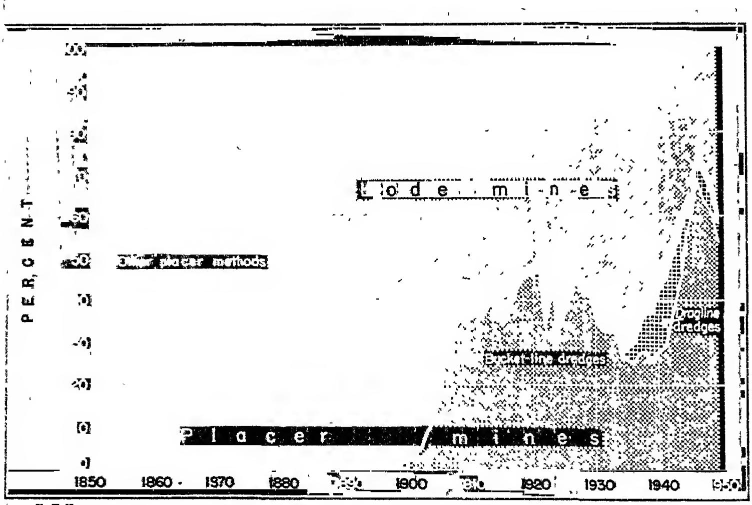

FIGURE 3.—Percentage of total California gold produced at lode and placer mines and by various methods of placer mining, 1850–1949.

Mine production of gold, silver, copper, lead, and zinc in California in 1949, by months, in terms of recoverable metals

Month	Gold (fine ounces)	Silver (fine ounces)	Copper (short tons)	Lead (short tons)	Zinc (short tons)
January	30,522	62,090	78	805	614
February	32,471	73,047	71	1,001	818
March	35,069	72,525	109	930	1,077
April	36,044	81,968	67	877	963
May	33,210	78,382	80	849	831
June	35,622	65,808	64	901	641
July	34,396	30,096	27	444	96
August	35,494	30,069	35	350	158
September	34,658	54,973	30	702	293
October	36,921	80,616	35	1,108	654
November	35,596	75,457	24	1,121	528
December	37,228	78,849	29	1,230	536
Total: 1949	417,231	783,880	649	10,318	7,209
1948	421,473	724,771	481	9,110	5,325

Copper.—As in 1948, the copper produced in California in 1949 was largely a byproduct of ores mined primarily for other metals. The leading producers of copper in the State were the Coronado Copper & Zinc Co. Afterthought mine, Cow Creek district, Shasta County (zinc ore); United States Vanadium Corp. Pine Creek mine, Bishop district, Inyo County (tungsten ore); and Anaconda Copper Mining Co. Darwin group, Coso district, Inyo County (zinc-lead and lead ores).

Lead.—Lead output of 20,636,000 pounds in 1949 was the largest since 1917, the peak year. The State production, associated with zinc, was centered in the Coso and Resting Springs districts of Inyo County, and the monthly production figures in an accompanying table follow a trend allied to the two leading lead-producing mines in the State—the Anaconda Copper Mining Co. Darwin and Shoshone properties. Cessation of operations at the Darwin group in July, August, and part of September, following reduction of lead prices in June, is reflected in the State total yield of the metal. Increased output of lead from October through December resulted from expanded production at both the Darwin and Shoshone groups. Other important producers in California, in order of recoverable lead output, were: Coronado Copper & Zinc Co. Afterthought mine, Cow Creek district, Shasta County; and Foreman & Skinner Defense mine and Finley & Vignich Minnietta mine, Modoc district, Inyo County. Data on a lead-zinc mine were published.[1]

Zinc.—State zinc production in 1949 was kept at a relatively high level from January through May by the yield from the two leading mines—Anaconda Copper Mining Co. Darwin group and Coronado Copper & Zinc Co. Afterthought mine—augmented by the output of the Carbonate King zinc mine,[2] Ivanpah district, Inyo County, and some recoverable zinc from the Anaconda Shoshone group and small producers. The impact of zinc price reductions in June was felt immediately, and by July California's two leading zinc mines had

[2] Wiebelt, Frank J., Investigation of Carbonate King Zinc Mine (Crystal Cave Group), San Bernardino County, Calif.: Bureau of Mines Rept. of Investigations 4522, 1949, 10 pp.

ceased operations. Zinc production in August was increased slightly by larger output from the Penn Chemical Co. Penn mine, Campo Seco district, Calaveras County. Anaconda Copper Mining Co., the State's sole zinc producer operating at the close of 1949, resumed mining and milling at its Darwin group in September, and normal production was maintained from October through December.

MINE PRODUCTION BY COUNTIES

Mine production of gold, silver, copper, lead, and zinc in California in 1949, by counties, in terms of recoverable metals

[1] Excludes itinerant prospectors, snipers, high-graders, and others who gave no evidence of legal right to property.
[2] Combined to avoid disclosure of individual output.
[3] Yuba County lode gold and lode silver included with Nevada County.

MINING INDUSTRY

The 6-percent decrease in total tonnage of ores and old tailings treated in 1949 compared with 1948 reflected a marked decrease in dry ores and an increase in all base-metal ores except zinc-lead ore. The yardage at placer mines decreased 11 percent. The output of lode gold advanced 23 percent; but the gold from this source comprised only 40 percent of the State total, whereas production from placer mines decreased 12 percent and represented 60 percent of the total. The average recoverable gold content of gravel decreased 1 percent.

Dredges of the bucket-line type washed 95 percent of the total gravel mined in the State in 1949 and recovered 91 percent of the total placer gold. Productivity of dragline dredging declined in 1949; equipment of this type washed 3 percent of the total gravel handled and recovered 6 percent of the placer gold. Eleven suction dredges operated in 1949 compared to 6 in 1948 and more nonfloating washing plants (used in conjunction with mechanical excavators) were worked in 1949 than the previous year. In contrast, the number of properties mining gravel and recovering gold largely by hand methods decreased in 1949.

ORE CLASSIFICATION

Of the 494,906 tons of ore (including 2,949 tons of old tailings) sold or treated in 1949, 76 percent was gold ore and old tailings, more than 11 percent zinc-lead ore, 8 percent lead ore, 4 percent zinc ore, and nearly 1 percent gold-silver ore, silver ore and old tailings, copper ore, and lead-copper ore combined. Details of ore classification are given in the Gold and Silver chapter of this volume.

Ore and old tailings sold or treated in California in 1949, with content in terms of recoverable metals

Source	Material sold or treated		Gold (fine ounces)	Silver (fine ounces)	Copper (pounds)	Lead (pounds)	Zinc (pounds)
	Ore (short tons)	Old tailings (short tons)					
Dry gold ore	373,532	949	161,690	59,108	92,000	5,200	
Dry gold-silver ore	2,305		387	13,916	400	19,000

Total: 1949	[1] 491,957	2,949	[2] 417,231	[3] 783,880	[4] 1,298,000	20,636,000	14,418,000
1948	[1] 515,893	10,883	[2] 421,473	[3] 724,771	[3] 962,000	18,220,000	10,650,000

[1] Excludes tungsten ore.
[2] Includes metal recovered from tungsten ore.
[3] Includes metal recovered from tungsten ore and pyritic ore (residue).
[4] Includes metal recovered from tungsten ore and pyritic ore (residue); also includes 60,100 pounds from precipitates and 2,000 pounds from furnace matte.

METALLURGIC INDUSTRY

During 1949, 94 percent of the total ore and old tailings handled was treated at mills, and 6 percent was shipped for direct smelting. Of the 23,289 tons of concentrates (22,156 tons in 1948) received by smelters, 49 percent was zinc concentrate, 38 percent lead concentrate, 8 percent lead-copper concentrate, nearly 3 percent gold concentrate, and 2 percent copper concentrate. A negligible quantity of silver concentrate was smelted. The tonnage of crude ore and old tailings smelted decreased 18 percent, whereas the quantity of ore and old tailings milled decreased 5 percent.

Companies producing most of the State lode gold and those mines that concentrated the bulk of California's base-metal ores operated their own metallurgical plants. Included with the few mills that did receive custom ore were: Burton Bros. Inc., Rosamond (treatment by cyanidation), and Butte Lode Mining Co., Randsburg (amalgamation), both in Kern County; and the Reward mill (Walter Wilson), Independence, Inyo County (concentration). The Empire Star Mines Co., Ltd., Grass Valley, Nevada County, cyanided small lots of concentrates and milled small tonnages of gold ore. The lead plant of the American Smelting & Refining Co. at Selby, Contra Costa County—the State's only smelter treating principally nonferrous primary materials—operated from January to late in November 1949 when a labor dispute resulted in a strike which closed the operation December 1. Metallurgical data on gold and zinc ores were published.[3]

Mine production of metals in California in 1949, by methods of recovery, in terms of recoverable metals

Method of recovery	Gold (fine ounces)	Silver (fine ounces)	Copper (pounds)	Lead (pounds)	Zinc (pounds)
Amalgamation	98,630	19,594			
Cyanidation	55,728	43,554			
Concentrates smelted	7,437	413,509	975,300	10,099,600	12,738,600
Ore and old tailings smelted	4,888	289,426	262,600	10,536,400	1,679,400
Precipitates smelted			60,100		
Placer	250,548	17,797			
Total: 1949	417,231	783,880	1,298,000	20,636,000	14,418,000
1948	421,473	724,771	962,000	18,220,000	10,650,000

[1] Recovered from precipitates.
[2] Content of copper ore from San Bernardino County includes gold, silver, and copper from furnace matte not included with material shipped.
[3] Content of copper ore from Shasta County includes silver and copper from pyritic ore (residue) not included with material shipped.
[4] Includes 56,600 pounds contained in precipitates.

REVIEW BY COUNTIES AND DISTRICTS

AMADOR COUNTY

East Belt District.—Garibaldi Bros. recovered 27 ounces of gold and 3 ounces of silver from 1,100 cubic yards of material handled by drag-line and trommel at the Garibaldi mine from November 15 to December 24, 1949. Logomarsino Bros., lessees, hydraulicked the Union Flat mine from March 1 to May 28, 1949; 2,000 cubic yards of gravel washed yielded 25 ounces of gold and 2 ounces of silver.

Mother Lode District.—Central Eureka Mining Co. worked the Old Eureka mine throughout 1949. Most of the concentrate produced from gold ore treated at the company 150-ton flotation mill was cyanided; a small tonnage was shipped to a smelter. Free gold collected in jigs and bowls was amalgamated.

BUTTE COUNTY

Butte Creek District.—Lancha Plana Gold Dredging Co. operated its Yuba-type bucket-line dredge No. 5 on Butte Creek from January 1 to March 28, 1949.

Oroville District.—Yuba Consolidated Gold Fields, Butte unit, operated two bucket-line dredges throughout the year and one dredge 1½ months of 1949 on land adjoining the Feather River. Gold Hill Dredging Co. operated its electrically powered bucket-line dredge throughout 1949 on the east side of the Feather River 7 miles south of Oroville.

CALAVERAS COUNTY

Campo Seco District.—Penn Chemical Co. operated the Penn mine and 50-ton flotation mill from May 11 to October 31, 1949; 6,639 tons of zinc ore yielded 51 tons of bulk concentrate, containing 6 ounces of gold, 870 ounces of silver, 10,683 pounds of copper, 8,706 pounds of lead, and 25,381 pounds of zinc; 884 tons of zinc concentrate containing 58 ounces of gold, 10,039 ounces of silver, 82,430 pounds of copper, 40,202 pounds of lead, and 816,570 pounds of zinc; and 5 tons of jig concentrate containing 195 ounces of gold, 126 ounces of silver, 193 pounds of copper, 667 pounds of lead, and 66 pounds of zinc. The concentrates were shipped to smelters.

East Belt District—Blackstone Mine (L. A. Sanchez) worked the Blackstone mine and 50-ton mill throughout 1949. Gold and silver were recovered from 1,950 tons of gold ore amalgamated, and 50 tons of flotation and table concentrate shipped to a smelter yielded gold, silver, and some lead. Other lode-gold mines operated during 1949 included the Centennial, Lockwood, Smith, and Soap Root.

Jenny Lind District.—Joe Paltor and others leased the Royal mine from July 1 to December 31, 1949. A substantial quantity of gold and some silver were recovered by amalgamation at the company 10-stamp mill and from flotation concentrate shipped to a smelter.

[1] Only those districts are shown separately for which Bureau of Mines is at liberty to publish figures; other producing districts are listed in footnote 19 and their output grouped as "Other districts."

[2] Excludes itinerant prospectors, snipers, high-graders, and others who gave no evidence of legal right to property.

[3] Sources of total silver as follows: 766,083 ounces from lode mines and 17,797 ounces from placer mines.

[4] Camanche district lies in Amador and San Joaquin Counties.

[5] East Belt district lies in Amador, Calaveras, El Dorado, Mariposa, and Tuolumne Counties.

[6] Mother Lode district lies in Amador, Calaveras, El Dorado, Mariposa, and Tuolumne Counties.

[7] From property not classed as a mine.

[8] Included with "Other districts."

[9] West Belt district lies in Calaveras, El Dorado, and Mariposa Counties.

[10] Friant district lies in Fresno and Madera Counties.

[11] Chidago district lies in Inyo and Mono Counties.

[12] Randsburg district lies in Kern and San Bernardino Counties.

[13] Chowchilla River district lies in Madera and Merced Counties.

[14] Exclusive of placer output which is included with "Other districts."

[15] Includes Browns Valley district (lode), Yuba County.

[16] Folsom district lies in Placer and Sacramento Counties.

[17] Exclusive of lode output which is included with "Other districts."

[18] Combined with Grass Valley-Nevada City district (lode) in Nevada County to avoid disclosure of individual output.

[19] Includes following: Sterling district (placer) in Butte County; Orleans (placer) in Humboldt County; Slate Range (lode) and Ubehebe (lode) in Inyo County; Chowchilla River (Raymond) [13] (placer) and Friant [10] (placer) in Madera County; Hunter Valley (placer) in Mariposa County; Snelling (placer) in Merced County; Los Burros (lode) in Monterey County; Masonic (lode) in Mono County; Ralston Divide (placer) in Placer County; Edmanton (placer) in Plumas County; Cow Creek (lode), Flat Creek (lode), Redding (placer), and Shasta (lode) in Shasta County; Alleghany (lode) and Downieville (lode) in Sierra County; Callahan (placer) in Siskiyou County; La Grange (placer) in Stanislaus County; Big Bar (placer) in Trinity County; and Yuba River (placer) in Yuba County.

[20] Excludes tungsten ore.

[21] Includes metal recovered from tungsten ore.

[22] Includes metal recovered from tungsten ore and pyritic ore (residue).

[23] Includes metal recovered from tungsten ore and pyritic ore (residue); also includes 60,100 pounds contained in precipitates and 2,000 pounds in furnace matte.

Mine production of gold, silver, copper, lead, and zinc in California in 1949, by counties and districts, in terms of recoverable metals [1]—Continued

EL DORADO COUNTY

East Belt District.—Cosumnes Mines, Inc., developed the Cosumnes mine from April 1 to December 31, 1949. Most of the concentrate produced from 275 tons of gold ore milled at its 60-ton flotation mill was cyanided at a custom mill; some concentrate was shipped to a smelter.

Mother Lode District.—Lord & Bishop operated a dragline and fuel-oil-powered Bodinson floating washing plant on Greenwood Creek in December 1949; 106 ounces of gold and 13 ounces of silver were recovered from 14,000 cubic yards of gravel washed on the David property. E. B. Matherly worked his suction dredge 820 hours during 1949 on the American River and recovered 84 ounces of gold from 5,200 cubic yards of gravel. River Pine Mining Co., Ltd., operated a dragline dredge on the Middle Fork of the Cosumnes River from August 23 to December 31, 1949; Twin Forks Dredging Co. operated similar equipment on the North Fork of the Cosumnes River from June through December 1949. Volo Mining Co. worked the Shaw mine in 1949, recovering gold and silver from ore amalgamated at the company mill. In addition, flotation concentrates were shipped to a custom-cyanide mill and to a smelter.

West Belt District.—Lord & Bishop operated a dragline and Bodinson washing plant on Carson Creek from January 15 to April 15, 1949; 71,000 cubic yards of gravel treated yielded 458 ounces of gold and 48 ounces of silver.

FRESNO COUNTY

Friant District.—Pacific Coast Aggregates, Inc., recovered gold and some silver incident to operation of its Rockfield commercial rock and gravel plant.

HUMBOLDT COUNTY

Orleans District.—Pearch Mining Co., hydraulicked the Pearch mine from February 1 to June 15, 1949; Fred Ray and Luthena White purchased the lease October 20, 1949.

INYO COUNTY

Bishop (Bishop Creek) (Pine Creek) District.—The United States Vanadium Corp. worked the Pine Creek mine throughout 1949 and produced by flotation a copper concentrate (containing a substantial quantity of silver and some gold) as a byproduct from ore treated primarily for tungsten.

Cerro Gordo District.—Sierra Ventura Mines, Inc., worked the Ventura mine from February 4 to August 1, 1949; 21 tons of screenings with a gross metal content of 26 ounces of silver, 42 pounds of copper, 2,293 pounds of lead, and 2,038 pounds of zinc were shipped to a concentrator-smelter. Santa Rosa Mining Co. operated the Santa Rosa mine during 1949 and shipped lead ore to a smelter.

Coso District.—Joe McCulley developed the Empress group throughout 1949; 91 tons of ore containing 1 ounce of gold, 726 ounces of silver, 3,699 pounds of copper, 39,329 pounds of lead, and 12,388 pounds of zinc were shipped to a smelter. Anaconda Copper Mining Co.

worked the Darwin group of mines (the largest producer of silver, lead, and zinc in California) from January 1 through June 18, 1949. Operations were resumed September 16 and continued until the end of the year. The lead concentrate and zinc concentrate produced from the zinc-lead sulfide ore treated at the company 300-ton flotation mill were shipped to smelters. In addition, lead ore was shipped for direct smelting. Frank & Weslyn Wiece, Jack Hoppe, and Bert Quinn worked the Silverspoon mine during 1949; 158 tons of zinc-lead ore (containing 2 ounces of gold, 397 ounces of silver, 403 pounds of copper, 56,319 pounds of lead, and 28,124 pounds of zinc) and 37 tons of lead ore (containing 143 ounces of silver and 8,487 pounds of lead) were shipped to smelters.

Kearsarge (Waucoba) District.—W. Denman & E. Carlson worked the Nancy Hanks mine for 3 months in 1949; 27 tons of lead ore shipped to a smelter contained 233 ounces of silver, 12 pounds of copper, and 13,961 pounds of lead.

Modoc District.—Finley & Vignich worked the Minnietta mine throughout 1949; 861 tons of lead ore shipped for direct smelting contained 5 ounces of gold, 4,483 ounces of silver, 405 pounds of copper, and 382,386 pounds of lead. In addition, 13 tons of table concentrate (containing 1 ounce of gold, 749 ounces of silver, 30 pounds of copper, and 8,387 pounds of lead) produced from tailings were shipped to a smelter. Foreman & Skinner operated the Defense mine from January to July 1949. Lead ore containing a substantial quantity of silver and some gold and copper was shipped to a smelter.

Resting Springs District.—Anaconda Copper Mining Co. operated the Shoshone group of mines (second-largest producer of silver and lead in the State) throughout 1949. Sulfide flotation of the lead ore followed by flotation of oxidized lead minerals yielded a lead concentrate containing some gold, silver, copper, and zinc. The concentrate and lead ore (containing substantial quantities of gold and silver and some copper and zinc) were shipped to a smelter.

South Park District.—Harry E. Briggs shipped 34 tons of zinc-lead ore containing 3 ounces of gold, 159 ounces of silver, 137 pounds of copper, 12,860 pounds of lead, and 15,732 pounds of zinc to a smelter from the Red Cloud mine during 1949.

Ubehebe District.—George Lippincott worked the Lippincott mine throughout 1949. In addition to zinc-lead ore shipped to smelter, 400 tons of lead ore were consigned to the Lippincott blast furnace at Santa Ana, Calif., for treatment. Ubehebe Mines, Inc., worked the Ubehebe mine from January to May 2, 1949; 99 tons of ore shipped to a smelter contained 2 ounces of gold, 311 ounces of silver, 277 pounds of copper, 39,652 pounds of lead, and 11,568 pounds of zinc.

White Mountains District.—Grandview Mining Co. worked the Buster group from April 15 to September 15, 1949; 17 tons of ore containing 125 ounces of silver, 34 pounds of copper, and 2,570 pounds of lead were shipped to a smelter.

KERN COUNTY

Bakersfield District.—C. & H. Materials Co. recovered gold and silver as byproducts from its commercial rock plant on the Kern River.

Mojave District.—Burton Bros., Inc., operated its cyanide mill throughout 1949 on ore from the Cactus Queen, Tropico (Kid, Trailer Wheel), and Middle Buttes mines and, in addition, treated ores from other mines in the Mojave district (including the Standard, Whitmore, Elephant-Eagle, Red Mill No. 2, and Silver King).

Randsburg District.—Butte Lode Mining Co. operated the Butte Lode mine throughout 1949; 505 tons of ore amalgamated at the company mill yielded 81 ounces of gold and 22 ounces of silver. The mill also handled custom ore from neighboring mines, including the Minnesota, Josephine, Hercules, California, and Big Dyke. Mason, Hager & Cole operated a dry-land dredge at the Goler mine from January 10 to February 14; 25 ounces of gold and 4 ounces of silver were recovered from 20,000 cubic yards of gravel.

LOS ANGELES COUNTY

Neenach District.—Antelope Mining Corp. worked the Rogers & Gentry mine from September 28 to November 26, 1949; gold and silver were recovered from 228 tons of ore (some concentrated at the company mill and smelted, and the balance was amalgamated and cyanided at custom mills).

San Gabriel District.—San Gabriel Valley Placers (Robert A. Riggs) recovered 71 ounces of gold and 11 ounces of silver as byproducts of the Azusa Rock & Sand Co. plant.

MADERA COUNTY

Chowchilla River (Raymond) District.—Howell Bros. operated a suction dredge intermittently during 1949 and recovered a substantial quantity of gold and some silver.

Potter Ridge District.—F. Gilman Low and Michael Salonish operated the New Deal mine throughout 1949; 60 tons of ore amalgamated yielded 28 ounces of gold and 6 ounces of silver. Robert C. Jordan dredged the Emerick and Parker properties in 1949, using a suction dredge.

MARIPOSA COUNTY

East Belt District.—J. H. Metzler shipped 4 tons of gold ore containing 3 ounces of gold and 1 ounce of silver to a smelter in 1949 from the Blue Ribbon mine. Other gold mines that operated during the year were: Mexican Diggings (R. H. Jackson), Nutmeg and Permit (Permit Mining Corp.), and Schroeder mine (Schroeder Mines).

Hunter Valley District.—Mount Gaines Mining Co. worked the Mount Gaines mine from January 1 to September 30, 1949, and amalgamated 5,020 tons of gold ore, from which was recovered bullion (containing 1,397 ounces of gold and 430 ounces of silver) and 111 tons of flotation and table concentrate containing 826 ounces of gold and 309 ounces of silver. Thurman & Wright operated its dragline dredge No. 3 on Burns Creek from February 10 to August 6, 1949.

Mother Lode District.—James H. Henry dredged on Bear Creek from January 23 to May 22, 1949, and operated a Diesel-powered dragline and a Henry floating washing plant; 238 ounces of gold and 28 ounces of silver were recovered from 32,335 cubic yards of gravel. Gold ore

from a number of mines worked during 1949 (including the Argo, Combination, Diltz-Oro Grande, Lonesome Pine, Malone, Specimen, and Texas Gulch) was treated by amalgamation.

MERCED COUNTY

Snelling District.—Merced Dredging Co. operated its bucket-line Dredge No. 1 from January 1 until April 17, 1949, when the operation was shut down and the dredge dismantled. Snelling Gold Dredging Co. worked two bucket-line dredges (one the entire year and the other from January 1 to October 10, 1949) adjacent to the Merced River between Snelling and Merced Falls.

MONO COUNTY

Masonic District.—Sarita Mines, Inc., shipped gold ore, with values in silver, from the Sarita mine to a custom-cyanide mill in Nevada during 1949.

NEVADA COUNTY

Graniteville District.—R. Moore and Ed Dunbar worked the 4 D's mine from June 21 to October 7, 1949; 10 tons of ore amalgamated yielded 20 ounces of gold and 21 ounces of silver and 84 tons of gold ore cyanided at a custom mill yielded 23 ounces of gold and 22 ounces of silver.

Grass Valley-Nevada City District.—The Empire Star Mines Co., Ltd., treated ore from the Empire, North Star, and Pennsylvania mines at Grass Valley and the company Browns Valley properties in Yuba County by amalgamation and cyanidation; ore and concentrates from several neighboring properties also were treated at the 500-ton mill and cyanide plant. Idaho-Maryland Mines Corp. worked the Idaho and Brunswick units throughout 1949, treating gold ore by amalgamation followed by cyanidation of concentrates. Stockton Hill mine shipped 867 tons of ore containing 261 ounces of gold to a custom cyanide mill from the Stockton Hill mine in 1949.

Washington (North Bloomfield) District.—Dallas Church worked the Washington Creek (Giant King) mine in 1949 and trucked 221 tons of gold ore containing 29 ounces of gold and 53 ounces of silver to a custom-cyanide mill. Ancho Erie Mining Co. developed the Ancho and Erie groups throughout 1949, treating gold ore in its 200-ton concentrating mill and 6-ton cyanide plant. A. P. Landsburg and Joe Swazey hydraulicked the Relief Hill mine and recovered 120 ounces of gold and 5 ounces of silver from 10,000 cubic yards of gravel. Frank Mellott and associates hydraulicked the Waukashau mine; 116 ounces of gold and 5 ounces of silver were recovered from 6,000 cubic yards of gravel. Goldfield Consolidated Mines Co. hydraulicked the Omega mine, and Crescent Pacific Mining Co. worked the Eastman placer mine during 1949.

PLACER COUNTY

Auburn (Penryn) District.—Mary Len Mine (a partnership) worked the Mary Len mine in 1949; gold ore was amalgamated at the company mill and concentrate shipped to a custom-cyanide plant. Schwartz

& Mitchell operated dragline equipment and a washing plant in Auburn Ravine during 1949.

PLUMAS COUNTY

La Porte District.—R. & M. Mining Co. operated a dragline and Bodinson washing plant on Slate Creek from May to November 1949.

Rich (Virgilia) District.—R. S. Crozen worked the Klau Mines, Inc., Virgilia mine intermittently in 1949; 103 tons of ore amalgamated yielded 15 ounces of gold and 3 ounces of silver.

RIVERSIDE COUNTY

Eagle Mountain District.—Eagle Lead Co. shipped lead ore containing some gold, silver, and copper from the Black Eagle mine to a smelter in 1949.

SACRAMENTO COUNTY

Cosumnes River District.—Mountain Gold Dredging Co. operated a Diesel dragline dredge at Michigan Bar throughout 1949. Cosumnes Gold Dredging Co. operated its bucket-line dredge near Sloughhouse during 1949.

Folsom District.—The Natomas Co., leading California gold producer in 1949, operated seven Natomas-type bucket-line dredges (five units the full year, one unit 9 months, and one unit 2 months) during 1949 on property near the American River. Capital Dredging Co. worked bucket-line dredges No. 3 and No. 4 respectively 12 and 7½ months in 1949, 5 miles south of Folsom. General Dredging Co. operated a Diesel dragline and electric-powered washing plant at Natoma throughout 1949. Lancha Plana Gold Dredging Co. operated bucket-line dredge No. 4 on the American River from January 1 to April 8, 1949. The Fair Oaks Gravel Co. recovered as a byproduct of gravel-washing operations 135 ounces of gold and 9 ounces of silver from 51,296 cubic yards of material handled.

SAN BERNARDINO COUNTY

Buckeye District.—Donald F. Love shipped gold ore from the Roosevelt-Bagdad Chase mine to a smelter in 1949; substantial quantities of gold, silver, and copper were recovered.

Clark Mountain District.—Robert H. Cordill worked the H & H claims from April 28 to July 11, 1949; 5 tons of ore shipped to a smelter contained a trace of gold, 231 ounces of silver, and 68 pounds of copper. Mohawk Mines, Inc., worked the Mohawk mine, and Altana Corp. operated the Wilshire mine of the Mohawk group in 1949; lead ore was shipped to smelters.

Ivanpah District.—New Trail Mining Co. and its successor, Alloy Mining Co., operated the New Trail mine intermittently in 1949; 98 tons of ore shipped to a smelter contained 27 ounces of gold, 429 ounces of silver, and 18,130 pounds of copper. The Carbonate King zinc mine was worked by J. Q. Little under contract from the Crystal Cave Mining Co.; zinc ore containing some gold, silver, and lead was shipped to a smelter.

Randsburg District.—Baird, Martin, Ralston & Ralston worked the Pioneer group from March 1 to December 31, 1949; 387 tons of ore

amalgamated at a custom mill yielded 225 ounces of gold and 61 ounces of silver. Surcease Mining Co. recovered 317 ounces of gold and 63 ounces of silver from 10,543 cubic yards of gravel at the Super Mold property in 1949 by dry-land dredging; in addition, gravel handled chiefly for scheelite at the Spud Patch mine yielded 157 ounces of gold and 24 ounces of silver.

SAN JOAQUIN COUNTY

Camanche District.—The Gold Hill Dredging Co. operated its Lower Comanche bucket-line dredge from January 8 to December 31 and its Upper Comanche dredge from January 1 to January 26, 1949, along the Mokelumne River.

SHASTA COUNTY

Cow Creek District.—The Coronado Copper & Zinc Co., second largest producer of zinc in the State, worked the Afterthought mine from January 1 to June 30, 1949. Zinc concentrate and lead-copper concentrate produced from the zinc ore milled at the company 100-ton plant were shipped to smelters.

Redding District.—Thurman Gold Dredging Co. operated its Yuba-type bucket-line dredge on Clear Creek throughout 1949.

SIERRA COUNTY

Alleghany District.—John O'Donnell worked the Kate Hardy mine in 1949 and recovered 729 fine ounces of gold and 163 fine ounces of silver from 1 ton of high-grade ore. The Original Sixteen to One Mine, Inc., operated its Original Sixteen to One mine throughout 1949, recovering gold and some silver by amalgamation and from gold concentrate shipped to a smelter.

Downieville District.—Brush Creek Mine and Alfred L. Merritt operated the Brush Creek mine in 1949 and recovered a substantial quantity of gold and some silver by amalgamation and from concentrate cyanided at a custom mill. The company mill was destroyed by fire late in December 1949.

SISKIYOU COUNTY

Callahan District.—Yuba Consolidated Gold Fields (Siskiyou unit) operated its Callahan dredge (equipped with 72 9-cubic-foot buckets) throughout 1949 on Scott River.

Deadwood District.—French Gulch Dredging Co. worked its bucket-line dredge on Indian Creek throughout 1949; 5,390 ounces of gold and 755 ounces of silver were recovered from 1,266,243 cubic yards of gravel handled.

Klamath River District.—Reeves Ranch Dredging Co. operated a bucket-line dredge on the Klamath River 1 mile from Happy Camp throughout 1949.

Liberty District.—E. A. McBroom hydraulicked the Farnsworth mine from March throughout June 1949; 2,520 cubic yards of gravel washed yielded 12 ounces of gold and 2 ounces of silver. Other mines hydraulicked in 1949 included the Boulder Gulch group, Emma and Ray groups, Joubert, Webb, and Judge.

STANISLAUS COUNTY

La Grange District.—La Grange Gold Dredging Co. worked its bucket-line dredge No. 4 on the Tuolumne River bottom throughout 1949. Tuolumne Gold Dredging Co. operated a bucket-line dredge for a short period in 1949 but closed down the operation February 14.

TRINITY COUNTY

Coffee Creek District.—Mires & Garner operated the Mires & Underseth bucket-line dredge in 1949.

Hayfork District.—T. C. Kelly worked the Kelly mine 7 months in 1949; gold and silver were recovered by amalgamating the high-grade ore and from ore shipped to a smelter.

Junction City District.—Julian I. Collicott and Elmer Katt recovered 6 ounces of gold and 1 ounce of silver from 500 cubic yards of gravel hydraulicked at the Carr mine. The Goldfield Consolidated Mines Co. and Gilzean Bros., lessees, hydraulicked the Red Hill property throughout 1949.

Lewiston (Minersville) District.—Fairview Placers operated the former Junction City dredge, Yuba-type, electrically powered, equipped with 70 10½-cubic-foot buckets, on Stuart Forks and Trinity River from September 26 to December 31, 1949.

Weaverville District.—Perry T. Bennett hydraulicked the Rex mine during 1949. Other placer properties worked during the year included: Aurora (Robert A. Hall), Brown's Creek (C. O. Arbuckle), and Buckeye Creek and Indian Creek (Terminal Truck Service).

TULARE COUNTY

Lemon Cove District.—Terminus Beach Rock Co., Inc., recovered 26 ounces of gold and 4 ounces of silver from 310,000 cubic yards of material handled at its commercial gravel plant on Kaweah River.

TUOLUMNE COUNTY

East Belt District.—George A. & John W. Miller worked the Golden Star mine from April 1 to June 1, 1949; 5 tons of concentrate smelted (produced from approximately 54 tons of tailings) yielded 7 ounces of gold and 3 ounces of silver. Other mines operated in the district on a small scale during 1949 included: Eureka, Grizzly, Longfellow, and Two Bettys.

Mother Lode District.—Pocket mines that produced gold during 1949, included: Ford (Ralph & Jo Tapley); Farrington (Frank Jancygay); Hidden Treasure (Harry Gibson & H. C. Keenan); and Lucky Strike (E. H. Crabtree and J. P. Katsulakis).

YUBA COUNTY

Browns Valley District.—Empire Star Mines Co., Ltd., and lessees worked the Dannebroge mine during 1949 in conjunction with the company's Nevada County properties.

Yuba River District.—Yuba Consolidated Gold Fields (Yuba unit) operated its fleet of five Yuba-type dredges (all equipped with 18-cubic-foot buckets) on the Yuba River Basin throughout 1949.

Colorado

Gold, Silver, Copper, Lead, and Zinc

(MINE REPORT)

By A. J. Martin

GENERAL SUMMARY

COLORADO'S output of lead and zinc established long-time records in 1949 despite sharp declines in base-metal prices that caused one of the large producers and a number of small-scale operations to shut down before midyear. The production of lead increased 7 percent and of zinc 6 percent in quantity over 1948, making the lead output the highest since 1927 and zinc since 1917. San Miguel and Mineral Counties showed the largest percentage gains among the important-producing counties; Eagle, Lake, and Ouray Counties recorded moderate gains in both lead and zinc and San Juan County in lead. The only large decreases were in Dolores and Gunnison Counties; Summit County had small percentage declines in both metals and San Juan County in zinc. The State production of copper, nearly all derived from ores yielding chiefly lead, zinc, and precious metals, increased 4 percent.

Gold production decreased 34 percent from 1948. Virtually all mining operations in the famous Cripple Creek district shut down in February to await completion of a new custom mill being built there to replace the Golden Cycle mill at Colorado Springs as a market for Cripple Creek ore. Other gold districts either remained inactive or had a low production, and gold output decreased in most of the principal districts producing gold along with silver and base metals. The State silver production decreased slightly and amounted to about half the annual average for the 10-year prewar period 1932–41.

All tonnage figures are short tons and "dry weight"; that is, they do not include moisture.

The value of the metal production reported herein has been calculated at the following prices.

Prices of gold, silver, copper, lead, and zinc, 1945–49

Year	Gold[1] (per fine ounce)	Silver[2] (per fine ounce)	Copper[3] (per pound)	Lead[3] (per pound)	Zinc[3] (per pound)
1945	$35.00	$0.711+	$0.135	$0.086	$0.115
1946	35.00	.808	.162	.109	.122
1947	35.00	.905	.210	.144	.121
1948	35.00	.905+	.217	.179	.133
1949	35.00	.905+	.197	.158	.124

[1] Price under authority of Gold Reserve Act of Jan. 31, 1934. Treasury legal coinage value of gold from Jan. 18, 1837, to Jan. 31, 1934, was $20.67+ ($20.671835) per fine ounce.
[2] Treasury buying price for newly mined silver. 1945 to June 30, 1946: $0.71111111; July 1, 1946, to Dec. 31, 1947: $0.905; 1948–49: $0.9050505.
[3] Yearly average weighted price of all grades of primary metal sold by producers. Price in 1945–47 includes bonus payments by Office of Metals Reserve for overquota production.

Mine production of gold, silver, copper, lead, and zinc in Colorado, 1945–49, and total, 1858–1949, in terms of recoverable metals

Year	Mines producing		Ore sold or treated (short tons)	Gold (lode and placer)		Silver (lode and placer)	
	Lode	Placer		Fine ounces	Value	Fine ounces	Value
1945	195	41	1,357,551	110,935	$3,532,725	2,226,780	$1,583,488
1946	235	28	1,463,496	142,613	4,991,455	2,240,151	1,810,042
1947	290	33	1,544,694	168,279	5,889,765	2,557,653	2,314,676

1858–1949	257,562	69,132,483	2,532,574	261,783,053	1,470,810	236,480,646	2,018,430,552

[1] Figure not available.

Gold and silver produced at placer mines in Colorado, 1945–49, in fine ounces in terms of recoverable metals

Year	Small-scale hand methods [1]		Hydraulic		Gravel mechanically handled: Nonfloating washing plants [2]		Gravel mechanically handled: Bucket-line and drag-line dredges		Total	
	Gold	Silver	Gold	Silver	Gold	Silver	Gold	Silver	Gold	Silver
1945	147	35	49	11	409	72	7,296	1,277	7,901	1,395
1946	89	15			1,047	169	19,036	3,514	20,172	3,698
1947	243	52			930	156	16,400	3,243	17,573	3,451
1948	106	29			662	103	12,479	2,680	13,247	2,812
1949	137	33			775	116	12,231	2,652	13,143	2,801

[1] Includes all operations in which hand labor is principal factor in delivering gravel to sluices, long toms, dip boxes, pans, rockers, dry washers, etc.
[2] Includes all placer operations using power excavator and washing plant, both on dry land; when washing plant is movable, outfit is termed "dry-land dredge."

Gold.—The Colorado output of gold in 1949 was 102,618 fine ounces—a decrease of 52,184 ounces from 1948. The largest decrease was 40,109 ounces in the Cripple Creek district, where nearly all mining was suspended when the Golden Cycle mill at Colorado Springs closed February 20. Mining will be resumed when the new custom mill, under construction at Cripple Creek, is ready to receive ore. The Upper San Miguel district ranked first in gold production, California (Leadville) second, and Cripple Creek third. Dry gold and silver ores yielded 51 percent of the State total gold, zinc-lead and zinc-lead-copper ores 31 percent, placers 13 percent, and other ores 5 percent. The leading gold-producing properties, in order of rank, were: Smug-

gler Union group (Telluride Mines) at Telluride, Treasury Tunnel-Black Bear (Idarado) in San Miguel County, Resurrection at Leadville, Shenandoah-Dives near Silverton, and South Platte Dredging Co. dredge near Fairplay.

Silver.—Production of silver in Colorado in 1949 (2,894,886 fine ounces) decreased 4 percent from 1948. Zinc-lead and zinc-lead-copper ores yielded 44 percent of the State total silver in 1949, dry gold and silver ores 41 percent, and other ores and placer gravel 15 percent. The leading producers of silver were the Treasury Tunnel-Black Bear (Idarado) group in San Miguel County, Shenandoah-Dives group near Silverton, Emperius Mining Co. group at Creede, American Smelting & Refining Co. Kokomo unit (Victory group), and Eagle mine at Gilman.

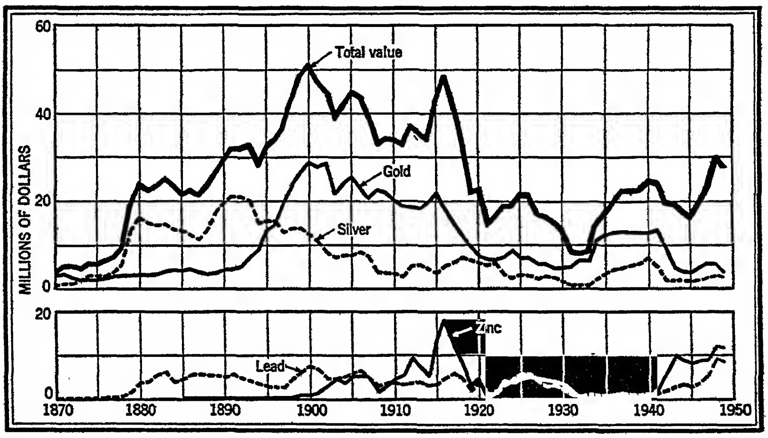

FIGURE 1.—Value of mine production of gold, silver, lead, and zinc and total value of gold, silver, copper, lead, and zinc in Colorado, 1870–1949. The value of copper has been less than $2,000,000 annually, except in a few years.

Copper.—Copper ore yielded only 5 percent of the State output of copper in 1949; the rest was recovered from ores yielding chiefly zinc, lead, or precious metals. The Idarado Mining Co., which makes a copper concentrate from complex gold-silver-copper-lead-zinc ore mined in San Miguel County, was the only substantial Colorado producer of copper.

Lead.—Although the sharp drop in the price of lead caused some Colorado mines to close in 1949, the State output of lead increased for the third successive year and was the highest since 1927. The quantity produced was 26,853 tons compared with 25,143 tons in 1948. San Miguel County contributed 20 percent of the State total lead, Lake County 19 percent, Summit 16 percent, San Juan 13 percent, Eagle 6 percent, Ouray 6 percent, and other counties 20 percent. Zinc-lead and zinc-lead-copper ores yielded more than 64 percent of the total lead, gold and silver ores 20 percent, lead ore 9 percent, and copper, lead-copper, and zinc ores nearly 7 percent. The larger lead-producing mines, in order of rank, were: Victory group at Kokomo (American Smelting & Refining Co.), Resurrection at Leadville, Treasury

Tunnel-Black Bear (Idarado) in San Miguel County, Smuggler Union at Telluride, and Eagle mine at Red Cliff.

Zinc.—The production of zinc in Colorado held at a fairly steady monthly rate throughout 1949 and totaled 47,703 tons (recoverable metal) compared with 45,164 tons in 1948. All the leading zinc producers that were active in 1948 except the Rico Argentine mine in Dolores County operated all of 1949, but a number of the smaller mines closed after the price of zinc began to decline in March. Eagle County produced more than 36 percent of the State total zinc in 1949, Summit County 21 percent, Lake more than 13 percent, San Miguel nearly 13 percent, and other counties 17 percent. Zinc and zinc-lead-copper ores yielded 94 percent of the State total zinc. The leading zinc-producing mines, in order of rank, were: Eagle mine at Gilman, American Smelting & Refining Co. Kokomo unit, Treasury Tunnel-Black Bear (Idarado) in San Miguel County, Resurrection group at Leadville, and Smuggler Union (Telluride mines) at Telluride.

MINE PRODUCTION BY COUNTIES

Mine production of gold, silver, copper, lead, and zinc in Colorado in 1949, by counties, in terms of recoverable metals

County	Mines producing		Gold (lode and placer)		Silver (lode and placer)	
	Lode	Placer	Fine ounces	Value	Fine ounces	Value

MINING INDUSTRY

The quantity of dry gold and silver ores mined in Colorado in 1949 decreased 26 percent from 1948. The mines of the Cripple Creek district shut down when the Golden Cycle mill at Colorado Springs closed in February 1949 and are expected to remain idle until the new Carlton custom mill under construction in the Cripple Creek district is completed and put in operation. Other gold districts either remained idle or had low outputs. About the same quantity of combined lead, zinc, copper, and complex gold-silver-copper-lead-zinc ores were mined as in 1948. The sharp declines in prices of copper, lead, and zinc caused one of the larger producers and a number of small-scale operations to close, but some of the larger producers expanded operations as metal prices declined in order to reduce the cost per ton of ore mined. The 6-day workweek was continued by most of the principal producers. Considerable exploration by diamond drilling, crosscutting, and drifting was carried on by the mining companies in the Aspen, Leadville, and Kokomo (Ten Mile) districts and the San Juan region. The Bureau of Mines did exploratory drilling in Pitkin and San Juan Counties and prepared to resume work on driving the Leadville drainage tunnel begun during the war. Data on the mineral deposits and mining and milling methods in the San Juan region were published.[1] The only important placer operations were the bucket-line dredge in Park County and the two drag-line dredges on the Mount Elbert placers in Lake County.

ORE CLASSIFICATION

Details of ore classification are given in the Gold and Silver chapter of this volume.

Ores sold or treated in Colorado in 1949, with content in terms of recoverable metals

Source	Mines producing	Ore (short tons)	Gold (fine ounces)	Silver (fine ounces)	Copper (pounds)	Lead (pounds)	Zinc (pounds)
Dry gold ore	55	215,357	39,479	177,222	216,237	4,632,815	3,368,962
Dry gold-silver ore	21	224,999	12,027	554,833	402,284	3,217,589	850,819
Dry silver ore	28	66,518	1,110	445,208	205,597	2,765,405	1,500,723
Total	104	506,874	52,616	1,177,263	824,118	10,615,809	5,720,504
Copper ore	1	3,838	296	59,069	233,625	2,105	----------
Lead ore	69	42,750	1,860	221,712	85,626	4,853,012	356,648
Lead-copper ore	1	27	1	444	1,875	11,086	----------
Zinc ore	12	182,665	2,654	147,460	63,239	3,494,175	36,654,470
Zinc-lead ore [1]	68	526,201	32,048	1,286,137	3,597,517	34,729,813	52,674,378
Total	151	755,481	36,859	1,714,822	3,981,882	43,090,191	89,685,496
Total lode mines [2]	255	1,262,355	89,475	2,892,085	4,806,000	53,706,000	95,406,000
Placers	27	----------	13,143	2,801	----------	----------	----------
Total: 1949	282	1,262,355	102,618	2,894,886	4,806,000	53,706,000	95,406,000
1948	294	1,438,119	154,802	3,011,011	4,596,000	50,286,000	90,328,000

[1] Includes zinc-lead-copper ore, for which the Bureau of Mines is not at liberty to publish separate figures.
[2] A mine producing more than 1 class of ore is counted but once in arriving at total for all classes.

METALLURGIC INDUSTRY

The Golden Cycle mill at Colorado Springs, built in 1905–06 and the largest gold-ore-treatment mill in Colorado for more than 25 years, closed February 20, 1949, and was later dismantled. The mill has treated the entire output of ore from the Cripple Creek district and a substantial tonnage from other districts for many years. During 1949 the Golden Cycle Corp. began constructing a new 1,000-ton custom mill at Cripple Creek, to be called the Carlton mill, to replace the Golden Cycle mill as a market for Cripple Creek ore. The treatment method will retain the fundamental (roasting and cyanidation) processes formerly used in the Golden Cycle mill. The main changes will be that all the ore received, instead of only the lower grade, will be concentrated by flotation, and only concentrate will be roasted; the calcines discharged from the roasters will go direct to cyanidation instead of first being passed over blankets to recover free gold for amalgamation; and the new carbon-cyanide process will be used to recover gold from the flotation tailings, all of which will continue to be given a cyanide treatment.

Most of the ores from districts other than Cripple Creek were treated by selective flotation mills, some of which used gold jigs in the ball mill-classifier circuit. Thirty-six Colorado mills, with capacities ranging from 25 to 1,500 tons and averaging about 210 tons, were operated all or part of the year.

The Arkansas Valley smelter at Leadville purchases most of the State siliceous gold-silver and lead concentrates and silver, lead-copper, and lead ores shipped to smelters. Copper concentrates are shipped to the Garfield, Utah, and El Paso, Tex., smelters. Custom mills and smelters in the Salt Lake Valley, Utah, are important as a market for Colorado zinc-lead ores and concentrates. Zinc concentrates are shipped to Amarillo and Dumas, Tex.; Depue, Ill.; Palmerton, Pa.; and Anaconda and Great Falls, Mont.

Mine production of metals in Colorado in 1949, by methods of recovery, in terms of recoverable metals

Method of recovery	Gold (fine ounces)	Silver (fine ounces)	Copper (pounds)	Lead (pounds)	Zinc (pounds)
Ore and concentrates amalgamated	23,310	10,265			
Sands and slimes cyanided	9,898	2,007			
Concentrates smelted	51,332	2,603,913	4,420,309	51,472,588	95,359,810
Ore smelted	4,935	275,900	385,691	2,233,412	46,190
Placer	13,143	2,801

northwest of Denver. Experimental work on gold recovery at another plant yielded some gold.

BOULDER COUNTY

Central (Jamestown) District.—Gold ore was shipped from the John Jay-Last Chance group in 1949. The Ozark-Mahoning Co. and the General Chemical Co. shipped lead-silver-gold-copper concentrate recovered as a byproduct in the beneficiation of fluorspar.

Gold Hill District.—The Cash mine, operated steadily by Henna Mines., Inc., produced 895 tons of ore yielding 1,600 ounces of gold, 19,421 ounces of silver, and 19,205 pounds of lead, with a total gross value of $68,449 and a net return to the mine of $52,697. A little ore was shipped from the Parker No. 2 and Twin Shaft claims. Placer gold was recovered from a clean-up of launders at a gravel-washing plant on the George Sawhill ranch.

Grand Island District.—The Caribou mine operated 12 months and the mill 7 months in 1949. This mine was the largest Boulder County producer of silver during the year; it is opened by a 3,600-foot adit and

a 540-foot shaft. Development in 1949 totaled 1,319 feet of drifts and 2,931 feet of diamond drilling.

Sugar Loaf District.—Producers in this district were the Franklin, Livingston, Cutout, and Nancy mines and a prospect.

CHAFFEE COUNTY

Chalk Creek District.—A test run of 370 tons of ore from the Mary Murphy dump was made by S. E. and W. E. Burleson in a jig mill installed on the property. The Stonewall mine shipped 231 tons of ore and the Ester No. 1 mine 8 tons.

Granite District.—A 2-ton lot of gold ore was shipped from the Hygra group in 1949. Some gold was produced at the Gold Basin (Good Hope) and Lost Canyon placers.

Monarch District.—The Garfield mine was operated from January to May 4 and from November 12 through December by S. E. and W. E. Burleson. The operators did 900 feet of drifting, crosscutting, and raising and shipped 100 tons of ore containing 49 ounces of gold, 353 ounces of silver, 34,660 pounds of lead, and 4,400 pounds of zinc.

From the New York mine, Earl Waite and A. W. Emerson shipped 42 tons of ore containing 1 ounce of gold, 2,177 ounces of silver, 566 pounds of copper, 3,961 pounds of lead, and 13,550 pounds of zinc. Other producers were the Lilly dump and the C. Ray Miller & Son Mining Co. property.

CLEAR CREEK COUNTY

Alice District.—In 1949 Lombard Mines, Inc., operated the Lombard mine and 100-ton flotation mill from January to June 14, when operations were interrupted by a bad surface cave. The mill product was gold-silver-lead-copper concentrate.

Argentine District.—The Grizzly Gulch mine, a substantial producer in 1948, was in production from January to June 1949. Operations the rest of the year were confined to development work. A little ore was shipped from a prospect.

Cascade District.—The Tyone Mining Co. drove 257 feet of crosscut in the Tyone mine and shipped some ore.

Empire District.—The P. M. Lessors worked the Gold Fissure group 90 days in 1949, producing silver-copper-lead ore. A truckload of ore was shipped from the Bonus mine.

Griffith District.—At the Terrible-Dunderberg group Gold Mines Consolidated, Inc., continued to mine ore until October 23 and worked on exploration the rest of 1949. The ore was milled in the Silver Spruce mill at Idaho Springs. The mill heads totaled 5,825 tons with an average assay at the mill of 0.03 ounce of gold and 7.27 ounces of silver a ton, 5.63 percent lead, and 7.01 percent zinc. The mill recovered 1,257 tons of bulk concentrate containing 0.16 ounce of gold and 24.40 ounces of silver a ton, 27.44 percent lead, and 27.07 percent zinc, with a gross value of $125,948; the net value after deducting transportation, treatment, and other charges, was $90,090. Most of the concentrate was sold to a custom selective-flotation mill at Leadville. The Smuggler group and Silver Leaf mill were operated intermittently by the Smuggler Mine (C. O. Parker, agent) and the Mile High Mining Co. Small lots of ore were shipped from the Collins and Stevens properties.

Idaho Springs District.—The principal producers in the Idaho Springs district in 1949 were the Franklin Mining Co. (Franklin mine), producing lead-gold-silver-zinc ore, and the Dixie mine of LeRoy Giles & Co., producing gold ore. The Franklin ore was treated in custom mills at Leadville and Idaho Springs, and the Dixie ore went to the company mill near Idaho Springs. Arthur Portenier operated the Ruth mill several months, treating ore from the Diamond Joe, Crazy Girl (Trail district), and Kitty Clyde mines. The Clear Creek-Gilpin and Black Eagle mills treated some custom ore. Other producing mines included the Brighton, Consolidated Park, Valentine, and Williams dump.

Montana District.—The Nabob Development Co. sank 50 feet of shaft and drove 250 feet of drifts on the Nabob property in 1949 and shipped 648 tons of ore containing 63 ounces of gold, 22,318 ounces of silver, 6,639 pounds of copper, and 84,376 pounds of lead. Bellevue Mines, Inc., drove 150 feet of raise, 55 feet of drifts, and 455 feet of tunnel in the Bellevue mine and shipped lead-silver-gold ore. Some ore was cleaned up and shipped from the Joe Reynolds property.

Mine production of gold, silver, copper, lead, and zinc in Colorado in 1949, by countie

Trail Creek District.—The Victoria Mining Co. shipped about 900 tons of ore from the Victor Lode group in 1949. About 100 tons of ore were shipped from the Ben Harrison dump and smaller quantities from the Gum Tree, Freeland-Toledo, and New Era mines.

CUSTER COUNTY

Hardscrabble District.—The producing mines in this district were the Defender and Lady Franklin, operated from January through May; the Passiflora, worked 60 days; the Thames River, active during January and February; and the Wild Girl, worked a few days.

DOLORES COUNTY

Pioneer (Rico) District.—The Rico Argentine Mining Co., one of the major producers of zinc, lead, and silver in Colorado from 1939 through 1948, suspended mining operations at its group of mines in May 1949 because of the declining metal prices. Development work was continued, the mill was completely remodeled, and a substantial tonnage of old tailings was remilled. Development included 4,073 feet of drifts, 726 feet of raises, 8 feet of winze, and 6,388 feet of diamond drilling. Ore from the Forest mine, Sambo property, South Park mine, and Wellington group was shipped to custom plants outside the county. Some gold and silver were recovered by hand methods from the St. Louis property.

EAGLE COUNTY

Holy Cross District.—Two truckloads of gold ore were shipped from the Glengary group in 1949.

Red Cliff (Battle Mountain) District.—The output of zinc from this district in 1949 again exceeded by a large margin that of any other Colorado district or county. Large-scale development and mining of the Battle Mountain deposits since 1915 have put the Red Cliff district in second place among Colorado districts in total recorded output of zinc and in first place in total copper production; the district is also among the State's leading silver producers. From 1941 to 1949 the output was mostly zinc ore; during the period 1932–40 a large quantity of iron-copper-silver ore was produced. The Eagle mine and 600-ton underground flotation mill of the New Jersey Zinc Co., Empire Zinc Division, operated continuously in 1949. The mine is developed through a tunnel, a vertical shaft (used to hoist and lower men and supplies), and a series of inclines. It is completely mechanized. Electric battery motors are used for underground haulage. The Tip Top and Gold Park mines produced a small quantity of direct-smelting ore.

EL PASO COUNTY

The Golden Cycle mill of the Golden Cycle Corp. at Colorado Springs operated in 1949 until February 20 on company and custom gold and gold-silver ores. Receipts comprised 23,042 tons of mine and dump ores from the Cripple Creek district and 311 tons from Boulder County. The mill was cleaned up and dismantled during the year.

FREMONT COUNTY

Two lots of gold ore were shipped from Canon City by the Gold Queen Mining Co. in 1949.

GARFIELD COUNTY

A sample lot (less than 1 ton) of ore was shipped from Carbondale in 1949.

GILPIN COUNTY

Southern (Blackhawk, Central City, Nevadaville, Russell Gulch) Districts.—Small lots of lead ore were trucked to the Leadville smelter from the Arris, Boodle, Druid, Dumas-Kinney, Independence, and Washington Day properties. Ore from surface diggings on "The Patch" property was treated in the mill built in 1948 by Chain O'Mines Operators, Inc., and operated by the Illini Corp. a short period in December 1949. Some ore was shipped from the Quartz hill property, and placer gold was recovered by hand methods on North Clear Creek.

Northern Districts.—The Gold Chief Mines, Inc., operated the We Got Em mine and 50-ton concentration mill from September 1 to November 15. The mill products were table concentrate and free gold caught on tables and mats. A dragline and nonfloating washing plant were operated on the Fools Luck placer from June to August.

GUNNISON COUNTY

Elk Mountain District.—The Park City Consolidated Mines Co. took over the Keystone property in June 1949. The company drove about 700 feet of development drifts, which yielded 850 tons of zinc-lead-silver ore, shipped to a custom mill at Leadville for treatment. The property was closed December 10 because of snow. A small lot of lead ore was shipped from the Louise claim.

Gold Brick District.—Bert Tucker shipped 5 tons of gold-silver-lead ore from Ohio City in 1949.

Taylor Park (Tin Cup) District.—John Lambertson worked the Star mine in 1949 and shipped 266 tons of ore containing 92,815 pounds of lead, 3,371 ounces of silver, 3 ounces of gold, and 129 pounds of copper.

Tomichi District.—The Akron-Erie mine and 100-ton flotation mill of the Callahan Zinc-Lead Co., Inc., at White Pine operated throughout 1949. Ore treated totaled 14,676 tons, from which were recovered 1,746 tons of lead-silver concentrate averaging 0.018 ounce of gold and 25.55 ounces of silver to the ton, 63.4 percent lead, 12.8 percent zinc, and 0.50 percent copper; and 3,181 tons of zinc concentrate averaging 0.011 ounce of gold and 5.01 ounces of silver to the ton, 52.0 percent zinc, 8.2 percent lead, and 0.34 percent copper. Mine development during the year totaled 1,667 feet of drifts, 329 feet of crosscut, 623 feet of raises, and 1,090 feet of diamond drilling.

HINSDALE COUNTY

Galena District.—Shipments of ore in 1949 comprised 152 tons from the Yellow Medicine mine, 102 tons from the California, 48 tons from the Capital City, and 22 tons from other mines and dumps.

Lake District.—Small tonnages of ore were shipped from the Black Crook-Ilma-Hiwassee, W. C. Garlock, and Cora-Sulphuret mines and the Lake City smelter dump.

JEFFERSON COUNTY

The gold output from Jefferson County in 1949 was recovered as a byproduct from gravel-washing plants.

LAKE COUNTY

Box Creek District.—The General Gold Corp. operated its Mount Elbert placers throughout the 1949 season, which lasted from April 1 to October 31. Equipment used included two dragline dredges and a bulldozer.

California (Leadville) District.—The output of silver, copper, lead, and zinc in the Leadville district in 1949 was larger than in 1948 despite some curtailments in development and mining operations caused by the drop in base-metal prices. Gold production, however, decreased.

The Resurrection Mining Co. operated its group of mines continuously and was again the principal producer of all five metals. The mine is opened by a 1,323-foot vertical shaft, six levels, and a 4-mile tunnel (old Yak) which intersects the shaft. Development work proceeded at the usual rate. The mill operated largely on company ore but also treated custom ore from Chaffee, Clear Creek, Custer, Lake, Park, Saguache, and Summit Counties.

The American Smelting & Refining Co. operated its 400-ton Leadville milling unit on a 6-day work week throughout 1949. The bulk of the ore treated came from the company Victory mine group at Kokomo, Summit County. The company Ibex-Garbut-Cora-Sunday group at Leadville was under development, with some production, throughout the year. The mill also treated custom ore from mines in Clear Creek, Gunnison, Hinsdale, Lake, Mineral, Ouray, Park, Rio Grande, Saguache, and Summit Counties.

The Fortune and New Monarch mines, operated by lessees, were consistent shippers to custom plants. Work at the New Monarch included considerable development on the Silent Friend vein on the 6th level of the Monarch shaft. Other shippers included the American smelter dump, A. Y. & Minnie, Ben Franklin mine, Chautauqua, Dolly B, Fanny Rawlings, Helen, Little Ellen, Moyer Placer, Rock & Dome, St. Louis, and Thomas Starr Placer. The Cloud City and Valentine mills treated some dump ore. The John Hamm Mining & Milling (Ltd.) mill was dismantled.

The Arkansas Valley smelter of the American Smelting & Refining Co. operated continuously. The smelter treats lead, lead-copper-gold-silver, and gold and silver ores and concentrates purchased from operators in nearly all the active mining districts of Colorado and concentrates, residues from zinc smelters, and other material from outside the State. Receipts in 1949 totaled 103,386 tons (97,150 tons in 1948).

In November the Bureau of Mines reactivated the Leadville drainage tunnel project, on which work began in 1943 and was discontinued September 1, 1945. The appropriation for the United States Department of the Interior for the fiscal year 1950 includes $250,000 cash and $250,000 contract authority for the project. The tunnel is designed to drain the mines in the Carbonate Hill, Evans Gulch, and Fryer Hill areas and part of the Downtown area; its contemplated length, including laterals, is 17,000 feet, of which 6,600 feet have already been

driven. The portal elevation is 9,957 feet. Test core drilling ahead of tunneling was being done by the Bureau staff in December 1949. Data on examination, mapping, and sampling in the district were published.[2]

Sugar Loaf District.—A sample of material from the Dinero dump was run in the Cloud City mill at Leadville and yielded 1 ton of silver-lead concentrate.

LA PLATA COUNTY

California (La Plata, Hesperus) District.—The Bessie G., Golden Rose, and Neglected mines shipped small tonnages of gold ore to smelters in 1949. Some silver ore was shipped from the Muldoon and Sarah G. properties.

MINERAL COUNTY

Creede District.—The Emperius Mining Co. operated its group of mines at Creede continuously in 1949. The group includes the Amethyst, Commodore, New York-Volunteer-Del Monte-Aspen, and Equinox properties. The output of lead and zinc was much larger than in 1948, and the group continued to be one of the leading producers of silver in the State. Improvements were made in the mill that increased its efficiency for selective flotation, and both lead-silver and zinc concentrate were produced. Some of the high-grade ore was shipped direct to the Leadville smelter. The Ridge (Mexico Mining Co.) mine, worked by lessees from January to November, shipped several cars of lead-zinc ore.

MONTEZUMA COUNTY

About a truckload of gold ore was shipped by the Wm. R. Westfall lease in the vicinity of the Red Arrow mine.

MONTROSE COUNTY

A little placer gold was recovered on San Miguel River.

OURAY COUNTY[3]

Red Mountain District.—The American Zinc, Lead & Smelting Co. operated the Mountain King group and the Kaemmerling property 8 months. The Lost Day mine was operated by the Morningside Development Co. nearly 8 months; output was 430 tons of ore containing 39,872 ounces of silver, 187,437 pounds of lead, and 11 ounces of gold. The company also shipped 30 tons of ore of a similar type from the Stanley Kremlin-J. I. C. group. Lessees operated the Ida L (Larson) mine intermittently. Other small producers included the Greyhound, Highland Lassie, and several prospects. The Idarado mill treated ore from claims in San Miguel County.

Sneffels District.—The Camp Bird mine, leading producer of all five metals in Ouray County, was operated by King Lease, Inc. During the year the company replaced 5,000 feet of 30-pound rail with 65-pound rail on the main haulage level and did 572 feet of raising, 761 feet of drifting, 335 feet of crosscutting, and 2,049 feet of diamond

[2] Ebbley, Norman E., Jr., and Schumacher, John I., Examination, Mapping, and Sampling of Mine Shafts and Underground Workings, Leadville, Lake County, Colo.: Bureau of Mines Rept. of Investigations 4518, 1949, 115 pp.

[3] Hazen, Scott W., Jr., Lead-Zinc-Silver in the Poughkeepsie District and part of the Upper Uncompahgre and Mineral Point Districts, Ouray and San Juan Counties, Colo.: Bureau of Mines Rept. of Investigations 4508, 1949, 110 pp.

drilling. The mine has more than 7 miles of underground workings. The combined lead and zinc concentrates made from 38,755 tons of ore treated in the company 125-ton flotation mill contained 2,083 ounces of gold, 137,397 ounces of silver, 364,247 pounds of copper, 2,127,659 pounds of lead, and 2,209,336 pounds of zinc. Lessees on a dump of the Camp Bird property shipped considerable ore. The Atlas, Jack Pot, and Minnie B mines produced some ore.

Uncompahgre District.—The American Zinc, Lead & Smelting Co. 300-ton custom mill at Ouray treated ore from about 38 mines in Ouray and San Juan Counties. The producing company mine in the Uncompahgre district was the Bachelor, operated from January through May. The Mickey Breen (Monarch) mine of Southwest Metals, Inc., was a good producer of lead-zinc-silver ore. Some ore was shipped from the Highland Chief mine, and a little gold was recovered by hand methods at the Wanakah millsite.

PARK COUNTY

Alma Placers-Fairplay District.—In 1949 the South Platte Dredging Co. operated its electrically powered bucket-line dredge (108 12-cubic-foot buckets) on South Platte River from March 22 through December; gravel washed totaled about 3,400,000 cubic yards, and output of gold was larger than in 1948. Small-scale placer miners produced some gold.

Buckskin District.—The Buckskin Joe Mines, Ltd., continued to operate the Phillips group and did exploratory development work. The ore produced was shipped to the Resurrection mill at Leadville. The American Flag, Criterion, and Sweet Home mines shipped some ore.

Consolidated Montgomery District.—W. E. Van Cooten shipped 156 tons of lead-silver ore in 1949.

Mosquito District.—The Orphan Boy mine shipped 454 tons of zinc-lead-gold-silver ore to custom plants at Leadville. A little gold ore was shipped from the Dauser mine. Development work was continued at the London Butte property.

PITKIN COUNTY

Roaring Fork (Aspen) District.—The Midnight Mining Co. operated its Midnight mine throughout 1949. The ore produced resulted from a program of prospecting in the near vicinity of the worked-out stopes of the main ore body. The mill feed totaled 6,194 tons, which yielded 194 tons of lead concentrate averaging 157.58 ounces of silver a ton and 42.19 percent lead; and 121 tons of zinc concentrate averaging 46.43 percent zinc and 25.26 ounces of silver a ton. Two small lots of ore and clean-up material containing lead and silver were shipped from other properties. The Aspen Mining Co. carried on exploratory drilling and crosscutting in the Smuggler-Durant group. The Bureau of Mines did exploratory drilling near Aspen during January and February.

RIO GRANDE COUNTY

Summitville District.—Jones & Nylene operated the Summitville mine 4 months in 1949. The ore produced was concentrated in the mill on the property. Mine development during the period included 280 feet of drifts.

SAGUACHE COUNTY

Cochetopa District.—The Cochetopa Mining Co., Inc., drove 56 feet of drifts on the Alaska Yukon Bell group and shipped 6 tons of zinc-lead-silver-copper ore containing arsenic.

Crystal Hill District.—The Crystal Hill Mining Co. built a mill at Center to be used for treating ore from the company Crystal Hill-Esperanza group of gold mines 18 miles west of Center, which are expected to operate in 1950.

Kerber Creek (Bonanza) District.—The largest producer in this district was the Antoro mine, operated continuously by S. E. and W. E. Burleson; ore shipped totaled 4,012 tons averaging 0.022 ounce of gold and 6.26 ounces of silver per ton, 1.03 percent copper, 8.24 percent lead, and 11.01 percent zinc. Other producing mines were the Blue Moon, Bonanza, Cocomongo, Brighton, Cora, Jupiter, Helen Mae, Liberty, Little Jenny, Herman W. Baca, and Rawley.

SAN JUAN COUNTY

Animas District.—The Shenandoah-Dives Mining Co., a large, steady producer since 1928, operated continuously its Shenandoah-Dives consolidated group of claims and the leased Silver Lake group. The two groups were operated as a unit. Mine development and exploration in 1949 included 3,248 feet of drifts, 158 feet of crosscuts, 642 feet of raises, and 1,673 feet of diamond drilling. The mine is connected with the company 700-ton mill by an aerial tram nearly 2 miles long. Company ore milled in 1949 totaled 186,072 tons and custom ore 15,259 tons. The yield of concentrates from the 201,331 tons of ore treated was 4,382 tons of flotation lead concentrate, 1,763 tons of flotation zinc concentrate, and 771 tons of iron-gold-silver-lead table concentrate containing in aggregate 9,093 ounces of gold, 459,719 ounces of silver, 510,301 pounds of copper, 4,470,457 pounds of lead, and 2,620,624 pounds of zinc.

Pride of the West, Inc., operated the Great Eastern mine 5 months and the Pride of the West-Green Mountain group 7 months, treating the ore in the company 100-ton flotation mill. The Osceola Mining & Milling Corp. operated the New Green Mountain (Osceola) and Lackawana mill from January to November. The Old Hundred-Gary Owen group was worked under lease by H. A. Reuther from January to April and by the Old Hundred Mining Co., owner, the rest of the year; shipments—all to custom mills—totaled 4,010 tons of lead-zinc-silver ore. The Highland Mary mine and mill operated from May 1 through December. Ore milled totaled 10,184 tons. The Blackstone-Lark and Silver Ledge mines shipped ore to custom plants. Other shippers included the Ben Franklin, Independence group, Mighty Monarch, Little Fannie, May Day, Little Nation, and Silver Cloud mines and several dumps.

Eureka District.—In 1949 the Columbus (Foursome) group shipped to custom mills more than 8,000 tons of zinc-lead-silver ore and treated some ore in addition in a small stamp mill at the mine. The Lead Carbonate mine and 40-ton flotation mill operated from January through August. Lessees at the Lucky Jacks mine shipped 817 tons of ore. Other small shippers included the Burrows, Caledonian, Cashier, Gold King, Great Eastern-Sioux City, Queen Anne, Silver Crown, and Treasure Mountain (Scotia).

Ice Lake Basin District.—Lessees at the South Mineral group drove 50 feet of drifts, did timbering and repair work, and shipped some ore.

SAN MIGUEL COUNTY

Iron Springs District.—The Silver Bell group and 150-ton mill were operated throughout 1949 by the Silver Bell Mines Co. Development during the year totaled 1,203 feet of drifts and 400 feet of raises. The mill product was bulk gold-silver-lead-copper concentrate. A new washing-sorting plant was being built as the year ended.

Lower San Miguel District.—A 1-ton test lot of silver-lead ore was shipped from the Little Eva claim. A little placer gold was recovered on San Miguel River.

Upper San Miguel District.—The output of zinc in this district increased 72 percent, lead 39 percent, copper 11 percent, and silver 10 percent from 1948. Gold production decreased 8 percent but was still higher than that of any other district in the State.

The Smuggler Union-Montana group of Telluride Mines, Inc., was the largest Colorado producer of gold in 1949 and an important producer of silver, lead, and zinc. Development during the year, including that driven in the new mill-level tunnel, totaled 5,747 feet of drifts, 690 feet of raises, 3,234 feet of tunnel, and 200 feet of diamond drilling. The mill has a daily capacity of 550 tons. The circuit was changed from bulk flotation to selective flotation. The crushed ore is ground in a Marcy ball mill and discharged over two Denver jigs to remove a gold concentrate, which is amalgamated. The jig tailings go to a Dorr classifier. The classifier overflow goes first to lead-copper flotation and then to zinc flotation.

The Idarado Mining Co. Black Bear-Ajax group, one of the leading producers of the five metals in the State, operated continuously. The mine is opened by the 12,000-foot Treasury tunnel, with its portal in Ouray County. The 1,100-foot raise on the Black Bear vein from the tunnel level was completed, and development of the Ajax and Argentine vein systems was continued. An underground primary crushing plant, capable of handling 200 tons an hour, was installed and put in operation at the raise. The company 500-ton mill, also in Ouray County, operated at capacity.

There were small outputs from the Andrus (East Ridge) group, Florence Lease, Thomas Hudson property, Tomboy group, and Kellog group.

SUMMIT COUNTY

Breckenridge District.—The Wellington mine, operated by W. L. Davenport, shipped to custom plants at Leadville 2,766 tons of ore containing 92 ounces of gold, 9,168 ounces of silver, 8,871 pounds of copper, 567,597 pounds of lead, and 917,326 pounds of zinc. Other small producers included the Briar Rose, Fredonia, Jumbo, Lancaster, Minnie, Monte Cristo, and Panther No. 2 lode properties and B & B placer.

Green Mountain District.—Frances L. McDaniel worked the Big Four mine and shipped zinc-lead-silver ore.

Montezuma District.—The Florado Mining Co. Pinnicle mine and 100-ton flotation mill operated intermittently. The Chatauqua mine was a substantial producer of silver and lead; most of the ore mined

was treated in the Teller Basin mill. Other small producers included the Bullion, Chatauqua Extension, Erickson, Mohawk, Quail, Radical, Rose, Silver King, Silver Wing, Waterloo, and Wauneita.

Ten Mile (Kokomo, Robinson) District.—The Kokomo unit (Victory group) of the American Smelting & Refining Co. was the largest producer of lead and the second-largest producer of zinc in the State in 1949 and ranked fourth in silver production. The ore also carries gold and copper. The production rate throughout the year was about the same as in 1948. The ore was trucked to the company Leadville milling unit for treatment. The Colonel Sellers mine shipped more than 3,000 tons of zinc-lead-silver-gold ore. The Wilfley mine shipped about 1,600 tons of zinc ore. Smaller shippers included the Kimberly, Michigan-Snowbank-Porter J, Nettie B, Lascanette, and K. S. & R. properties.

TELLER COUNTY

Cripple Creek District.—Mines in the Cripple Creek district continued to ship ore to the Golden Cycle mill at Colorado Springs until February 20, 1949, when the mill was closed. The rest of the year all the district mines were idle except those that worked on development and two that shipped small tonnages of ore to the Leadville smelter. The Golden Cycle Corp. worked on building its Carlton mill on the highway between Cripple Creek and Victor. The new mill is designed to replace the Golden Cycle mill as a market for Cripple Creek ore. The district output in 1949 (including gold recovered in the cleanup of the Golden Cycle mill) was 13,460 ounces of gold and 2,989 ounces of silver compared with 53,569 and 5,139 ounces, respectively, in 1948. Mines shipping more than 100 tons of ore in 1949 were the Cresson, Vindicator-Portland (United Gold Mines), Ajax (Golden Cycle Corp.), Elkton (dump), Tenderfoot-Sangre de Cristo-Mollie Kathleen, and Free Coinage. Operations of the first three mines, which produced 88 percent of the district total output of ore in 1949, are described in detail in annual reports to stockholders. The following data are abstracted from the reports.

Cresson Consolidated Gold Mining & Milling Co.—Despite the short period the Cresson mine operated in 1949, net gain for the year was $14,679, of which $11,784 was refund and interest on Federal income taxes levied in former years. This compares with a net gain of $16,548 for the full year 1948, a decrease of only $1,869, a good showing considering the heavy standby costs, taxes, and other necessary expenses to pay and no income during the last 10 months of the year. The shutdown period has been profitably utilized to do needed maintenance work and to complete installation of the Nordberg hoist, which will handle Cresson operations to a total depth of 5,000 feet.

Production of Cresson Consolidated Gold Mining & Milling Co., 1903–49

Period	Dry short tons	Gross value [1]	Freight and treatment	Net value	Dividends
1903–48	3,333,928	$47,956,031	$15,917,183	$32,038,848	$13,564,673
1949:					
Company ore	1,546	33,747	10,531	23,216	
Lessee ore	8,119	160,214	51,611	[2] 108,603	
1903–49	3,343,593	48,149,992	15,979,325	32,170,667	[3] 13,564,673

[1] Settlement value.
[2] Lessees received $51,888 as their share.
[3] Represents 28.17 percent of gross value and 42.16 percent of net value.

United Gold Mines Co.—Net loss for 1949 was $15,246 against a net loss in 1948 of $7,127. Since we operated so few days in 1949, production was very small. Company development on the Portland mine was concentrated in driving the Vindicator lateral on the Carlton tunnel level through Portland No. 2 shaft, in conjunction with the Cresson-Rose Nicol lateral drive, a joint operation with the Cresson Consolidated Gold Mining & Milling Co. On May 1, 1949, all underground lateral work was stopped, at which date the Cresson-Rose Nicol lateral had been driven a total of 1,829 feet and was approximately 2,000 feet from its ultimate objective, the projected position of the Cresson shaft. The Vindicator lateral had been driven 1,683 feet, leaving about 1,300 feet remaining to be driven to cut the first objective, the Ready Money vein of the Vindicator-Golden Cycle system.

Production of properties of United Gold Mines Co. in 1949, and before and after organization of the company (May 15, 1902) to Dec. 31, 1949

Mine	Net tons	Gross value [1]	Company ore cash receipts	Royalties received	Lessees' receipts
1949:					
Vindicator:					
Company ore	5,653	$23,631	$6,155		
Lessee ore	1,082	15,359		$3,416	$6,308
Portland: Lessee ore	297	14,012		5,957	5,677
Rose Nicol: Lessee ore					
Miscellaneous	54	448		24	201
Total 1949	7,086	53,450	6,155	9,397	12,186
Ore mined before consolidation	26,310	456,806	(2)	(2)	(2)

Golden Cycle Corp.—All mines in the Cripple Creek district owned by the Golden Cycle Corp. and mines of other major producers were shut down the middle of February to await erection of the new mill, located between Cripple Creek and Victor. The railroad ceased operating February 20, and the Golden Cycle mill stopped accepting ore shortly thereafter, so there was no mill to economically treat Cripple Creek ore the remainder of the year. Estimated on progress to date, barring unforeseen contingencies, the Carlton mill should be ready to accept custom ore in January 1951. It will have a nominal maximum capacity of 1,000 tons per day, but should the district production increase the capacity can very easily be increased to 1,500 tons a day.

During the brief operating period in 1949 the Golden Cycle mill treated a total of 23,353 net tons of ore, with a total gross value of $423,175, and an average per ton value of $18.12.

The Ajax mine ceased mining operations the middle of February 1949. During this short period it shipped 3,665 net tons of ore, with a total gross value of $117,981, and an average per ton value of $32.19. Company production was 2,952 net tons, with a total gross value of $111,760, and an average per ton value of $37.86; the average per ton ore value was raised considerably by the fact that in February 2 cars averaging $545 and $275 per ton were shipped. The shut-down period has been utilized to place the surface plant and the shaft in good operating condition, and the mine is ready to resume operations when the new mill is completed. Future ore production possibilities are excellent. Other wholly owned Golden Cycle Cripple Creek mining properties, including the Anchoria Leland, Index, and Cameron, did not operate during 1949.

East of the Mississippi River Gold, Silver, Copper, Lead, and Zinc

(MINE REPORT)

By Samuel A. Gustavson

GENERAL SUMMARY

MINE production of gold, copper, lead, and zinc reported by mines in the States east of the Mississippi River decreased 21, 22, 9, and 12 percent, respectively, in 1949 from that in 1948. The output of silver increased less than 1 percent. Lower prices for the base metals and work stoppages in the steel- and zinc-smelting and fabricating industries were the chief reasons for these decreases. Production of one or more of these five metals was reported from 119 lode mines and 2 placers in 12 of the States in the region. During 1949 the Eagle-Picher Mining & Smelting Co. and the Calumet & Hecla Consolidated Copper Co. each opened zinc-lead mines in the Northern Illinois-Wisconsin district, but the Vinegar Hill Zinc Co. in Wisconsin ceased production. Otherwise there was little change among the major producers. Demand for the base metals fell early in the year. Prices began to drop in March, and lows for 1949 were reached in late May and in June.

Production of the five metals (recoverable) in the region was 1,967 fine ounces of gold, 101,612 fine ounces of silver, 32,955 short tons of copper, 9,755 tons of lead, and 156,298 tons of zinc, with a total value of $56,788,593. The region's output was only a minor share of the United States production of gold and silver, but represented about 2 percent of the lead, 4 percent of the copper, and 26 percent of the zinc.

All tonnage figures are short tons and "dry weight"; that is, they do not include moisture.

The value of the metal production reported herein, except that of zinc in New Jersey, has been calculated at the prices in the following table. The value of the New Jersey output is the total value of the zinc recoverable as metal and oxide after freight, haulage, smelting, and manufacturing charges are added.

Prices of gold, silver, copper, lead, and zinc, 1945–49

Year	Gold [1] (per fine ounce)	Silver [2] (per fine ounce)	Copper [3] (per pound)	Lead [3] (per pound)	Zinc [3] (per pound)
1945	$35.00	$0.711+	$0.135	$0.086	$0.115
1946	35.00	.808	.162	.109	.122
1947	35.00	.905	.210	.144	.121
1948	35.00	.905+	.217	.179	.133
1949	35.00	.905+	.197	.158	.124

[1] Price under authority of Gold Reserve Act of Jan. 31, 1934. Treasury legal coinage value of gold from Jan. 18, 1837, to Jan. 31, 1934, was $20.67+ ($20.671835) per fine ounce.

[2] Treasury buying price for newly mined silver. 1945 to June 30, 1946: $0.71111111; July 1, 1946, to Dec. 31 1947: $0.905; 1948–49: $0.9050505.

[3] Yearly average weighted price of all grades of primary metal sold by producers. Price in 1945–47 includes bonus payments by Office of Metals Reserve for overquota production.

For copper the opening quotation, Connecticut Valley, was 23.5 cents per pound (highest since 1918). The low for 1949, reached June 17, was 16.0 cents and the year-end quotation was 18.5 cents. For lead the opening quotation, New York, was 21.5 cents per pound (highest on record). The low for 1949, first reached May 26, was 12.0 cents, which also was the year-end quotation. For zinc the opening quotation, E. St. Louis, was 17.5 cents (highest since 1916). The low, reached June 15, was 9.0 cents, and the year-end quotation was 9.75 cents.

Annual figures for the 5 years ended with 1949 and data showing the production of gold, silver, copper, lead, and zinc by months in terms of recoverable metal are given in accompanying tables. The figures for tonnage of ore sold or treated before 1949 do not include magnetite ore containing pyrite and chalcopyrite, from which copper, gold, and silver were recovered as byproducts. Minerals Yearbook, 1947 (p. 1379), contains a historical table showing mine production of gold, silver, copper, lead, and zinc in States east of the Mississippi River by years for 1906–47. The 1947 volume also contains a table (p. 1380) showing production of gold, silver, copper, lead, and zinc by months for 1943–47. Monthly production data for earlier years are not available.

Mine production of gold, silver, copper, lead, and zinc in States east of the Mississippi River, 1945–49, in terms of recoverable metals

Year	Mines producing		Material sold or treated		Gold (lode and placer)[1]		Silver (lode)[2]	
	Lode	Placer	Crude ore (short tons)	Old tailings (short tons)	Fine ounces	Value	Fine ounces	Value
1945	111		[3] 6,335,831	3,820,946	1,857	$64,995	106,044	$75,409
1946	108	5	[3] 5,451,340	3,763,871	1,432	50,120	79,266	64,047
1947	120		[3] 6,293,007	3,411,070	1,997	69,895	137,780	124,691
1948	110		[3] 6,544,541	2,349,877	2,479	86,765	101,171	91,565
1949	119	2	7,535,840	2,089,155	1,967	68,845	101,612	91,964

Year	Copper		Lead		Zinc		Total value
	Short tons	Value	Short tons	Value	Short tons	Value	
1945	42,856	$11,571,120	10,069	$1,731,868	180,322	$37,052,932	$50,496,324
1946	34,513	11,182,212	11,127	2,425,686	161,876	35,472,314	49,194,379
1947	36,875	15,487,500	9,026	2,599,488	181,792	42,810,934	61,092,508
1948	42,025	18,238,850	10,706	3,832,748	177,787	47,696,879	69,946,807
1949	32,955	12,984,270	9,755	3,082,580	156,298	40,560,934	56,788,593

[1] Includes placer gold as follows: 1945, none; 1946, 22 ounces; 1947–48, none; 1949, 27 ounces.
[2] No placer silver was produced during 1945–49.
[3] Excludes magnetite-pyrite-chalcopyrite ore from Pennsylvania.

Gold.—Gold was recovered from mines in Georgia, North Carolina, Pennsylvania, Tennessee, and Vermont during 1949. Total output in terms of recoverable metal was 1,967 fine ounces, a 21-percent decrease from 1948. In Georgia one lode and one placer mine produced 18 ounces of gold, and in North Carolina one lode and one placer mine produced 13 ounces of gold. All other gold reported produced in States east of the Mississippi was a byproduct of copper-bearing ores

and was recovered from slimes from electrolytic refining of the copper. These byproduct sources were, as in 1948, from magnetite-pyrite-chalcopyrite ore from the Cornwall mine, Lebanon County, Pa.; copper ore from the Elizabeth mine, Orange County, Vt.; and copper-iron-zinc ore from the Tennessee Copper Co. mines, Polk County, Tenn. The reported production of placer gold in 1949 was 27 fine ounces. No placer gold was reported in 1948. A portion of the placer gold was sold on the open market in its natural state for as much as $50 per ounce.

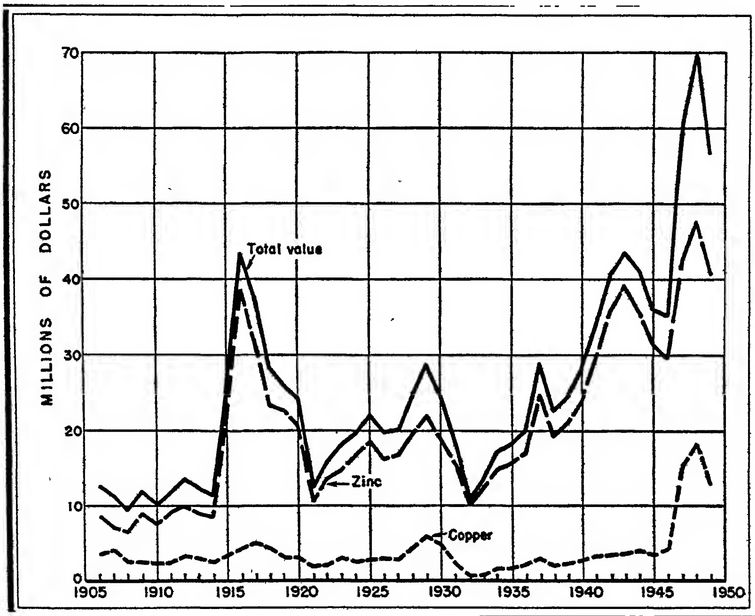

FIGURE 1.—Value of mine production of zinc and copper and total value of gold, silver, copper, lead, and zinc in States east of the Mississippi River, 1906–49.

Mine production of gold, silver, copper, lead, and zinc in States east of the Mississippi River, 1949, by months, in terms of recoverable metals

Total: 1949	1,967	101,612	32,955	9,755	156,298
1948	2,479	101,171	42,025	10,706	177,787

Mine production of gold in the Southern Appalachian States, 1799–1949

State	Period	Fine ounces	Value	State	Period	Fine ounces	Value
Alabama	1830–1949	49,495	$1,198,985	Tennessee	1831–1949	21,595	$503,455
Georgia	1830–1949	870,660	18,088,947	Virginia	1828–1949	167,558	3,577,509
Maryland	[1] –1949	6,102	163,940				
North Carolina	1799–1949	1,164,601	24,328,298	Total	1799–1949	2,598,812	55,423,259
South Carolina	1829–1949	318,801	7,562,125				

[1] Year of first production not recorded.

Silver.—There was little change from 1948 in the output of silver from mines in States east of the Mississippi River. Production was 101,612 fine ounces in 1949 and 101,171 fine ounces in 1948. All the silver was recovered as a byproduct from copper, lead, or zinc-lead ores from mines in Illinois, New York, Pennsylvania, Tennessee, and Vermont. The silver content of these ores is usually very low and often is not assayed.

Copper.—Copper production in States east of the Mississippi River in 1949 was 22 percent less than in 1948. The chief reasons for this decrease were: The closing of the Isle Royal Copper Co. mines in Michigan in December 1948; temporary cessation of underground mining and part of the reclamation work of the Calumet & Hecla Consolidated Copper Co. in Michigan because of the drop in the price of copper; and the loss of production from the Cornwall mine of the Bethlehem Steel Co. in Pennsylvania during the steel strike, October 1–31.

Producing companies in the States east of the Mississippi River, in order of output in 1949, were: The Calumet & Hecla Consolidated Copper Co. in Michigan; the Tennessee Copper Co. in Tennessee; Bethlehem Steel Co. in Pennsylvania; Vermont Copper Co. in Vermont; Quincy Mining Co. in Michigan; and Copper Range Co. in Michigan.

Lead.—Lead, chiefly a byproduct of fluorspar or zinc mining, was produced in Illinois, Kentucky, New York, Tennessee, Virginia, and Wisconsin during 1949. Total output in 1949, in terms of recoverable metal, was 9,755 short tons, a 9-percent decrease from 1948. Reduced output from the Austinville mine of the New Jersey Zinc Co. in Virginia, the largest producer of lead in the region, accounted for most of the decrease. Also the total output of mines in both Kentucky and Wisconsin recorded a slight decrease in the production of lead in 1949 compared with 1948. A small increase in total lead production was reported for Illinois, New York, and Tennessee. The principal producers, in order of rank within the region, were the New Jersey Zinc Co. in Virginia, Ozark-Mahoning Co. in Southern Illinois, St. Joseph Lead Co. in New York, and the Tri-State Zinc Co. in Northern Illinois.

Zinc.—Mines east of the Mississippi River supplied 26 percent of the total United States production of domestic zinc in 1949. Output from the region was 12 percent less than in 1948. The major portion of this decrease can be attributed to the loss of production from the New Jersey Zinc Co. mines in Sussex County, N. J., during the labor

strike at the Palmerton, Pa., zinc smelter (the mines were idle from September 27, 1949, to January 26, 1950). Mines in Virginia and Wisconsin also reported decreased production of zinc in 1949. However, a larger share of the zinc output credited to Wisconsin in 1948 was from ore mined and stockpiled during 1942–47 but not credited as production until the year milled. If only current production of zinc from mines in Wisconsin were considered for 1948 and for 1949, the 1949 output would be greater by 27 percent. Output from mines in Kentucky, Illinois, New York, and Tennessee increased in 1949.

MINING INDUSTRY

There were virtually no strikes at base-metal mines in the region east of the Mississippi River; however, the steel strike and the strike at Palmerton, Pa., zinc smelter materially affected the production of zinc and copper and to a lesser degree the lead, gold, and silver output. Virtually all the major mines producing in 1948 continued to operate in 1949. A notable exception was the copper mine of the Isle Royal Copper Co. in Michigan, which was closed in December 1948. The decline in prices for lead and zinc resulted in cessation of mining operations of the Vinegar Hill Zinc Co. and several smaller operators in Wisconsin. The decline in the price of copper caused the Calumet & Hecla Consolidated Copper Co. to cease operations for a short time at most of its copper properties in Michigan. The price decline also affected other large operators to the extent that they either curtailed production or did not proceed with so extensive plans for expansion or development. Production was reported from 119 lode mines and 2 placer mines in 1949 compared with 110 lode mines and no placer operations in 1948.

New operations in 1949 include the Eagle-Picher Mining & Smelting Co. zinc-lead mine in northern Illinois and the Calumet & Hecla Consolidated Copper Co. zinc-lead mine in Wisconsin. Production of zinc and lead also was reported from two mines in the prospecting or development stage near Embreeville, Washington County, Tenn., and one near Winchester, Frederick County, Va. Development of the New Jersey Zinc Co. zinc properties near Friedensville, Pa., was continued.

ORE CLASSIFICATION

Details of ore classification are given in the Gold and Silver chapter of this volume.

METALLURGIC INDUSTRY

During 1949 virtually all the ore and old tailings were treated at concentration mills at or near the mines, and the product was shipped to smelters, refineries, or oxide plants. Of the total of 9,624,995 short tons of material treated during the year, 7,535,840 tons were ore and 2,089,155 tons old tailings. The ore tonnage includes 1,536,728 tons of magnetite-pyrite-chalcopyrite ore produced in Pennsylvania, which had not been included in reporting for previous years. This tonnage is also reported in the chapter on iron ore in this volume. In 1948 a total of 8,894,418 tons of ore and tailings, exclusive of pyrite ore from

Ore sold or treated in States east of the Mississippi River in 1949, with content in terms of recoverable metals

Source	Ore and tailings (short tons)	Gold (fine ounces)	Silver (fine ounces)	Copper (short tons)	Lead (short tons)	Zinc (short tons)

[1] Data for copper in Pennsylvania (from magnetite-pyrite-chalcopyrite ore) and Vermont included with Tennessee; Bureau of Mines not at liberty to publish separate figures.
[2] Zinc from copper ore included with that from zinc ore; Bureau of Mines not at liberty to publish separate figures.
[3] Excludes magnetite-pyrite-chalcopyrite ore from Pennsylvania.

Pennsylvania, was produced. Of this total, 6,544,541 tons were crude ore and 2,349,877 tons tailings. In 1948 all the crude ore except 9,910 tons and all the tailings were treated in concentration mills at or near the mines. About 10 tons of gold ore in 1949 and about 36 tons in 1948 were treated by amalgamation.

The methods of treatment used in the mills and other operating details, including the tonnage and grade of concentrates produced at some mills, are given in the Review by States that follows.

Active smelters and refineries in States east of the Mississippi River that treated primary materials include copper plants at Hubbell and Hancock, Mich., Carteret, N. J., Laurel Hill, N. Y., Copperhill, Tenn., Baltimore, Md., and Barber, N. J.; lead plants at Barber, N. J., East Chicago, Ind., and Federal Hill, Ill.; zinc plants at Hillsboro, Fairmont City, La Salle, East St. Louis, and Depue, Ill., Donora, Palmerton, and Josephtown, Pa., Columbus, Ohio, and Meadowbrook, W. Va.

[3] Estimated smelting value of recoverable zinc content of ore after freight, haulage, smelting, and manufacturing charges are added.
[4] Data for copper in Pennsylvania and Vermont included with Tennessee; Bureau of Mines not at liberty to publish separate figures.

REVIEW BY STATES

GEORGIA

A total production of 18 fine ounces of gold was reported in 1949 for the State. One ounce from the Brand mine of the Cooperative Mining & Development Co. was sold during the year, although the mine was not operating. The remaining production was from the Josephine placer in Lumpkin County. Part of the output was sold to the United States Mint at Philadelphia and the remainder as natural gold specimens.

The Bureau of Mines published a report on the Chestatee copper and pyrite deposit.[1]

[1] Kline, M. H., and Beck, W. A., Investigation of Chestatee Copper and Pyrite Deposit, Lumpkin County, Ga.: Bureau of Mines Rept. of Investigations 4397, 1949, 12 pp.

943785—51——92

ILLINOIS

Northern Illinois.—During 1949 five mines operated in Jo Daviess County. Production totaled 345,474 tons of crude ore, from which 22,342 tons of zinc concentrates containing 12,433 tons of recoverable zinc and 1,617 tons of lead concentrates containing 1,184 tons of recoverable lead were obtained. Tri-State Zinc., Inc., operated its Bautsch, Heer, and Black Jack mines. The Bautsch mine operated throughout the year, whereas the Heer mine operated from January through July, and the Black Jack during January and February. The ore is concentrated in the company Gray mill by jigs and flotation. An inclined adit, 1,625 feet long, to the Bautsch mine was finished July 1. The ore is now hauled by Diesel trucks direct from the mine through the adit to the mill. Daily capacity of the Gray mill was increased from 600 to 850 tons by the addition of a new crushing plant which began operations on July 1. An inclined adit to the Black Jack mine was begun in October 1949. By the end of the year 290 feet of open-cut and 100 feet of adit had been completed. Churn drilling at the Bautsch mine totaled 3,554 and at the Black Jack mine 4,743 feet for the year.

The Eagle-Picher Mining & Smelting Co. operated the Graham and Snyder mines throughout the year. Both company and custom ore was treated in the new 70-ton-per-hour Graham central mill, which began shipments in April 1949.

During the year Vinegar Hill Zinc Co. completed milling the ore from Northern Illinois and Wisconsin mines that was stockpiled by the Office of Metals Reserve (Reconstruction Finance Corporation) during 1942–47. Although 1948 Minerals Yearbook stated that the remainder of this material was milled in 1948, milling was not completed until 1949. Of the residue of stockpiled ore finally milled in 1949, Illinois is credited with the production of 118 tons of zinc and 5 tons of lead (recoverable metal) obtained from 1,627 tons of zinc-lead ore.

The Bureau of Mines published reports on the Royal Princess zinc-lead deposit and the Gray zinc-iron deposits.[2]

Southern Illinois.—Production of zinc, lead, and silver was reported from 23 mines in the district during 1949 compared with 16 during 1948. However, output of all three metals decreased from that of 1948 owing chiefly to a drop in demand for fluorspar and the resulting decrease in production at the larger operations.

KENTUCKY

Total output of recoverable zinc and lead produced chiefly as a byproduct or coproduct with fluorspar was 935 and 187 short tons, respectively, during 1949. Zinc output increased 296 tons and lead output decreased 29 tons from that of 1948. The fluorspar-lead-zinc operations are situated principally in Crittenden and Livingston Counties. The principal producer was the Ozark-Mahoning Co.,

[2] Holt, Stephen P., Investigation of Royal Princess Zinc-Lead Deposit, Jo Daviess County, Ill.: Bureau of Mines Rept. of Investigations 4386, 1949, 13 pp.
Kenworthy, H., Metallurgical Investigations of the Recovery of Zinc and Iron Sulfides From the Gray Zinc-Iron Deposit, Galena, Ill.: Bureau of Mines Rept. of Investigations 4442, 1949, 12 pp.

which operated the Babb, Commodore, and Goering mines. Development at the three mines included 80 feet of shaft and 3,494 feet of diamond drilling. All the ore is treated at the company mill at Rosiclare, Ill. The Alco Lead Corp. operated the Mineral Ridge mine. The U. S. Coal & Coke Co., Fluorspar Division, operated the Tabb No. 1 and concentrated the ore at its fluorspar mill at Mexico, Ky. The company also shipped some ore from the Lafayette mine for treatment at the Ozark-Mahoning Co. mill at Rosiclare. Other fluorspar producers shipped small quantities of ore containing zinc, lead, and fluorspar to the Ozark-Mahoning mill. The Alcoa Mining Co. continued development of the Hutson zinc mine in Livingston County.

The Bureau of Mines published a report on the K. T. Dome mine.[3]

MICHIGAN

Mines in Michigan produced 30 percent less copper in 1949 than in 1948. Closing of the Isle Royal Copper Co. mines in December 1948 and suspension of work at underground operations by Calumet & Hecla Consolidated Copper Co. from May 1 through September 1 and at the Tamarack reclamation plant from April 18 through September 1 were the chief reasons for this decrease. Calumet & Hecla Consolidated Copper Co. also reported decreased production for the Lake Linden reclamation plant. The Copper Range Co. and the Quincy Mining Co., the only other producers in the State, reported slight increases in production in 1949.

Underground mines operated by the Calumet & Hecla Consolidated Copper Co. during 1949 were the Ahmeek, Douglass, Iroquois, Kearsarge, Peninsula, Allouez, Centennial, and Seneca No. 2. Ore from these mines is treated in the 6,000-ton-per-day Ahmeek mill. While in operation the mill was run three shifts, 7 days per week. The Lake Linden and Tamarack reclamation plants of the company also were run on a three-shift, 7-day-week basis. Extracts from the company annual report follow:

During 1949 the copper industry was subjected to violent fluctuations, both in price and in demand. When the demand for consumer goods fell off, copper fabricators and manufacturers found themselves with excessive inventories. For a time sales of copper virtually stopped, and in the second quarter of the year the price dropped from 23½ cents to 16 cents per pound. As inventories were worked off, however, the price gradually advanced, reaching 17⅝ cents in July. In November the price moved up to 18½ cents, and remained there until the end of the year. Prices of copper and brass tubing closely followed the market quotations for copper and zinc.

Our Company was gravely affected by the recession. The marginal nature of our copper mines made it impossible to produce copper for 16 cents per pound. Copper which had been produced or purchased at a cost of more than 16 cents had to be disposed of at a substantial loss. Profit that had been made in the first quarter was wiped out in the second quarter.

Effective May 1 and continuing throughout the year, the officers of the Company took a voluntary salary reduction of 10 percent. On May 1 the mines were shut down, many employees were laid off, and salaries were reduced. The mines were kept unwatered and necessary maintenance was carried on. The smelter continued operating at a curtailed rate, smelting concentrates and a small intake of secondary material.

[3] Beck, William A., Investigation of the K. T. Dome Zinc-Lead Mine, Owen and Henry Counties, Ky.: Bureau of Mines Rept. of Investigations 4575, 1949, 10 pp.

Resumption of mining operations at the Calumet Division on September 6 was made possible by a wage reduction of 15 cents per hour, reluctantly suggested by the Company and accepted by the employees. With the wage and salary reductions and other rigid operation economies in effect, production from the mines continued without substantial loss throughout the balance of the year. The results at the year end were encouraging, and we are hopeful that copper prices which will permit our mines to earn a profit will prevail in 1950.

Treatment of tailings was continued by the Quincy Mining Co. in its reclamation plant at Mason, Mich., throughout the year. The concentrates made were refined in the company smelter at Hancock, Mich.

Mining of the East Vein of the Champion mine was carried on throughout the year by the Copper Range Co. The ore was treated at the company mill at Freda, and the concentrates were shipped to the Calumet & Hecla Consolidated Mining Co. smelter for refining. Further exploration of the White Pine ore body was begun by the company in May. The company annual report makes the following statement concerning the White Pine ore body:

Six holes were completed for a total of 8,128 feet. The result has been to add at least 50 million tons of positive plus probable ore to our reserves. The total reserves as of the year end were 249,610,000 tons carrying 22.3 pounds of copper per ton, including 156,770,000 tons of parting shale ore averaging 24.3 pounds of copper per ton. The results of this exploration work further confirm the remarkable uniformity of the mineralization and the occurrence of ore under a large area. Drilling is continuing, and the results to date have added substantially to the reserves as given above.

NEW JERSEY

New Jersey mines produced 33 percent less zinc in 1949 than in 1948. The Franklin and Sterling Hill mines in Sussex County were shut down from September 27, 1949, to January 26, 1950, owing to a labor strike at the Palmerton, Pa., smelter. In reported value, zinc produced was worth 30 percent less in 1949 than in 1948.

The value of the New Jersey output of zinc given in the tables of this chapter is the combined value of the zinc recoverable in both metal and oxide after freight, haulage, smelting, and manufacturing charges have been added.

NEW YORK

In New York State three mines—two producing zinc and lead and one producing zinc only—continued to operate throughout 1949. Output of ore increased 9 percent over 1948 to 504,105 short tons. Production of zinc, in terms of recoverable metal, increased about 10 percent and lead 7 percent.

The total silver contained in lead concentrates shipped during 1949 was greater than in 1948. However, lead refiners reported 2 percent less recovered. Whether silver is or is not recovered from soft lead depends chiefly on the quantity of silver in the lead and the demand for desilverized lead.

All three mines are in St. Lawrence County. The St. Joseph Lead Co. operated the Balmat and the Edward mines. Zinc, lead, and iron concentrates are produced from the Balmat, which is operated through one 40° inclined shaft 2,907 feet long. The ore is treated in a company 1,200-ton flotation mill. Development at the mine during 1949

included 2,237 feet of drifts and 48,450 feet of diamond drilling, 9,387 feet underground drilling, and 39,063 feet from the surface. The Edwards mine, operated through two shafts—one 1,560 feet vertical from the surface and one underground 1,895 feet along a 42° slope—produces zinc ore which is concentrated in a company 600-ton-per-day capacity all-flotation mill. Development at the mine during the year included 337 feet of shaft, 1,167 feet of drifts, and 8,290 feet of diamond drilling.

The Hyatt mine was operated by the Universal Exploration Co. through a single shaft, 450 feet deep. Ore produced is milled in the company 200-ton-per-day flotation plant, and zinc and lead concentrates are made. Development at this mine during the year included 200 feet of drift.

A report on the Parker & Webb zinc deposits was published by the Bureau of Mines.[4]

NORTH CAROLINA

A test shipment of gold ore from a prospect on Jack Edwards property in Rutherford County was made by James I. Gantt. Dry weight of the shipment was 5 short tons. It assayed 0.56 ounce of gold per ton. About 10 ounces of placer gold were sold to the United States Mint at Philadelphia, Pa.

Reports on the Virgilina copper district in Virginia and North Carolina and on the Scarlet copper mine, Randolph County, N. C., were published by the Bureau of Mines.[5]

PENNSYLVANIA

The Bethlehem Steel Co. operated its Cornwall mine in Lebanon County continuously throughout the year. However, output of ore decreased 15 percent and production of gold, silver, and copper, in terms of recoverable metal, decreased 25, 21, and 26 percent, respectively, from that of 1948. Magnetite-pyrite-chalcopyrite ore is mined. Concentration is done in the company mill by magnetic separation and flotation. Copper concentrate made is shipped to Laurel Hill, N. Y. The mine is worked as both an open pit and underground operation. Capacity of the magnetic separation plant is 6,000 tons, flotation plant 2,200 tons, and sintering plant 2,400 tons per day. Operation of the mill is conducted on a three-shift, 5-day-week basis.

Development of the New Jersey Zinc Co. zinc mine in the Friedensville district was continued. The shaft was about 30 percent complete at the end of the year.

Zinc smelters at Donora, Josephtown, and Palmerton, Pa., treat most of the zinc concentrates produced in New York, Pennsylvania, and Tennessee, as well as large tonnages from other States and from foreign countries. The smelter at Palmerton was idle from September 26, 1949, to January 26, 1950, as the result of a dispute between labor and management.

Reports on the Albright Farm lead-zinc deposit and the Pickering Creek lead-zinc deposits were published by the Bureau of Mines.[6]

TENNESSEE

Production was reported from 12 mines operated by 5 companies in 1949 compared with 11 mines operated by 3 companies in 1948. All five metals were produced. Gold and silver were recovered as a byproduct of copper ores. Production of gold in terms of recoverable metal increased about 10 percent and silver about 5 percent; however, copper production decreased 3 percent from 1948. Zinc output was nearly the same as 1948. No lead production was reported in 1948, but 257 tons were recovered in 1949 from development and mining in Washington County near Embreeville.

The American Zinc Co. of Tennessee continued operation of the Grasselli, Jarnagin, and Mossy Creek mines in Jefferson County and the Mascot No. 2 mine in Knox County. All were operated throughout 1949 except the Mossy Creek mine, which was operated from January 1 to June 17. All ore is concentrated in the company mill at Mascot, Tenn. Initial concentration is made in a heavy-medium plant, followed by jigging and flotation. Jig and flotation concentrates are marketed after drying. Several sizes of limestone are also produced and sold. Development at the mines in 1949 included 2,123 feet of drifts, 12,760 feet of diamond drilling, and 1,605 feet of churn drilling at the Mascot No. 2; 2,453 feet of drifts, 2,411 feet of diamond drilling, and 6,612 feet of churn drilling at the Grasselli; 463 feet of drifts and 1,788 feet of churn drilling at the Jarnagin; and 280 feet of drift at the Mossy Creek.

In Polk County the Tennessee Copper Co. operated the Burra Burra, Calloway, Mary, Eureka, and Boyd mines throughout 1949. Development during the year included 1,140 feet of shaft, 10,845 feet of drifts, 3,304 feet of raises, and 16,866 feet of diamond drilling. Sublevel stoping and blast-hole drilling with diamond drills are employed in mining. Blasting is done with electric caps connected with instantaneous fuse. Ore is concentrated in two mills, the London with a capacity of 2,100 tons per day and the Isabella with a capacity of 1,200 tons per day. A bulk concentrate of iron, zinc, and copper is made first, then zinc, and copper concentrates, in that order, are recovered, the tailings being the iron concentrate. The zinc concentrate is shipped to the American Zinc Co. at East St. Louis, and the copper concentrate is smelted at the company smelter. The copper is cast as shot copper for manufacture of copper sulfate and other copper-bearing insecticides. The traces of gold and silver in the crude ore accumulate in slimes from the manufacture of copper sulfate. These slimes are recirculated through the smelter, and the gold and silver content builds up in the circuit. Occasionally blister copper from the smelter, relatively high in gold and silver, is cast into pigs weighing about 330 pounds each. These pigs are shipped to the Laurel Hill, N. Y., electrolytic plant, where the gold and silver are recovered.

Reed, Donald F., Investigation of Pickering Creek Lead-Zinc Deposits, Chester County, Pa.: Bureau of Mines Rept. of Investigations 4451, 1949, 11 pp.

Products of the Tennessee Copper Co. at Copperhill include sulfuric acid, liquid SO_2 (less than 100 p. p. m. water), granulated slag, iron sinter, copper sulfate, insecticides, blister copper, and zinc concentrates.

The Universal Exploration Co. operated the Davis-Bible group of claims and 800-ton- (875 to 900 tons maximum per 24 hours) per-day mill throughout 1949 except for the period October 7 to November 21. The exceptionally high grade zinc concentrates are shipped to the Donora, Pa., smelter. Tailings from the mill are sold as agricultural lime. Development in the mine during 1949 included 236 feet of shaft, 1,321 feet of drifts, 8,779 feet of diamond drilling, and 2,533 feet of churn drilling.

In Washington County the Appalachian Zinc Co. produced a small quantity of zinc-lead ore, and the Cove Development Co. produced a small quantity of lead ore during the latter half of the year.

The Bureau of Mines published reports on the Tennessee Zinc Co. property, Bumpus Cove, Unicoi County; the Eve Mills zinc deposit, Monroe County; and the Idol and Dalton zinc deposits, Grainger County.[7]

VERMONT

Gold, silver, and copper were produced by the Vermont Copper Co. from the Elizabeth mine and dumps and the Ely dumps in Orange County. Operation was steady throughout 1949, and production of copper increased 35 percent, gold 15 percent, and silver 10 percent over 1948. The ore, containing chalcopyrite and pyrrhotite with a small quantity of gold and silver, was concentrated in the company 500-ton flotation mill. Several improvements were made to the mill in 1949. Concentrates are shipped to the Phelps-Dodge Corp. smelter and refinery at Laurel Hill, N. Y.

The Bureau of Mines published a report on the Ely mine copper deposit in Orange County.[8]

VIRGINIA

Output of lead and zinc decreased 30 and 17 percent, respectively, in Virginia in 1949 from that of 1948. However, the major producer operated continuously throughout the year. No copper, gold, or silver production was recorded in 1949.

The Austinville zinc-lead mine and 2,000-ton-per-day mill operated throughout 1949. Mining was on a two-shift, 6-day-week basis. Trammers and repairmen only worked on the third shift. The mill operated three shifts, 5 days a week.

During the latter part of the year the Timberville Mining Co. produced a small quantity of ore from its property in Frederick County. The ore was concentrated by the American Zinc Co. of Tennessee at the Mascot, Tenn., mill.

The Bureau of Mines published reports on the Valzinco lead-zinc mine and the Allah-Copper lead-zinc mine.[9]

WISCONSIN

During 1949 Wisconsin mines produced and treated 153,055 tons of ore and old tailings containing in terms of recoverable metal 813 tons of lead and 4,108 tons of zinc. In 1948 Wisconsin mines produced and treated 97,595 tons of ore and old tailings containing, in terms of recoverable metal, 577 short tons of lead and 3,224 tons of zinc. These data show that the output of lead and zinc in Wisconsin in 1949 increased 41 and 27 percent, respectively, over 1948.

In addition, 20,907 tons of ore mined in Wisconsin before 1948 were treated in 1949. Most of this ore was from the stockpile of the Office of Metals Reserve. The remainder was ore stocked by the Vinegar Hill Zinc Co. This ore contained, in terms of recoverable metal, 44 tons of lead and 1,187 tons of zinc. The 1948 Minerals Yearbook incorrectly reported that all of the material in the OMR stockpile had been treated by the close of 1948. All the ore owned by OMR for account of the Vinegar Hill Zinc Co. was purchased by the Vinegar Hill Zinc Co. in 1948, but that company did not complete milling until 1949. For data on that portion of OMR stocks originating from mines in Illinois, see the Illinois section of this chapter.

Over 50 percent of the ore produced in Wisconsin was treated or received final concentration at the Vinegar Hill Zinc Co. custom mill near Platteville. Some operators make a rough concentrate on tables or jigs, producing a high-grade lead concentrate and an intermediate concentrate of lead and zinc, or, if the ore contains very little lead, produce only an intermediate-grade zinc concentrate. Lead concentrates are usually sold to local ore buyers, and the zinc or zinc-lead product is shipped to Vinegar Hill Zinc Co. for further concentration.

The Vinegar Hill Zinc Co. operated from January 1 to August 4, when milling operations ceased chiefly because of the low price for zinc. Many of the small operators ceased mining when this mill was closed. Some then shipped ore to the Eagle-Picher Mining & Smelting Co. Graham mill near Galena, Ill.

Opening of a mine near Shullsburg in Lafayette County, Wis., by the Calumet & Hecla Consolidated Copper Co. in the latter part of 1949 promised to be a major factor in the lead and zinc industry in the State. Development of the mine and construction of a 1,200-ton mill were carried on throughout the year. Concentrates were first shipped to a smelter in September. Ore treated during the year was chiefly from development.

Wisconsin's largest zinc and lead producer during 1949 was the Andrews mine, operated by the Cuba Mining Co. Ore from this property was treated in a 25-ton-per-hour gravity mill, producing a high-grade lead concentrate and an intermediate-grade zinc-lead concentrate. This latter concentrate was treated further at the Vinegar Hill Zinc Co. custom mill. According to the management, the mine

Grosh, Wesley A., Investigation of the Allah-Copper Lead-Zinc Mine, Louisa County, Va.: Bureau of Mines Rept. of Investigations 4604, 1949, 6 pp.

was closed July 9 because of the low price of zinc. The Dodgeville Mining Co. operated the Dodgeville No. 1 and No. 2 mines from January 1 to October 19. This company also ceased operation because of the low price of zinc. It was the second largest producer of lead and zinc in the State. The ore was treated in the company mill by gravity and flotation methods. The company completed 17,500 feet of prospect churn drilling in 1949.

Other producers, in order of output, include: Meekers Grove Mining Co., George M. Baker Mining Co., Whitechurch & Farr, Kittoe Mining Co., L. G. & W. Mining Co., Murray & Richards, and the Benton Milling Co. Other individuals or companies made small shipments of ore.

Reports of investigations of several Wisconsin zinc and lead deposits were published by the Bureau of Mines in 1949.[10]

OTHER STATES

No production of gold, silver, copper, lead, or zinc was reported in other States in the region during 1949. The Bureau of Mines published a report on the copper-bearing pyrite ores in Clay County, Ala.[11]

Idaho

Gold, Silver, Copper, Lead, and Zinc

(MINE REPORT)

By C. E. Needham and Paul Luff

GENERAL SUMMARY

GOLD was the only major nonferrous metal to attain an increased output in Idaho in 1949. Lead, zinc, and silver—the principal metals mined in Idaho—each declined and copper as well. The gold output increased from 58,454 fine ounces in 1948 to 77,829 in 1949 (a 33-percent gain); but the silver output declined from 11,448,875 fine ounces to 10,049,257 (a 12-percent loss); copper from 1,624 short tons to 1,438 (an 11-percent loss); lead from 88,544 tons to 79,299 (a 10-percent loss); and zinc from 86,267 tons to 76,555 (an 11-percent loss). The lead output again exceeded the zinc output, but only by 4 percent. The total value of the five metals dropped from $67,758,290 in 1948 to $56,429,796 in 1949 (a 17-percent loss). The total value of the gold was $2,724,015—5 percent of the State total value; silver, $9,095,085—16 percent; copper, $566,572—1 percent; lead, $25,058,484—44 percent; and zinc, $18,985,640—34 percent. In 1949 the State remained the largest producer of silver and zinc in the United States and the second-largest producer of lead (exceeded only by Missouri). About 91 percent of the State silver production, 81 percent of the copper, 94 percent of the lead, and 97 percent of the zinc came from the Coeur d'Alene region of Shoshone County; the remaining silver, copper, lead, and zinc came largely from the Warm Springs district in Blaine County.

About 69 percent of the State gold production in 1949 came from a lode mine in the Yellow Pine district, Valley County; the remainder came largely from dredging operations in the Elk City district, Idaho County; Boise Basin district, Boise County; and Yankee Fork district, Custer County.

All tonnage figures are short tons and "dry weight"; that is, they do not include moisture.

The value of the metal production reported herein has been calculated at the following prices.

Prices of gold, silver, copper, lead, and zinc, 1945–49

Year	Gold [1] (per fine ounce)	Silver [2] (per fine ounce)	Copper [3] (per pound)	Lead [3] (per pound)	Zinc [3] (per pound)
1945	$35.00	$0.711+	$0.135	$0.086	$0.115
1946	35.00	.808	.162	.109	.122
1947	35.00	.905	.210	.144	.121
1948	35.00	.905+	.217	.179	.133
1949	35.00	.905+	.197	.158	.124

[1] Price under authority of Gold Reserve Act of Jan. 31, 1934. Treasury legal coinage value of gold from Jan. 18, 1837, to Jan. 31, 1934, was $20.67+($20.671835) per fine ounce.
[2] Treasury buying price for newly mined silver. 1945 to June 30, 1946: $0.71111111; July 1, 1946, to Dec. 31, 1947: $0.905; 1948–49: $0.9050505.
[3] Yearly average weighted price of all grades of primary metal sold by producers. Price in 1945–47 includes bonus payments by Office of Metals Reserve for overquota production.

Mine production of gold, silver, copper, lead, and zinc in Idaho, 1945–49, and total, 1863–1949, in terms of recoverable metals

Year	Mines producing		Ore (short tons)	Gold (lode and placer)		Silver (lode and placer)	
	Lode	Placer		Fine ounces	Value	Fine ounces	Value
1945	116	27	3,139,286	17,780	$622,300	8,142,667	$5,790,341
1946	139	71	2,882,187	42,975	1,504,125	6,491,104	5,244,812
1947	183	99	3,717,697	64,982	2,274,370	10,345,779	9,362,930
1948	194	78	3,981,846	58,454	2,045,890	11,448,875	10,361,810
1949	171	82	3,057,075	77,829	2,724,015	10,049,257	9,095,085
1863–1949			(1)	8,042,014	184,609,893	552,329,323	387,851,818

Year	Copper		Lead		Zinc		Total value
	Short tons	Value	Short tons	Value	Short tons	Value	
1945	1,548	$417,960	68,447	$11,772,884	83,463	$19,196,490	$37,799,975

[1] Figure not available.

Gold.—The output of recoverable gold in Idaho in 1949 was 77,829 ounces, 19,375 ounces more than in 1948. The gain was entirely from lode mines, as the output of gold from placer properties decreased 5,698 ounces. Gold from lode mines in 1949 was 62,751 fine ounces compared with 37,678 fine ounces in 1948, and that from placer properties was 15,078 fine ounces compared with 20,776 fine ounces. The Yellow Pine lode mine in Valley County, worked by the Bradley Mining Co., continued to be by far the largest gold producer in Idaho, and its output in 1949 was nearly double that in 1948; it was followed by a bucket-line dredge at Elk City worked by the Warren Dredging Corp; a bucket-line dredge at Idaho City worked by the Idaho-Canadian Dredging Co.; a lode property at Atlanta worked by Talache Mines, Inc.; and a dragline dredge on Jordan Creek worked by Jordan Placers, Inc. Of the total gold produced in Idaho in 1949, nearly 74 percent came from gold ore, 13 percent from bucket-line dredging, 6

percent from dragline dredging, and most of the remainder from zinc-lead ore. Four bucket-line dredges and 7 dragline dredges treated about 3,000,000 cubic yards of gravel in 1949 and recovered 14,707 fine ounces of gold and 4,334 fine ounces of silver.

Gold produced at placer mines in Idaho, 1945–49, by classes of mines and by methods of recovery

Class and method	Mines producing	Material treated (cubic yards)	Gold recovered		
			Fine ounces	Value	Average value per cubic yard

1949	[2] 82	3,046,837	15,078	527,730	.173

[1] Includes all placer operations using power excavator and washing plant, both on dry land; an outfit with movable washing plant is termed a "dry-land dredge."

[2] A mine using more than one method of recovery is counted but once in arriving at total for all methods.

Silver.—Idaho's output of recoverable silver in 1949 was 10,049,257 ounces, 1,399,618 ounces less than that in 1948. The loss resulted mainly from curtailment of operations during the latter half of the year at zinc-lead-silver mines caused by declines in the prices of lead

and zinc and from a strike at the Bunker Hill lead smelter at Bradley from August 20 to November 14. However, the State remained the largest producer of silver in the United States—a place it has held since 1933. The Coeur d'Alene region produced 9,146,146 fine ounces of silver in 1949 or 91 percent of the State total silver; the remainder came largely from the Warm Springs, Yellow Pine, and Bayhorse districts. Of the State total silver, silver ore yielded 42 percent, zinc-lead ore and old tailings 42 percent, lead ore 15 percent, and gold ore most of the remainder. The recovery of silver from silver ore decreased 1,485,378 ounces, that from zinc-lead ore 299,622 ounces, and that from gold ore 141,685 ounces, but that from lead ore increased 535,517 ounces.

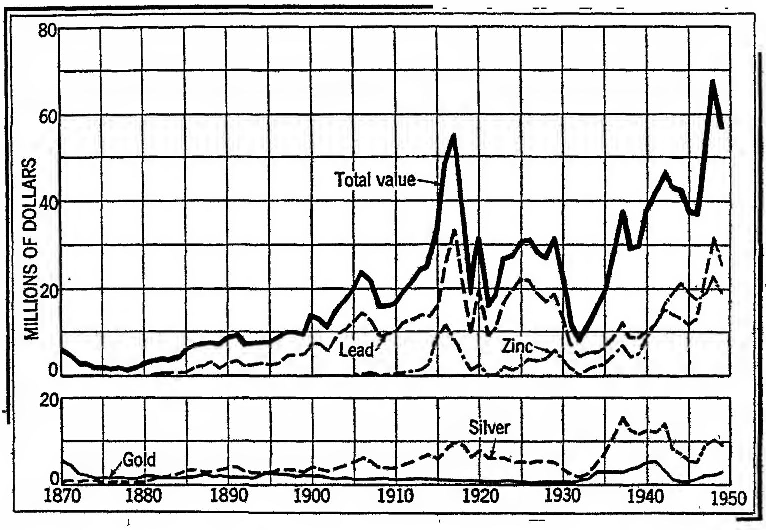

FIGURE 1.—Value of mine production of gold, silver, lead, and zinc, and total value of gold, silver, copper, lead, and zinc in Idaho, 1870–1949. The value of copper has been less than $2,000,000 annually, except in a few years.

Mine production of gold, silver, copper, lead, and zinc in Idaho in 1949, by months, in terms of recoverable metals

Month	Gold (fine ounces)	Silver (fine ounces)	Copper (short tons)	Lead (short tons)	Zinc (short tons)
January	2,337	840,600	100	8,165	7,455
February	2,632	987,300	110	7,040	6,285
March	3,934	1,047,200	145	8,470	7,430
April	6,312	1,128,600	150	8,115	7,245
May	7,160	1,237,000	185	8,030	7,110
June	8,452	991,000	140	7,455	7,200
July	8,542	886,000	130	6,640	6,495
August	7,230	995,500	135	6,915	6,535
September	8,987	321,000	60	3,305	4,315
October	8,687	194,500	40	2,775	3,745
November	7,622	484,053	81	5,029	5,863
December	6,934	994,504	162	7,360	6,877
Total: 1949	77,829	10,049,257	1,438	79,299	76,555
1948	58,454	11,448,875	1,624	88,544	86,267

Twelve mines—the Sunshine, Bunker Hill & Sullivan, Polaris, Page, Silver Dollar, Triumph, Sherman, Silver Syndicate, Silver Summit, Lucky Friday, Star, and Morning—produced 83 percent of the silver output of the State in 1949. Six properties (Sunshine, Polaris, Silver Syndicate, Silver Dollar, Sunshine Consolidated, and Metropolitan) near Kellogg, operated by the Sunshine Mining Co., produced 4,742,708 ounces of silver in 1949, or 47 percent of the State total.

Copper.—The output of copper in Idaho declined to 1,438 short tons in 1949, 186 tons less than that in 1948. About 72 percent of the State copper output in 1949 was recovered as a byproduct in the treatment of zinc-lead ore and silver ore from mines in the Coeur d'Alene region; the remainder was recovered largely from zinc-lead ore produced in the Warm Springs district.

The Sunshine mine near Kellogg in the Coeur d'Alene region continued to be the largest producer of copper in Idaho. It was followed by the Triumph, Bunker Hill & Sullivan, Polaris, and Silver Dollar properties.

Lead.—In 1949 the mines in Idaho produced 79,299 short tons of recoverable lead, 9,245 tons less than in 1948. The loss resulted principally from curtailment of operations during the latter half of the year at zinc-lead-silver mines, caused by a drop in the prices of lead and zinc and by a strike at the Bunker Hill lead smelter at Bradley from August 20 to November 14. However, the lead output again exceeded the zinc output, but in the Coeur d'Alene region, where most of Idaho's lead and zinc is produced, it was the reverse—the zinc output exceeded the lead output. In 1949, 94 percent of the State total lead came from the Coeur d'Alene region; most of the remainder was produced in the Warm Springs, Bayhorse, Alder Creek, Clark Fork, and Texas districts. Zinc-lead ore and old tailings (1,851,268 tons) from the Coeur d'Alene region yielded 77 percent of the State total lead; and lead ore and silver ore, chiefly from the Coeur d'Alene region, yielded 18 percent. The remainder came largely from zinc-lead ore in the Warm Springs and Bayhorse districts, lead ore in the Bayhorse, Alder Creek, Clark Fork, Texas, and Port Hill districts,

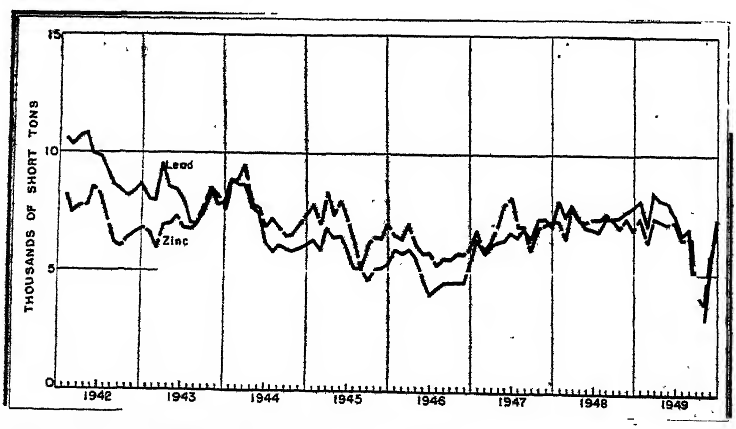

FIGURE 2.—Mine production of lead and zinc in Idaho, 1942–49, by months, in terms of recoverable metals.

and old zinc slag in the Coeur d'Alene region. Lead recovered from zinc-lead ore and old tailings decreased 14,319,114 pounds, that from silver ore 2,582,329 pounds, that from zinc ore and old slag 978,756 pounds, and that from lead ore 618,297 pounds.

The Bunker Hill & Sullivan mine at Kellogg was by far the largest producer of lead in Idaho in 1949, although its output decreased nearly 11 percent from 1948. In 1949 the combined lead output of the six largest producing mines (each producing more than 6,000,000 pounds)—the Bunker Hill & Sullivan, Page, Star, Morning, Sherman, and Sidney—was 101,317,987 pounds or 64 percent of the State total. Other important producers in 1949 were the Triumph, Bunker Hill & Sullivan mill tailing dump, Dayrock, Frisco, Tamarack, and Sunshine properties.

Zinc.—Idaho's output of recovered zinc declined to 76,555 short tons in 1949, 9,712 tons less than that in 1948. This loss resulted from the same causes that reduced the silver and lead outputs. About 97 percent of the State total zinc in 1949 came from the Coeur d'Alene region and most of the remainder from the Warm Springs district. Zinc-lead ore and old tailings concentrated yielded 93 percent of the State total zinc; old zinc slag smelted and fumed, 3 percent; and zinc ore concentrated and lead ore concentrated, 3 percent.

Ten properties (each producing more than 5,000,000 pounds of zinc)—the Star, Page, Morning, Sidney, Bunker Hill & Sullivan, Frisco, Amazon-Carlisle, Spokane-Idaho, Highland-Surprise, and Tamarack—produced 80 percent of the State total zinc in 1949.

MINE PRODUCTION BY COUNTIES

Mine production of gold, silver, copper, lead, and zinc in Idaho in 1949, by counties, in terms of recoverable metals

MINING INDUSTRY

Despite an adequate supply of mine labor, Idaho's mining industry suffered a serious setback in 1949, owing to a strike from August 20 to November 14 at the Bunker Hill lead smelter at Bradley, which caused most of the large producing zinc-lead-silver and silver-lead mines in the Coeur d'Alene region to suspend operations. This strike, coupled with continuous declines in the prices of lead and zinc during the second quarter of the year, caused substantial decreases in production of silver, copper, lead, and zinc in 1949 compared with 1948. However, gold production rose from 58,454 fine ounces to 77,829, because the Bradley Mining Co. treated an ore richer in gold from its Yellow Pine mine at Stibnite. The output of zinc-lead ore and old tailings (by far the chief ore output of the State) decreased from 2,824,758 tons to 1,920,206, gold ore from 672,681 tons to 624,083, and zinc ore and old slag from 79,674 tons to 49,401; silver ore increased from 149,691 tons to 175,225, and lead ore from 253,648 tons to 287,664. About 98 percent of the gold ore mined in Idaho in 1949 came from the Yellow Pine mine at Stibnite, Valley County, where the output decreased from 655,682 tons in 1948 to 610,988 tons in 1949, but production of gold in 1949 was nearly double that in 1948. About 78 percent of the silver ore, 99 percent of the zinc ore and old slag, 96 percent of the zinc-lead ore and old tailings, and nearly 86 percent of the lead ore was produced in the Coeur d'Alene region. Placer mining indicated greater activity, but production of gold from this source declined owing to exhaustion of commercial gravel in the Boise Basin district, Boise County, where one bucket-line dredge, operated

for the past 15 years, ceased work in March. Thirteen dredges (7 dragline, 4 bucket-line, and 2 suction) recovered 14,761 fine ounces of gold in Idaho in 1949, compared with 15 dredges (7 dragline, 5 bucket-line, and 3 suction) in 1948 that recovered 20,264 fine ounces of gold.

ORE CLASSIFICATION

Details on ore classification are given in the Gold and Silver chapter of this volume.

Ore sold or treated in Idaho in 1949, with content in terms of recoverable metals

Source	Mines producing	Ore (short tons)	Gold (fine ounces)	Silver (fine ounces)	Copper (pounds)	Lead (pounds)	Zinc (pounds)
Dry gold ore	33	624,083	57,281	108,613	229	4,050	130
Dry gold-silver ore	4	79	54	1,468	212	1,037	------------
Dry silver ore	21	175,225	320	4,250,576	1,150,956	4,844,976	351,710
Total	58	799,387	57,655	4,360,657	1,151,397	4,850,063	351,840
Copper ore	7	384	10	554	82,510	------------	------------
Lead ore	62	287,664	772	1,475,017	289,911	23,865,407	2,336,052
Lead-copper ore	3	33	2	2,702	2,518	9,713	------------
Zinc ore	4	[1] 49,401	16	14,950	9,480	1,182,480	7,490,088
Zinc-lead ore	59	1,920,206	4,296	4,190,996	1,340,184	128,690,337	142,932,020
Total lode mines	[2] 171	[1] 3,057,075	62,751	10,044,876	2,876,000	158,598,000	153,110,000
Placers	82	------------	15,078	4,381	------------	------------	------------
Total: 1949	253	[1] 3,057,075	77,829	10,049,257	2,876,000	158,598,000	153,110,000
1948	273	[3] 3,981,846	58,454	11,448,875	3,248,000	177,088,000	172,534,000

[1] Includes 22,389 tons of old lead-smelter slag.
[2] A mine producing more than 1 class of ore is counted but once in arriving at total for all classes.
[3] Includes 48,131 tons of old lead-smelter slag.

METALLURGIC INDUSTRY

Of the 3,057,075 tons of ore produced in 1949 in Idaho, 3,011,615 tons (98.5 percent) were treated at milling plants, and the remainder—45,460 tons (1.5 percent)—was shipped crude to smelters.

Milling plants in 1949 treated principally zinc-lead ore and old tailings (1,919,466 tons), gold ore (624,029 tons), lead ore (277,089 tons), silver ore (164,386 tons), and zinc ore (26,575 tons). Current hot zinc slag totaling 81,781 tons was fumed, and 22,389 tons of old dump lead-smelter slag were delivered for smelting and fuming in 1949. Metals recovered from the old dump slag were credited to the Bunker Hill smelter dump, and metals recovered from the hot slag were credited to various producers of the ores and concentrates that contributed during the year to the slag-making material.

The Bunker Hill & Sullivan Mining & Concentrating Co. operated its Bradley lead smelter and refinery on ore and concentrates, chiefly from mines and mills in the Coeur d'Alene region; both plants were closed from August 20 to November 14 owing to a strike. The company also operated its antimony and cadmium plants, 2,000-ton flota-

943785—51——93

tion mill (including a sink-and-float unit), 300-ton tailing-treatment plant for recovery of silver, iron, lead, and zinc from old jig tailings, and 450-ton zinc slag-fuming plant at Bradley. According to the company annual stockholders' report for 1949, the smelter produced 7,224 ounces of gold, 7,528,102 ounces of silver, 22,039 pounds of cadmium, 753 tons of copper, 456 tons of antimony, 8,836 tons of zinc, and 44,571 tons of lead. The slag-fuming plant yielded 12,589 dry tons of deleaded zinc fume and 3,068 dry tons of zinc-lead fume; the production of lead and zinc in 1949 was less than that in 1948 as the plant was closed from August 20 to December 31. The Sullivan Mining Co. operated continuously throughout the year its 150-ton electrolytic zinc plant near Bradley, producing 41,854 tons of high-grade slab zinc and 203 tons of cadmium. In addition, the plant recovered from residues and other byproducts 6,071 tons of zinc, 3,385 tons of lead, 111 tons of copper, 325,917 ounces of silver, and 1,374 ounces of gold. The Bradley Mining Co. operated its 2,000-ton flotation mill at Stibnite, Valley County, continuously on gold-silver-antimony ore from the Yellow Pine mine and completed in August the construction of a smelter at Stibnite for reduction of the antimony and gold concentrates.

Mine production of metals in Idaho in 1949, by methods of recovery, in terms of recoverable metals

Method of recovery	Gold (fine ounces)	Silver (fine ounces)	Copper (pounds)	Lead (pounds)	Zinc (pounds)
Ore amalgamated	1,214	808			
Concentrates smelted	60,704	9,870,960	2,752,716	154,307,482	148,378,476

REVIEW BY COUNTIES AND DISTRICTS

ADAMS COUNTY

Leasing operations at two mines in the Seven Devils district in 1949 produced 54 tons of carbonate copper ore—41 tons from the Helena claim and 13 tons from the South Peacock claim.

BLAINE COUNTY

Little Wood River (Muldoon) District.—Operations at the Eagle Bird mine from April to November by Garfield Mines, Inc., produced 566 tons of ore containing 2 ounces of gold, 5,402 ounces of silver, 1,618 pounds of copper, 93,778 pounds of lead, and 54,157 pounds of zinc.

Mineral Hill and Camas District.—The Apache Mines Co. completed constructing a 100-ton flotation mill at the Bullion-Red Elephant property near Hailey in 1949 and during the latter half of the year treated 2,930 tons of zinc-lead ore. The rest of the district output was 70 tons of silver-lead ore produced from the Croesus, D. Day, and Queen Bess properties and 66 tons of zinc-lead ore from the Snoose and Queen Bess mines.

Warm Springs District.—Output of zinc-lead-silver ore from the Triumph mine of the Triumph Mining Co., the most important producer of gold, silver, copper, lead, and zinc in southern Idaho, increased from 35,552 tons in 1948 to 49,014 tons in 1949. All the ore, containing 4,515 ounces of gold, 545,795 ounces of silver, 434,795 pounds of copper, 5,737,157 pounds of lead, and 4,214,653 pounds of zinc, was shipped to milling plants in Utah, where it was reduced to 4,446 tons of lead concentrate, 4,180 tons of iron concentrate, and 3,044 tons of zinc concentrate. In addition, lessees shipped 102 tons of zinc-lead ore and 40 tons of silver ore from the Triumph mine dumps. The remainder of the district output was 56 tons of zinc-lead ore produced from the Boston-Idaho and Homestake properties and 25 tons of silver-lead ore from the Boulder, Hyndman Peak, Lead Metals, and Leilani properties.

BOISE COUNTY

Boise Basin District (Centerville, Placerville, Idaho City, Pioneerville, Quartzburg).—Suspension in March—after 15 years' operation—of bucket-line dredging on Granite Creek near Centerville by Baumhoff-Marshall, Inc., resulted in a marked decline in the output of gold from the Boise Basin district in 1949. In 1949 two bucket-line dredges produced 4,656 fine ounces of gold compared with 11,109 fine ounces in 1948. The chief producer in 1949 was the Idaho-Canadian Dredging Co., which operated its 6-cubic-foot bucket-line dredge on Moores Creek near Idaho City from March 15 to October 7, treating 1,150,000 cubic yards of gravel. Ground sluicing recovered 54 fine ounces of gold and 12 fine ounces of silver and suction dredging 11 ounces of gold and 1 ounce of silver from various claims. The lode output was 42 tons of silver ore produced from the Golden Age mine and 52 tons of gold ore from the Come-Back and Julianna mines.

Summit Flat District.—About 15 tons of gold ore were produced in 1949 from the Jessie and Rock Creek mines and treated in amalgamation mills.

Mine production of gold, silver, copper, lead, and zinc in Idaho in 1949, by counties and districts, in terms of recoverable metals

[1] Less than 1 ton.

BONNER COUNTY

Clark Fork District.—Three mines, Hope, Lawrence, and Whitedelf—produced 9,528 tons of ore in 1949, containing 5 ounces of gold, 22,248 ounces of silver, 2,000 pounds of copper, 648,950 pounds of lead, and 49,060 pounds of zinc. The Hope Silver-Lead Mines, Inc., treated 7,500 tons of lead ore in its 150-ton flotation mill, but milling of ore ceased May 2 owing to the drop in the price of lead. In addition, 71 tons of silver-lead ore were shipped direct to a smelter. Lessees operated the Whitedelf mine all year, treated 1,877 tons of lead ore in a 50-ton flotation mill, and shipped 7 tons of similar ore to a smelter. Lessees also worked the Lawrence mine and shipped 73 tons of silver-lead ore to a smelter.

Lakeview District.—The Lakeview Lease operated the Weber mine the last half of the year and shipped 5,793 tons of high-siliceous silver ore to the smelter at Tacoma, Wash.; and 800 tons of zinc-lead-silver ore produced from the property of the Idaho-Lakeview Mines Co. were treated by flotation.

Pend d'Oreille District.—Output in 1949 comprised 43 tons of zinc-lead ore produced from the Gold Coin mine, 11 tons of silver-lead ore from the Little Senator and Red Cliff claims, 5 tons of silver ore from the Brown Bear and Katherine claims, and 7 tons of old mill cleanings recovered from the Talache mill site.

BONNEVILLE COUNTY

Hydraulicking and sluicing at the Golden Queen and Stapleton claims in the Mount Pisgah district recovered 28 fine ounces of gold.

BOUNDARY COUNTY

During the summer months the Continental Mining Co. treated lead ore and old tailings from the Idaho-Continental property, 27 miles west of Porthill. About 15,000 tons of old tailings were treated in a 500-ton heavy-medium separation plant; the resulting lead middling and 5,000 tons of lead ore were treated in a 100-ton flotation mill. The mill yielded a total of 285 tons of concentrates, which contained 2 ounces of gold, 7,250 ounces of silver, 1,538 pounds of copper, 356,637 pounds of lead, and 20,000 pounds of zinc. In addition, 32 tons of zinc-lead ore and 16 tons of lead ore were shipped direct to a smelter.

BUTTE COUNTY

C. A. Dye worked the Sentinel mine near Howe in the Dome district a few months in 1949 and shipped 166 tons of zinc-lead ore to a smelter in Utah.

CAMAS COUNTY

Beaver Creek District.—Lessees (J. R. Davies & Sons) operated the Princess-Blue Ribbon mine near Fairfield in 1949, treated 463 tons of zinc-lead-gold ore in a gravity-flotation mill, and shipped 23 tons of gold-lead ore to a smelter.

Little Smoky District.—Output in 1949 was 60 tons of silver-lead ore produced from the King of the West mine and 12 tons of gold-silver-lead ore from the Smoky Bullion mine.

CLARK COUNTY

Output in 1949 was 35 tons of copper ore produced from the Valley View mine in the Birch Creek district.

CUSTER COUNTY

Alder Creek District.—In 1949 six mines in the Alder Creek district produced 3,901 tons of ore, which contained 52 ounces of gold, 28,273 ounces of silver, 30,586 pounds of copper, 925,448 pounds of lead, and 209,523 pounds of zinc. The principal output was 3,171 tons of lead-silver ore and 405 tons of zinc ore from the Homestake mine near Mackay operated by the White Knob Mining Co. The rest of the district output was 256 tons of lead ore from the Champion, George Washington, Horseshoe, and Sky View properties and 69 tons of copper ore from the Empire mine.

Bayhorse District.—The output of the Bayhorse district in 1949 was 19,971 tons of ore containing 60 ounces of gold, 91,039 ounces of silver, 24,268 pounds of copper, 2,351,872 pounds of lead, and 656,570 pounds of zinc. Zinc-lead ore from the Clayton mine, owned by the Clayton Silver Mines, continued to be the most important production in the district. The company reported that 14,502 tons of ore were treated in its 120-ton flotation mill, which yielded 817 tons of lead concentrate and 334 tons of zinc concentrate. The concentrates contained 17 ounces of gold, 46,772 ounces of silver, 9,300 pounds of copper, 1,076,943 pounds of lead, and 401,450 pounds of zinc. According to the annual stockholders' report of the company for 1949, the south ore shoot on the 400 level was found to be larger and of higher lead content than that mined above the 300 level. The large north ore shoot has been located on the 400 level, but its width and length are undetermined. The ore reserves should be greatly increased in 1950.

The remainder of the district output comprised 3,208 tons of lead ore from the Red Bird mine, 2,167 tons of lead-silver ore from the Ellis, McGregor, Saturday, Silver Rule, South Butte, and Turtle properties, 88 tons of high-grade lead-copper-silver ore from the Ramshorn mine, and 6 tons of zinc-lead ore from the Zodiac claim.

Boulder District.—Livingston Mines, Inc., operated its mine near Clayton all year and shipped 1,027 tons of ore containing 15 ounces of gold, 6,632 ounces of silver, 2,244 pounds of copper, 186,684 pounds of lead, and 195,666 pounds of zinc to reduction plants in Utah.

Seafoam (Greyhound) District.—Lessees operated the Mountain King mine during the summer months and shipped 170 tons of ore containing 12 ounces of gold, 3,992 ounces of silver, 1,215 pounds of copper, 49,112 pounds of lead, and 58,894 pounds of zinc. The rest of the district output was 12 tons of gold ore produced from the Parkin group.

Yankee Fork District.—Placer gold continued to be the most important output in the Yankee Fork district. Jordan Placers, Inc., operated its dragline and nonfloating washing plant on Jordan Creek from May 15 to October 28 and treated 230,000 cubic yards of gravel, which yielded 2,957 fine ounces of gold and 1,907 fine ounces of silver. The lode output of the district was mainly 47 tons of gold-silver ore produced from the Altura and Lucky Boy properties.

ELMORE COUNTY

Bear Creek (Rocky Bar) District.—In 1949 two mines—Empire and Good Luck—in the Bear Creek district produced 25 tons of gold ore.

Middle Boise (Atlanta) District.—Gold ore from the Boise-Rochester-Monarch group at Atlanta continued to be the principal production in the Middle Boise district. The Talache Mines, Inc., operated the group and its 400-ton amalgamation and concentration mill throughout the year. The Company reported that 12,104 tons of ore were milled in 1949, which yielded 3,102 ounces of gold and 15,233 ounces of silver, compared with 10,370 tons of ore milled in 1948, which yielded 2,563 ounces of gold and 11,227 ounces of silver.

GEM COUNTY

Gold ore from the Dewey property at Pearl (West View district) was the only output in 1949 in Gem County. The Gem State Consolidated Mines, Inc., operated the property all year, constructed a 25-ton amalgamation and concentration mill, treated 200 tons of gold ore, and shipped 13 tons of similar ore. The ore yielded 151 ounces of gold, 242 ounces of silver, 1,906 pounds of lead, and 1,691 pounds of zinc.

IDAHO COUNTY

Burgdorf-Marshall Lake District.—Placer gold continued to be the chief production in the Burgdorf-Marshall Lake district. Hydraulicking and sluicing at the Golden Rule claim recovered 45 fine ounces of gold and 11 fine ounces of silver, and suction dredging at the Laughing Water (Ruby Meadows) group recovered similar quantities of gold and silver. Other placer producers were the Rock Creek and Secesh claims.

Dixie District.—George Grebe continued to work the Mammoth mine and recovered 56 fine ounces of gold and 21 fine ounces of silver from treating 40 tons of ore by amalgamation.

Elk City District.—All output in 1949 was placer gold and silver from five properties. The principal producer was the Warren Dredging Corp., which operated a 4-cubic-foot bucket-line dredge on American River from February 17 to December 19; 1,056,576 cubic yards of gravel were treated, yielding 5,446 fine ounces of gold and 875 fine ounces of silver. A dragline and floating washing plant were operated also on American River by the Tyee Mining Co., which treated 350,000 cubic yards of gravel. H. & H. Mines operated a 2-cubic-foot bucket-line dredge on Red Horse Creek in May and June and recovered 132 fine ounces of gold and 29 fine ounces of silver. The remainder (50 ounces) of the district gold output came from the Hawk and Summers Dream placers.

Lower Salmon River District.—Sluicing at three properties near Keuterville recovered 55 fine ounces of gold and 10 fine ounces of silver. The principal producers were the Sunshine and Dickerson placers.

Ten Mile District.—In 1949 one placer and three lode properties were worked in the Ten Mile district. South Fork Placers operated a dragline and floating washing plant on the South Fork of the Clearwater River from July 10 to October 20 and recovered 379 fine ounces of gold and 74 fine ounces of silver. The rest of the district output

was 111 ounces of gold, 53 ounces of silver, and 200 pounds of lead recovered from treating 393 tons of gold ore from the Bob, Haystack, and Lone Pine mines near Golden.

LEMHI COUNTY

Blue Wing District.—The 150-ton concentrator (destroyed by fire in December 1947) at the Ima mine at Patterson was rebuilt in 1948 by the Bradley Mining Co. The mill began operating in January 1949 and during the year treated 32,243 tons of ore containing 2.028 ounces of silver to the ton and 0.507 percent tungsten (WO_3), as well as a little copper and lead. Lead-copper-silver concentrate (1,066 tons) was shipped to smelters in Utah and tungsten concentrate (225 tons) to various destinations.

Eureka District.—Output in 1949 was mainly 194 tons of copper ore produced from the old Pope Shenon mine near Salmon.

Gibbonsville District.—The principal production in the Gibbonsville district in 1949 was 37 ounces of gold cleaned up from former dredging operations.

Junction District.—In 1949 four mines—Blue Lead, Galena, Leona, and Owl & Owl—in the Junction district produced 61 tons of ore containing 538 ounces of silver, 123 pounds of copper, 27,101 pounds of lead, and 775 pounds of zinc.

Mineral Hill District.—Output in 1949 was 6 tons of mill cleanings (gold) recovered from the Gold Hill mill and 1 ton of high-grade gold ore produced from the Monolith mine near Shoup.

Nicholia District.—Asa W. Reid operated the Viola mine all year and shipped 527 tons of ore to smelters in Utah; the ore contained 4 ounces of gold, 3,530 ounces of silver, 1,100 pounds of copper, 283,527 pounds of lead, and 89,243 pounds of zinc. The rest of the district output was 504 tons of old slag (containing largely lead and zinc) shipped from the dump at Nicholia.

Rattlesnake Creek District.—Leasing operations at the Twin Peaks mine 21 miles south of Salmon produced 395 tons of lead ore; most of it was treated in a flotation mill.

Spring Mountain District.—Output in 1949 was principally 34 tons of old slag containing silver, copper, lead, and zinc and 15 tons of lead-copper-silver ore produced from the Mikado claim near Gilmore.

Texas District.—Joe Hamilton operated his Hill Top mine near Gilmore all year and shipped 1,038 tons of ore containing 258 ounces of gold, 12,738 ounces of silver, 7,743 pounds of copper, 296,575 pounds of lead, and 60,000 pounds of zinc. The remainder of the district output was largely 280 tons of oxide lead-silver ore produced from the Latest Out mine.

Yellow Jacket District.—Output in 1949 was mainly old tailings (70 tons) containing gold and silver from the Yellow Jacket property near Forney.

OWYHEE COUNTY

Carson or French (Silver City) District.—In 1949 a dragline and a concentration plant were used by a lessee to recover gold at the Lewis placer property; about 10,000 cubic yards of gravel were treated, which yielded 42 fine ounces of gold and 41 fine ounces of silver. The

rest of the district output was mainly 5 tons of gold ore produced from the Perseverance mine.

SHOSHONE COUNTY—COEUR D'ALENE REGION

The drop in the prices of lead and zinc in 1949, coupled with a strike at the Bunker Hill smelter from August 20 to November 14, resulted in substantial decreases in the output of each metal in the Coeur d'Alene region (Shoshone County)—the chief source of silver, copper, lead, and zinc in Idaho. By the middle of June the prices of lead and zinc had declined so low that some operators working on low-grade zinc-lead ore and old tailing deposits ceased operations and the large producers curtailed operations. On January 1 the price of lead was 21.5 cents a pound and zinc 17.5 cents a pound; at the close of the year lead was 12 cents a pound and zinc 9.75 cents a pound. In 1949 the output of gold decreased more than 27 percent from 1948, silver 14, copper 16, lead 10, and zinc 11. The value of the metal output of the region was $50,699,924 (90 percent of the State value), a decrease of $11,469,031 (18 percent) from 1948. Although the State lead output exceeded the zinc output, it was the reverse in the Coeur d'Alene region, where the zinc output exceeded that of lead by only 435,200 pounds (less than one-half percent). The region remained the largest silver-producing area in the United States and ranked second in lead and zinc; it produced 91 percent of Idaho's silver, 81 percent of the copper, 94 percent of the lead, and 97 percent of the zinc. The chief producers of zinc in the region in 1949, according to rank, were the Star, Page, Morning, Sidney, Bunker Hill & Sullivan, Frisco, Amazon-Carlisle, Spokane-Idaho, and Highland-Surprise properties. The chief producers of lead, according to rank, were the Bunker Hill & Sullivan, Page, Star, Morning, Sherman and Sidney properties. The chief producers of silver, according to rank, were the Sunshine, Bunker Hill & Sullivan, Polaris, Page, Silver Dollar, and Sherman properties.

Of the total material (2,282,614 tons) produced in 1949 in the Coeur d'Alene region, 81 percent was zinc-lead ore and old tailings, 11 percent silver-lead ore, 6 percent silver ore, and 2 percent zinc ore and slag. Twenty-nine mills, with an aggregate capacity of 12,700 tons of ore a day, operated in the region in 1949.

Mine production of gold, silver, copper, lead, and zinc in the Coeur d'Alene region, Shoshone County, 1948–49, and total 1884–1949, in terms of recoverable metals

Year	Mines producing		Ore (short tons)	Gold (lode and placer, fine ounces)	Silver (lode and placer, fine ounces)	Copper (pounds)	Lead (pounds)	Zinc (pounds)	Total value
	Lode	Placer							
1948	65	7	3,165,780	3,362	10,598,338	2,775,000	165,174,000	167,601,000	$62,168,955
1949	61	1	2,282,614	2,438	9,146,146	2,341,000	148,304,000	148,739,200	50,699,924
Total 1884–1949			(1)	401,674	461,256,814	[2] 69,235	[2] 5,761,866	[2] 1,434,288	1,285,021,193

[1] Figure not available.
[2] Short tons.

Beaver District.—In 1949 eight mines in the Beaver district produced 141,550 tons of ore containing 183 ounces of gold, 112,487 ounces of silver, 118,976 pounds of copper, 5,115,108 pounds of lead, and 13,113,770 pounds of zinc. The principal output was 94,588 tons of zinc-lead ore produced from the Amazon-Carlisle-Interstate-Silver Tip groups by Day Mines, Inc.; the ore was treated in the Carlisle 500-ton flotation mill near Wallace. Lessees worked the Parrott mine, owned by Day Mines, Inc., and hauled 6,219 tons of zinc-lead ore to the Hercules and Golconda custom flotation mills, also near Wallace. According to the annual stockholders' report of Day Mines, Inc., for 1949, ore breaking at the Amazon-Carlisle group ceased August 31 owing to the low prices of lead and zinc. The Sunset Lease (a partnership in which Day Mines, Inc., has a 70-percent interest) operated the Sunset mine throughout the year and hauled 21,584 tons of zinc-lead ore to custom mills near Wallace. However, ore breaking in the mine ceased in June owing to a drop in prices of lead and zinc. Zanetti Bros. operated the waste dump at the Sunset property and the Rex flotation mill near Wallace; 1,430 tons of zinc-lead ore from the dump were hauled to the mill for treatment. Zanetti Bros. also operated the waste dump at the Interstate property and hauled 16,672 tons of low-grade zinc-lead ore to the Rex mill. The remainder of the district output was 1,057 tons of lead ore produced from the Blue Grouse, Idora, and Sitting Bull properties.

Evolution District.—The output of the Evolution district in 1949 comprised 250,814 tons of zinc-lead old tailings, 152,816 tons of silver-lead ore, 10,050 tons of silver ore, 1,562 tons of silver-antimony ore, and 90 tons of mill cleanings (lead). Most (194,495 tons) of the old tailings came from the Big Creek deposit and Osburn dump; all the silver-lead ore and 3,211 tons of silver ore from the Chester vein, Silver Syndicate fault zone, Yankee Girl vein, and Sunshine vein, operated by the Sunshine Mining Co.; 6,839 tons of silver ore from the Silver Summit mine; and all the silver-antimony ore from the Mineral Point mine. The Chester vein and Silver Syndicate fault zone include property owned by the Sunshine Mining Co., Polaris Mining Co., Silver Dollar Mining Co., and Silver Syndicate, Inc., and the Yankee Girl vein includes property owned by the Sunshine Mining Co., Sunshine Consolidated Mining Co., and the Metropolitan Mines Corp.; but all exploration, development, mining, and milling of ore are done by the Sunshine Mining Co. The Sunshine Mining Co. reported that the total output of ore in 1949 was 156,027 tons (89,089 tons for Sunshine account and 66,938 tons for account of Polaris, Silver Dollar, Silver Syndicate, Sunshine Consolidated, and Metropolitan) compared with 148,339 tons in 1948. The 1,350-ton Sunshine flotation mill operated 237 days on ore averaging 30.89 ounces of silver to the ton, 2.47 percent lead, and a little copper and zinc. The tailings averaged 0.57 ounce of silver to the ton and 0.06 percent lead; lead recovery was 98.3 percent and silver 97.9 percent. Lead-silver concentrates (15,083 tons) contained 4,742,708 ounces of silver, 1,246,132 pounds of copper, 7,544,502 pounds of lead, and 525,000 pounds of zinc, of which the net for Sunshine account was 2,682,519 ounces of silver, 753,638 pounds of copper, and 3,165,822 pounds of lead. The average operating costs for the year per ton were $12.10 for mining, $0.90 for milling, $0.23 for

depreciation, and $3.78 for general expense—a total of $17.01 compared with $16.55 in 1948. According to the annual report of the Sunshine Mining Co., mining operations were suspended from September 8 to November 21, owing to a labor strike in the district which began with closing of the Bunker Hill smelter August 20. As a result of this interruption, production of the mine for the year was about 75 percent of what it might have been. Development in 1949 comprised 2,876 feet of drifting, 2,673 feet of crosscutting, and 2,562 feet of raising. Developed ore reserves are estimated at 1,090,000 tons above the 3,700-foot level. This estimate includes the total estimated reserves in areas in which other companies share the production.

The Federal Mining & Smelting Co. worked the Big Creek tailing deposit all year and hauled 99,600 tons of zinc-lead old tailings to the Polaris mill at Osburn. The concentrates (2,629 tons) contained 32 ounces of gold, 63,154 ounces of silver, 48,500 pounds of copper, 1,316,804 pounds of lead, and 1,692,330 pounds of zinc. Zanetti Bros. worked the Osburn tailing deposit all year and hauled 94,895 tons of zinc-lead old tailings to the Polaris mill. The tailings contained an average of 0.907 ounce of silver to the ton, 1.233 percent lead, and 1.343 percent zinc. Zanetti Bros. also worked the DeBlock tailing deposit at the mouth of Lake Gulch and hauled about 24,000 tons of zinc-lead old tailings to their Galena mill. About 30,600 tons of similar tailings from the Burlett-Heller property were treated in the Coeur d'Alene Mines Corp. mill near Osburn by the Shoshone Leasing Co.

Development and exploration at the Silver Summit mine of the Silver Summit Mining Co. were done in 1949 by the Polaris Mining Co. on a cooperative basis between the two companies. During the year 6,839 tons of ore—containing 201,480 ounces of silver and 95,706 pounds of copper—were produced from the mine and treated in the Polaris mill. According to the annual report of the Polaris Mining Co., development at the Silver Summit mine in 1949 exposed 467 feet of very good grade ore on the 3,200-foot level.

According to the annual report of the Coeur d'Alene Mines Corp. for 1949, operations at the Mineral Point mine were confined mainly to development, exploration, and maintenance. The only ore mined and treated was 1,562 tons containing 8,900 ounces of silver, 16,312 pounds of copper, and a little antimony. The rest of the district output was 1,731 tons of zinc-lead old tailings and 90 tons of mill cleanings (lead) salvaged from the mill site of the Hecla Mining Co. at Osburn.

Hunter District (Mullan).—In 1949 six properties in the Hunter district produced 363,579 tons of ore and 872 tons of old tailings containing 478 ounces of gold, 718,725 ounces of silver, 341,683 pounds of copper, 29,449,396 pounds of lead, and 53,219,612 pounds of zinc. The Star mine of the Sullivan Mining Co. continued to be the principal producer, and in 1949 remained the largest producer of zinc in Idaho and ranked third in lead. The company operated the mine and its 1,000-ton flotation mill all year; the mill treated 230,241 tons of zinc-lead ore, yielding 7,339 tons of lead concentrate and 34,417 tons of zinc concentrate, which together contained 182 ounces of gold,

189,132 ounces of silver, 113,374 pounds of copper, 12,552,293 pounds of lead, and 35,454,872 pounds of zinc.

The Morning mine and 1,250-ton flotation mill of the Federal Mining & Smelting Co. at Mullan were operated continuously and at a higher rate than in 1948, because of an adequate supply of mine labor. The company reported that 87,757 tons of mine ore were treated in 1949 compared with 71,261 tons in 1948; the ore contained an average of 2.12 ounces of silver to the ton, 6.91 percent lead, and 8.22 percent zinc. According to the annual stockholders' report of the company for 1949, there is little chance of developing further appreciable tonnages of ore in the Morning mine above the 4,850-foot level. Present ore reserves at the current rate of production are sufficient for only 3 years' operation. The present shaft must be continued down to the 5,050-foot level if ore below the 4,850-foot level is to be mined. Ore reserves at the end of the year—above the 4,850-foot level—were estimated at 269,000 tons.

The Gold Hunter Mines, Inc., worked its mine at Mullan until April 10 when it was closed, but the company 500-ton flotation mill continued operating on waste-dump ore and old tailings until October 30. The company reported that 9,710 tons of mine ore and 13,350 tons of dump ore and old tailings were treated in 1949, which together yielded 717 tons of concentrates containing 40,038 ounces of silver, 2,200 pounds of copper, 693,530 pounds of lead, and 153,690 pounds of zinc.

The Lucky Friday Silver-Lead Mines Co. worked its mine continuously and hauled 15,083 tons of ore—containing an average of 14.58 ounces of silver to the ton, 4.11 percent lead, and 1.29 percent zinc—to the Golconda custom flotation mill. The remainder of the district output was largely 7,342 tons of zinc-lead-silver ore produced from the Golconda mine.

Lelande District (Burke, Mace, Frisco).—The output of the Lelande district in 1949 was 180,443 tons of ore and old tailings containing 314 ounces of gold, 474,021 ounces of silver, 129,828 pounds of copper, 16,476,079 pounds of lead, and 14,320,406 pounds of zinc. The most important producer was the Sherman mine of Day Mines, Inc. The company reported that 55,647 tons of ore containing an average of 6.10 ounces of silver to the ton, 9.12 percent lead, and 1.98 percent zinc were treated in the Sherman 300-ton flotation mill near Burke. The mine was closed from October 4 to November 22 because of a labor strike in the district.

The lower levels of the Frisco mine were worked by the Federal Mining & Smelting Co. and the upper levels by the Hull Lease. From the lower levels, 48,572 tons of zinc-lead ore (containing an average of 1.39 ounces of silver to the ton, 4.43 percent lead, and 6.69 percent zinc) were hauled to the Morning mill at Mullan for treatment. From the upper levels, the Hull Lease treated in its own 90-ton flotation mill 26,575 tons of ore, containing an average of 0.44 ounce of silver to the ton, 0.88 percent lead, and 7.86 percent zinc. The mine was closed from September 7 to November 22 because of a labor strike. The Federal Mining & Smelting Co. estimated the ore reserves at the Frisco mine at the end of 1949 to be 196,080 tons.

In April and May, 24,118 tons of old tailings (containing 0.67 ounce of silver to the ton, 0.96 percent lead, and a little copper and zinc)

from the West Star property were treated in the Hecla flotation mill at Gem. About 14,450 tons of zinc-lead old tailings deposited along Canyon Creek near Wallace were hauled to the Hercules and Golconda custom mills for treatment. The rest of the district output was mainly 10,296 tons of zinc-lead ore produced from the Hercules and Black Bear mines near Burke.

Placer Center District.—The output of the Placer Center district in 1949 was 149,673 tons of ore and 18,332 tons of old tailings, which contained 180 ounces of gold, 303,413 ounces of silver, 85,200 pounds of copper, 11,207,394 pounds of lead, and 7,537,162 pounds of zinc. The principal producer was the Tamarack mine of Day Mines, Inc. The company reported that 60,765 tons of ore containing an average of 1.08 ounces of silver to the ton, 3.29 percent lead, and 4.53 percent zinc were treated in the Tamarack flotation mill at Dorn. The mine was closed from October 4 to November 22 because of a labor strike. Day Mines, Inc., also operated its Dayrock mine and 350-ton flotation mill at Bunn. The mill treated 50,110 tons of ore containing an average of 3.17 ounces of silver to the ton, 4.92 percent lead, and 0.42 percent zinc. During the first quarter of the year 34,350 tons of waste-dump ore (containing an average of 1.45 ounces of silver to the ton, 1.96 percent lead, and 0.47 percent zinc) from the Rex property were hauled to the Hecla mill at Gem for treatment. The remainder of the district output was 18,332 tons of zinc-lead old tailings from the Nine Mile, Tomsche, and Woodland properties and 4,448 tons of zinc-lead ore from the Success and Tamarack No. 5 mines operated by lessees.

Summit District (Murray).—About 400 tons of zinc-lead ore were produced in 1949 from the Anchor mine near Murray and 100 tons of gold ore from the Golden Chest mine. Placer gold (13 ounces) was recovered by sluicing at the Gardner claim on Pritchard Creek.

Yreka District (Kellogg).—The value of the metal output of the Yreka district was $23,904,333 in 1949, a loss of $5,392,786 (18 percent) from that in 1948. In spite of this loss the value was more than double that of any other district in Idaho; the district remained by far the chief lead- and zinc-producing area in Idaho and ranked second in silver. In 1949 material produced from the district comprised 680,945 tons of zinc-lead-silver ore, 245,633 tons of old zinc-lead tailings, 43,577 tons of old zinc-lead-iron tailings, 22,389 tons of old zinc slag, 14,897 tons of lead ore, and 4,861 tons of siliceous silver tailings—a total of 1,012,302 tons compared with 1,171,090 tons in 1948. Of the total ore, old tailings, and old slag, 381,940 tons (containing 1,234 ounces of gold, 976,949 ounces of silver, 404,000 pounds of copper, 36,994,835 pounds of lead, and 56,676,517 pounds of zinc) were zinc-lead-silver ore from eight mines in the Pine Creek area of the district; the Page and Sidney mines were the chief producers. However, the Bunker Hill & Sullivan mine at Kellogg, with an output of 299,005 tons of zinc-lead-silver ore and 14,850 tons of lead ore in 1949, continued to be the most important producer of ore in the district, the largest producer of lead in the State, ranked second in silver, and fifth in zinc. The company main 2,000-ton flotation mill, equipped with sink-and-float unit, treated 299,005 tons of zinc-lead-silver ore from the Bunker Hill & Sullivan mine and 245,633 tons of old zinc-lead tailings from the Bunker Hill & Sullivan mill tailing dump. The ore contained an average of 5.44

ounces of silver to the ton, 7.34 percent lead, and 2.06 percent zinc, and the old tailings 0.76 ounce of silver to the ton, 1.39 percent lead, and 0.66 percent zinc. John George continued leasing operations in the upper levels of the Bunker Hill & Sullivan mine and treated about 14,850 tons of lead ore in his mill. The Bunker Hill & Sullivan Mining & Concentrating Co. also treated 43,577 tons of old jig tailings (containing 1.02 ounces of silver to the ton, 2.29 percent lead, 1.01 percent zinc, and 13.30 percent iron) in its 300-ton gravity-flotation plant and shipped 22,389 tons of old Bunker Hill smelter slag (containing 0.375 ounce of silver to the ton, 1.84 percent lead, and 12.20 percent zinc) to its lead smelter at Bradley. The resulting hot slag was sent to the company slag-fuming plant, also at Bradley, to recover the zinc. According to the company annual report to stockholders, there were produced and recovered from Bunker Hill & Sullivan mine ore (including lessee ore) 1,584,383 ounces of silver, 43,541,540 pounds of lead, and 10,564,300 pounds of zinc. A labor strike at the Bunker Hill smelter, which began August 20, caused closing of the Bunker Hill & Sullivan mine from August 31 to November 14, after 50 years of continuous production. An important discovery was made during the year of a heretofore unknown ore body in relatively unmined territory on the Bunker Hill No. 17 level. The extent of this large body of high-grade lead-silver ore is not yet proved. Ore reserves fully developed and ready for mining January 1, 1950, totaled 2,963,084 tons of zinc-lead-silver ore, a decrease of 63,800 tons from January 1, 1949. The zinc slag-fuming plant of the Bunker Hill & Sullivan Mining & Concentrating Co. at Bradley ran continuously until August 20, when it closed because of a strike at the Bunker Hill lead smelter. In 1949 the plant received 81,781 tons of current hot slag from the lead furnaces of the Bunker Hill smelter at Bradley; the resulting zinc-lead fume (3,068 tons) was sent to the Bunker Hill lead smelter, and the zinc fume (12,589 tons) was shipped to smelters in Kansas and Texas. All of the lead and zinc produced at the plant in 1949 was credited to the mines and an old slag dump furnishing the slag-making material.

Output of zinc-lead-silver ore from the Page mine of the Federal Mining & Smelting Co. declined from 158,179 tons in 1948 to 154,230 tons in 1949. The ore, treated in the Page 500-ton flotation mill, contained an average of 4.03 ounces of silver to the ton, 6.87 percent lead, and 7.13 percent zinc. The mine ranked second in lead and zinc production in Idaho in 1949 and fourth in silver. According to the company annual report to stockholders, operations at the Page mine were continuous throughout the year. A surplus of mine labor developed toward the end of the year, and all crews were full. Development of the 2,770-foot level of the Tony vein has not been completed, but results to date are equally as good as those on the 2,400-foot level. Ore reserves at the end of the year were estimated at 911,026 tons, an increase of 58,344 tons over the estimated tonnage at the end of 1948.

The Sidney Mining Co. operated its mine on Denver Creek all year, but the company 250-ton flotation mill was idle from August 20 to November 20. Output of zinc-lead-silver ore from the mine declined from 89,724 tons in 1948 to 63,499 tons in 1949; the ore contained an average of 2.77 ounces of silver to the ton, 5.72 percent lead, and 9.71 percent zinc. The Highland-Surprise Consolidated Mining Co.

worked its mine on Stewart Creek from January 1 to September 9 and from December 1 to December 31. Zinc-lead ore treated in the company 300-ton flotation mill dropped from 72,925 tons in 1948 to 52,255 tons in 1949. Mining and milling of zinc-lead ore from the Spokane-Idaho mine on Pine Creek were continuous throughout the year. The company 175-ton flotation mill treated 50,623 tons of zinc-lead ore in 1949 compared with 54,917 tons in 1948. The Sunset Minerals, Inc., operated the Liberal King mine on Pine Creek all year and treated 24,596 tons of zinc-lead ore in its 100-ton flotation mill, compared with 24,586 tons in 1948. Output of zinc-lead ore from the Little Pittsburg mine on Denver Creek declined from 22,139 tons in 1948 to 15,726 tons in 1949; the ore was treated in the Denver Development Co. 150-ton flotation mill. The rest of the district output was mainly zinc-lead ore (21,000 tons) produced from the Douglas and Nabob mines on Pine Creek.

VALLEY COUNTY

Yellow Pine District.—The Bradley Mining Co. operated its Yellow Pine mine and 2,000-ton flotation mill at Stibnite all year. The company reported that in 1949 the mill treated 610,988 tons of ore containing 0.112 ounce of gold and 0.209 ounce of silver to the ton, and 0.344 percent antimony. The antimony concentrates (4,558 tons) and gold concentrates (20,404 tons) contained 53,576 ounces of gold, 92,439 ounces of silver, and 3,163,735 pounds of antimony. Gold production in 1949 was nearly double that of 1948, but production of silver and antimony was much less. In 1949 the mine produced 69 percent of Idaho's gold output. Construction of a smelter at Stibnite, for reduction of the antimony and gold concentrates produced at the company mill, was completed in August.

WASHINGTON COUNTY

All the output in Washington County in 1949 was 3,160 ounces of silver and 1 ounce of gold recovered from treating 4 tons of old mill cleanings at Mineral in the Washington district.

Missouri, Oklahoma, Kansas, and Arkansas
Silver, Copper, Lead, and Zinc

(MINE REPORT)

By A. J. Martin

GENERAL SUMMARY

ECONOMIC conditions affecting lead and zinc mining in Missouri, Oklahoma, Kansas, and Arkansas were erratic in 1949. From January to March production trended upward, as the market prices of lead and zinc were high enough in relation to the cost of labor and materials—a situation stimulating the mining of lower-grade ores, of which there are large reserves. In March the monthly production was the highest since April 1946 for lead and since June 1947 for zinc. The production trend was reversed by a downward movement in metal prices that began in March and culminated in a 44-percent decrease in the lead price by May 26 and a 49-percent decline in zinc by June 15. In the Tri-State zinc-lead district of southwestern Missouri, Oklahoma, and Kansas—which contributed 99 percent of the four-State total output of zinc—the price of zinc concentrate declined from \$110 to \$50 a ton and lead concentrate from \$290.92 to \$148.63. The decline disrupted virtually all Tri-State operations, causing indefinite closing, temporary shutdown, or curtailment. Concentrate prices from July to December, although averaging higher than the June lows, were inadequate to enable the Tri-State mines to operate without a material reduction in costs. It was therefore necessary for mines that continued producing to reduce wages and to resort to selective mining. The total district production of zinc in 1949 was 7 percent less than in 1948 and the lowest since 1896.

Production of lead for the year was higher than in 1948 despite the sharp drop in the metal price. The large lead mines in the Southeastern Missouri region, which in 1948 were shut down 2½ months by labor strikes, operated continuously in 1949. In the Tri-State district selective mining resulted in the largest lead production there since 1943. The increase in the four States' total output was 23 percent over 1948 and 2 percent over 1947, when the operating time of the Southeastern Missouri mines was normal.

Missouri has been a substantial producer of copper in recent years; the output in 1949 was the highest on record. Part of the copper was recovered from copper concentrates produced from lead-copper-(cobalt-nickel-iron) ore, and part was recovered as a byproduct in smelting lead concentrates. The Missouri output of silver is incidental to the production of lead and copper.

All tonnage figures are short tons and "dry weight"; that is, they do not include moisture.

The value of the metal production reported herein has been calculated at the following prices.

Prices of gold, silver, copper, lead, and zinc, 1945–49

Year	Gold [1] (per fine ounce)	Silver [2] (per fine ounce)	Copper [3] (per pound)	Lead [3] (per pound)	Zinc [3] (per pound)
1945	$35.00	$0.711+	$0.135	$0.086	$0.115
1946	35.00	.808	.162	.109	.122
1947	35.00	.905	.210	.144	.121
1948	35.00	.905+	.217	.179	.133
1949	35.00	.905+	.197	.158	.124

[1] Price under authority of Gold Reserve Act of Jan. 31, 1934. Treasury legal coinage value of gold from Jan. 18, 1837, to Jan. 31, 1934, was $20.67+($20.671835) per fine ounce.
[2] Treasury buying price for newly mined silver. 1945 to June 30, 1946: $0.71111111; July 1, 1946, to Dec. 31 1947: $0.905; 1948–49: $0.9050505.
[3] Yearly average weighted price of all grades of primary metal sold by producers. Price in 1945–47 includes bonus payments by Office of Metals Reserve for overquota production.

Mine production of silver, copper, lead, and zinc in Arkansas, Kansas, Missouri, and Oklahoma in 1945–48 and, by States, in 1949, in terms of recoverable metals

	Mines producing	Material sold or treated		Silver	
		Crude ore (short tons)	Old tailings (short tons)	Fine ounces	Value
1945	247	14,163.065	11,271,347	94,822	$67,429
1946	269	13,831,590	10,178,620	69,401	56,076
1947	254	11,837,403	6,041,783	93,600	84,708

Mine production of silver, copper, lead, and zinc in Arkansas, Kansas, Missouri, and Oklahoma in 1949, by months, in terms of recoverable metals

Month	Silver (fine ounces)	Copper (short tons)	Lead (short tons)	Zinc (short tons)
January	7,899	201	12,310	7,002
February	8,174	243	13,070	8,313
March	11,270	293	14,834	9,801
April	9,196	255	12,685	9,434
May	10,065	289	12,784	7,001
June	11,199	328	13,047	6,407
July	10,131	280	10,868	5,928
August	12,057	413	14,065	5,209
September	11,087	380	13,568	5,863
October	10,627	308	13,189	5,713
November	10,933	341	13,427	5,951
December	10,775	339	13,306	6,756
Total: 1949	123,413	3,670	157,153	79,378
1948	114,187	2,370	127,614	85,892

Silver.—Smelters treating southeastern Missouri lead concentrates continued to recover silver as a byproduct. These concentrates usually contain 1 to 2 ounces of silver a ton, but much of the silver goes into undesilverized lead and is not recorded as recoverable production. The copper concentrates made from lead-copper ore also contain some silver. The total silver recovered in 1949 was 123,413 fine ounces, compared with 114,187 ounces in 1948.

Copper.—The Missouri output of copper increased from 2,370 tons in 1948 to 3,670 tons in 1949. The production of copper concentrates by the Madison mill at Fredericktown, Madison County, which treats lead-copper ore, showed a large gain over 1948. The quantity of copper contained in byproduct matte shipped from smelters treating lead concentrates also increased.

Lead.—The production of recoverable lead in the four States in 1949 totaled 157,153 tons, comprising 126,269 tons from the Southeastern Missouri region, 30,883 tons from the Tri-State district, and 1 ton from Arkansas. In 1948 the output totaled 127,614 tons and comprised 100,654 tons from the southeastern Missouri region, 26,901 tons from the Tri-State district, 37 tons from the central Missouri region, and 22 tons from Arkansas. The large lead mines in southeastern Missouri operated continuously in 1949, whereas in 1948 they were shut down 2½ months by a labor strike. The increase in lead production in the Tri-State district resulted largely from selective mining of ore bodies of higher than average lead content after the price of zinc declined below the level required for mining low-grade, predominantly zinc ore.

Zinc.—The 79,378 tons of recoverable zinc produced in the West Central States in 1949 comprised 78,628 tons from the Tri-State district, 749 tons from southeastern Missouri, and 1 ton from Arkansas. In 1948 the Tri-State output was 84,839 tons, southeastern Missouri 1,022 tons, and Arkansas 31 tons—a total of 85,892 tons. The decrease in 1949 is attributable to curtailed operations at many mines and temporary or indefinite shut-downs at others caused by the nearly 55-percent decline in the quoted price of zinc concentrates at Joplin from March to June, with fluctuations near the lower level the rest of the year.

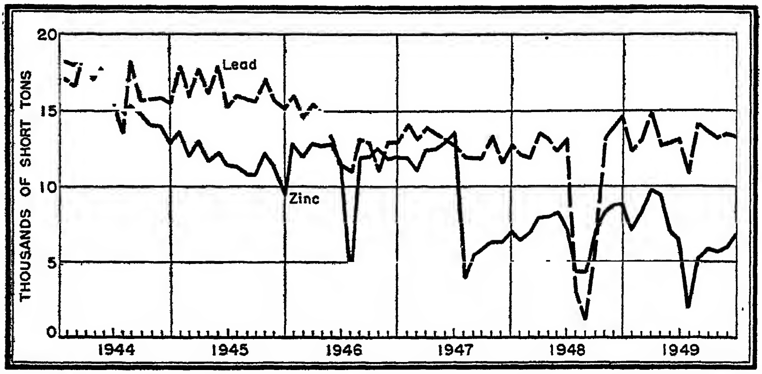

FIGURE 1.—Mine production of lead and zinc in Arkansas, Kansas, Missouri, and Oklahoma, 1944–49, by months, in terms of recoverable metals.

MINING AND METALLURGIC INDUSTRY

The tonnage of crude lead ore mined in southeastern Missouri in 1949 exceeded that of zinc-lead ore produced in the Tri-State field. The Tri-State tonnage was higher in all except three of the other years since individual mine production records were made available in 1907. The principal lead mines operated steadily throughout 1949, despite the sharp drop in the market price of lead, whereas few, if any, of the Tri-State zinc-lead mines could maintain production rates on the scale that prevailed before the break in metal prices in March necessitated abandonment of many headings in low-grade ore. Details of the effect on the Tri-State mining industry of the decline in prices of concentrate are given in a following section of this chapter.

Large-scale exploratory drilling by the mining companies was confined to the Southeastern Missouri region, but scattered drilling continued in the Tri-State district. The Bureau of Mines carried on drilling projects in the Tri-State district and made field examinations and metallurgical tests on ores from various districts in the four States.

Seven mills were operating in the Southeastern Missouri region and 20 in the Tri-State district in December 1949 compared with 8 and 36, respectively, in 1948. The 27 mills active in December 1949 had daily capacities ranging from 60 to 15,000 tons and averaged 2,278 tons. Gravity concentration and flotation were used in nearly all the mills. Flotation concentrates comprised 44 percent of the total lead concentrates and 66 percent of the zinc concentrates produced. The active smelters were the lead smelters at Galena, Kans., and Herculaneum, Mo.; the zinc smelters at Bartlesville, Blackwell, and Henryetta, Okla., and Fort Smith, Ark.; and the oxide plant at Coffeyville, Kans.

ORE CLASSIFICATION

The following table classifies the combined ore and old tailings produced in Arkansas, Kansas, Missouri, and Oklahoma in a manner comparable to the classes shown in the tables on ore classification in the chapters devoted to mining in the Western States. The basis for classification is given in the Gold and Silver chapter of this volume. Additional details of the tenor of ore and old tailings milled and the concentrates produced in Kansas, Missouri, and Oklahoma are given

in tables in the Tri-State District and Review by States sections that follow. Such tables for Arkansas are omitted because only small-scale intermittent mining of lead and zinc was done there from 1918 through 1949.

Ore and old tailings sold or treated in Arkansas, Kansas, Missouri, and Oklahoma in 1949, with content in terms of recoverable metals

Source	Mines producing	Ore, etc. (short tons)	Silver (fine ounces)	Copper (short tons)	Lead (short tons)	Zinc (short tons)
Lead ore [1]	54	7,174,258	123,413	3,670	129,007	871
Zinc ore [2]	55	2,349,555			1,235	21,740
Zinc-lead ore	123	3,616,034			26,911	56,767
Total: 1949	232	13,139,847	123,413	3,670	157,153	79,378
1948	294	12,298,055	114,187	2,370	127,614	85,892

[1] Includes lead-copper ore from 1 mine; also, 1,409,098 tons of old tailings remilled, concentrates from which were mixed with those from crude ore.
[2] Includes 1,602,620 tons of old tailings yielding 4,217 tons of recoverable zinc and 29 tons of lead.

TRI-STATE DISTRICT

For the first 3 months of 1949 production of zinc and lead concentrates in the Tri-State district trended upward, and the output in March was the highest since June 1947. During the next 3 months production decreased heavily as a result of successive sharp declines in the prices of concentrates. About 50 of the mines shut down, and most of the other 76 that were active curtailed production. The decrease in the June output compared with March was 35 percent

Production of lead and zinc concentrates in the Tri-State district (Kansas, Oklahoma, and southwestern Missouri), 1945–49

Year	Ore, etc., milled (short tons)	Concentrates produced (short tons)		Concentrate recovery (percent)		Average assay of concentrates (percent)		Average value per ton of concentrates

for zinc concentrates and 34 percent for lead concentrates. The July production of zinc concentrates, reduced to an exceptionally low level by previous shut-downs and a work stoppage at the mines and mills of the Eagle-Picher Mining & Smelting Co., was only 3,529 tons compared with 18,256 tons in the peak month of March. From August through December the monthly production of zinc concentrates averaged 10,891 tons and lead concentrates 3,552 tons.

The district total production in 1949 was 147,178 tons of zinc concentrates valued at $11,445,018 and 41,471 tons of lead concentrates valued at $7,824,788—a total value of $19,269,806 compared with $22,231,715 in 1948. The production of zinc concentrates in 1948 was 159,609 tons valued at $13,929,151 and that of lead concentrates 35,862 tons valued at $8,302,564. The output in 1949, in terms of recoverable metals, was 78,628 tons of zinc and 30,883 tons of lead compared with 84,839 and 26,901 tons, respectively, in 1948.

Weekly quoted prices for 60-percent zinc concentrates and 80-percent lead concentrates at Joplin, 1949

[1] After the price began declining March 26, the Eagle-Picher Mining & Smelting Co. paid $2.50 a ton above the quoted market price for zinc concentrates made from ore treated in the company Central mill.
[2] Nominal price.

The five leading zinc-producing companies in the Tri-State district in 1949, in order of output, were: Eagle-Picher Mining & Smelting Co. (Oklahoma and Kansas), Nellie B. Mining Co. (Oklahoma), National Lead Co. St. Louis Smelting & Refining Division (Kansas), Federal Mining & Smelting Co. (Oklahoma and Missouri), and Sooner Milling Co. (Kansas and Oklahoma). In lead production the companies ranked as follows: Eagle-Picher, Nellie B., Federal, National Lead, and the W. M. & W. Mining Co. (Oklahoma).

As nearly all the Tri-State mines depend upon low-grade ore reserves, those that operated after the drastic decline in concentrate prices had to reduce costs materially. Considerable saving had already been accomplished by improving techniques of mining, ore haulage, and milling. An article describing the use of trackless equipment underground by one company was published.[1] Employees did their part by accepting wage reductions and maintaining work efficiency.

In December about 85 mines, 18 mine mills, 1 tailing mill, and 1 slime or clean-up mill were operating compared with 120, 29, 4, and 3, respectively, in December 1948. These mines do not include many

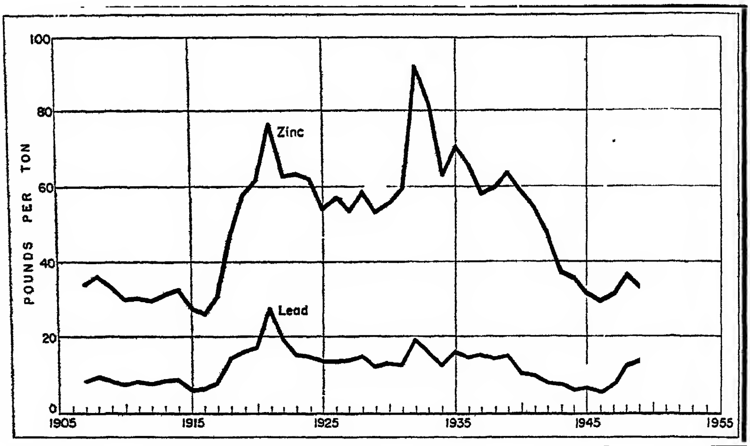

FIGURE 4.—Metal recovered per ton of crude ore (rock) milled in the Tri-State district, 1907–49.

small, intermittent producers; the total producing mines, gouges, and mill and dump clean-ups active all or part of 1949 was 216 compared with 270 in 1948. The depth of 122 operating shafts ranged from 30 to 450 feet and averaged 230 feet; open pits, worked at depths ranging from a few feet to 90 feet, yielded 120,000 tons of ore—less than 3 percent of the district total output of crude ore.

A few rigs were kept on exploratory drilling by the mining companies. The Bureau of Mines had drilling projects in the Canyon Diggings, Mo., and Melrose, Kans., areas. Data on certain drilling projects were published during the year.[2]

REVIEW BY STATES

MISSOURI

Missouri has been the chief lead-producing State for 42 consecutive years and until 1918 had ranked first in zinc production for many years. A summary of the State production of lead, zinc, copper, silver, and other minerals from the earliest records through 1947 was published in 1949.[3]

The principal lead mines are in the Southeastern Missouri district. Silver and copper are recovered as byproducts in smelting lead concentrates produced in this region, and copper and some silver have been recovered in some years (including 1944–49) from lead-copper-(cobalt-nickel-iron) ore mined in Madison County. Silver recoverable

[3] Bishop, O. M., The Mineral Industry of Missouri in 1946 and 1947, with Total Production Summarized: Missouri Div. of Geol. Surv. and Water Resources, Missouri Inf. Circ. 4, Rolla, 1949, 93 pp.

in 1949 totaled 123,413 fine ounces and copper 3,670 short tons compared with 114,187 ounces and 2,370 tons, respectively, in 1948. In the sale of the lead concentrates, no value is attached to the silver and copper, as the quantity recovered per ton of concentrates is very small. The zinc output comes largely from zinc-lead mines in southwestern Missouri. The Central district of Missouri had a small output of lead in 1945–48 and of zinc in 1945; the figures are included with those of southeastern Missouri in the table that follows.

Southeastern Missouri.—The principal lead mines in southeastern Missouri operated continuously in 1949; and production of lead increased 25 percent over 1948, when output was lower than usual because of work stoppages. The quantity of recoverable lead produced was 126,269 tons in 1949 and 100,654 tons in 1948. Zinc totaling 749 tons in 1949 and 1,022 tons in 1948 was recovered as a byproduct of lead mining and smelting.

In St. Francois County the St. Joseph Lead Co., largest producer of lead in the United States, operated its several large groups of mines and the Bonne Terre, Desloge, Federal, and Leadwood mills. The mills have a combined daily capacity of 26,800 tons. Treatment is by table concentration followed by flotation. The principal mine groups have underground, electrified, rail-haulage systems, which

Mine production of lead and zinc in Southeastern and Central Missouri districts, 1945–49

Year	Lead concentrates (galena)		Zinc concentrates (sphalerite)[1]		Metal content[2]			
					Lead		Zinc	
	Short tons	Value[3]	Short tons	Value	Short tons	Value	Short tons	Value
1945	245,805	$21,870,243	1,335	$45,706	173,053	$29,765,116	[4] 595	$136,850
1946	189,401	21,677,221	1,731	61,147	135,891	29,624,238	451	110,044

Average lead content of galena concentrates ...do	71.66	73.09	72.22	70.60	71.60
Average value per ton of galena concentrates	$88.95	$114.39	$173.49	$209.11	$181.75

[1] Includes lead-copper ore. Includes old tailings remilled: 1945-46—none; 1947—301,324 tons; 1948-1,164,356 tons; 1949—1,409,098 tons.

move the ore from the working faces to central ore-hoisting shafts. The four ore-hoisting shafts at the mills are 326, 276, 497, and 541 feet deep; the Doe Run shafts, from which ore is trucked to the Federal mill, are 160 and 179 feet deep. Other shafts are used for men, supplies, and waste rock. Development on the four groups in 1949 totaled 612 feet of shaft, 84,353 feet of drifting, 2,492,614 feet of diamond drilling, and 76,293 feet of churn drilling. The company also did exploratory drilling in adjacent counties. The following information was extracted from the company's eighty-sixth annual report to stockholders.

Further progress has been made during 1949 in modernizing underground facilities, and the effects of this program have already resulted in increased operating efficiency. Development work, during the year, was maintained in balance to the rate of mining. A new operating shaft, No. 22, which will open up the Hayden Creek orebody for exploitation, is virtually completed, and some production from this orebody is expected in 1950. It is planned to treat ore from this shaft, at the Leadwood Mill. The Desloge Mill continued throughout the entire year, to treat tailings; a total of 1,409,098 tons of tailings were milled at this plant and at the Company's Leadwood and Bonne Terre Mills. * * *

The lead bonus of 25 cents per shift worked for each one cent increase in the price of lead above 12 cents per pound in New York, which is applicable to all employees of this Division, continued in effect during the year. As lead prices declined, the bonus was from time to time reduced, and finally in December was frozen at a figure of 37½ cents per shift worked. No change was made in the basic wage rates. * * *

Approximately one-third of the Company's lead production in 1949 was smelted at Herculaneum and the balance of the production will continue, until 1953, to be smelted at East Alton, Illinois, when the present toll contract terminates with the American Smelting and Refining Company. The Herculaneum smelter was idle during the months of July and August, while replacements of worn-out flues and certain equipment were effected. The modernization program at this plant, which will continue through 1950, has already resulted in improvement in recoveries and some lowering of operating costs.

In Madison County the St. Joseph Lead Co. operated the Mine La Motte mine and 2,000-ton mill. Four shafts, 75, 116, 136, and 307 feet deep, were operated. Mine development during the year included 4,661 feet of drifts, 72,956 feet of diamond drilling, and 15,370 feet of churn drilling.

The National Lead Co. St. Louis Smelting & Refining Division operated its Madison lead-copper mine and 1,200-ton all-flotation mill at Fredericktown; the output of lead and copper concentrates showed a large increase over 1948. Four shafts, averaging 400 feet in depth, were used. The mine contains ore bodies that yield considerable iron, cobalt, and nickel with lead and copper, but operations in 1949 were confined chiefly to the mining of lead-copper ore. Development during the year included 67 feet of drifts, 1,194 feet of diamond drilling, and 58,928 feet of churn drilling.

The Catherine-Fleming mine was operated by the Park City Consolidated Mines Co. from January to March and by the Fredericktown Lead Co. the rest of the year. The Ruth mine of the Park City Consolidated Mines Co. was idle throughout 1949. The mill operated from January through March on ore from the Catherine-Fleming mine and was later sold for dismantling. In Jefferson County the

Fredericktown Lead Co. operated the leased Valle mine property during January and February and one week in May. Galena shipped from barite diggings in Washington and Jefferson Counties totaled 100 tons.

Southwestern Missouri.—The Tri-State district, which includes southwestern Missouri, is described in an earlier section of this chapter.

Production of zinc concentrates in southwestern Missouri in 1949 was the lowest since 1932; the decrease from 1948 was 8 percent. The Federal Mining & Smelting Co. Duenweg mine, operated about 10 months, was the largest producer of zinc in Missouri in 1949. The Dale Mining Co. Dungy mine at Stark City was the only substantial producer that operated continuously throughout the year; the company also operated the Ryder mine at Pioneer 3 months. Other properties that operated part of the year, mostly before the sharp declines in concentrate prices, included the Navy Bean mine and mill of the Consolidated Mines Co. near Wentworth, the Glen Richey Shinn mine at Stark City, the Federal Granby-American at Granby, the High Five at Waco, and the I. N. Clark Olsen mine at Spurgeon. At Aurora the Good Enuf Mining & Milling Co. built a 250-ton mill on the Good Enuf property and operated the mine and mill from September 29 through December. The St. Louis Mining & Milling Co. custom mill at Thoms Station operated intermittently; the largest shipper to the mill was the Lone Elm surface diggings, operated by W. O. York in January, February, and March. The Kansas Explorations Jasper mill operated about 4 months, treating custom ore from Galena, Kans. The Wildwood Mining Co. remodeled its Northside mill and treated considerable ore from "Mattes shaft" of the Wildwood property. The McNabb Coal Co. worked several months on stripping at the Quick 7 mine near Neck City and had test lots of ore treated in the Snapp mill. Ore from the Oronogo Circle dump was shipped to the Eagle-Picher Central mill at Cardin, Okla. The Bureau of Mines did exploratory drilling in the Canyon Diggings area.

Mine production of lead and zinc in southwestern Missouri, 1945–49

Year	Lead concentrates				Zinc concentrates				Metal content [1]			
	Galena		Carbonate		Sphalerite		Silicate		Lead		Zinc	
	Short tons	Value	Short tons	Value	Short tons	Value	Short tons	Value	Short tons	Value	Short tons	Value

Sphalerite concentrates	$87.39	$74.49	$80.38	$51.86
Zinc silicates and carbonates	$53.53	----------	$38.85	----------

[1] Figures represent metal content of the crude ore (or "dirt") only insofar as it is recovered in the concentrates; data on tailing losses not available.

OKLAHOMA

The Oklahoma output of recoverable zinc increased slightly (less than 1 percent) and lead increased 17 percent in 1949 from 1948. All the output in both years came from the area in Ottawa County in the northeastern corner of the State that is part of the Tri-State district. Factors affecting production in the district as a whole are discussed in an earlier section of this chapter. Oklahoma mines contributed 56 percent of the Tri-State district total output of zinc and 64 percent of the lead in 1949.

Mine production of lead and zinc in Oklahoma, 1945–49, and total, 1891–1949

Year	Lead concentrates (galena)		Zinc concentrates (sphalerite)		Metal content [1]			
					Lead		Zinc

[1] Figures represent metal content of the crude ore (or "dirt") only insofar as it is recovered in the concentrates; data on tailing losses not available.

The 15,000-ton Central mill of the Eagle-Picher Mining & Smelting Co. at Cardin treats company and custom ores from Oklahoma, Kansas, and Missouri. In 1949 the mill operated at one-half to two-thirds capacity, except during July and the first week in August, when it was closed by a work stoppage. The mill equipment includes differential-density (sink-and-float) preliminary-concentration units, which furnish an enriched product for treatment by jigging and flotation. The mill feed in 1949 totaled 2,550,638 tons, of which 68 percent came from Oklahoma. Eagle-Picher mines in Oklahoma shipping to the mill were the Big Chief, Blue Goose mines, Buffalo, Crawfish, Goodeagle No. 3, Goodwin, Gordon No. 2, Grace Walker No. 2, Hum-bah-wat-tah mines, John Beaver No. 2, Kenoyer mines, Lottson No. 2, Netta No. 2, Piokee, Royal, See Sah, Slim Jim-Bankard, Swift, Vantage, Wesa, White, and Wilson.

The leading Oklahoma custom shippers to the Central mill (in order of tonnage) were the Federal Mining & Smelting Co. (Gordon, Lucky Syndicate-Howe-Ohimo mines), and the W. M. & W. (Velie Nos. 1 and 2, Little Greenback), Frank Hudson (Craig, Bingham), F. W. Evans (Shorthorn), Tom Kiser (Wesa Greenback, Little Greenback), Jake Dryer (Southside), C. G. & C. (Lucky Bill), Mahutska (Jeff City No. 2, Eudora), Little Bill, Tongaha (Tongaha-Anna Beaver), Carpenter (New York, Oko), Cardinal, and Hunt (Dorothy Bill) mining companies. Additional substantial shippers to the Central mill or other custom mills included the Golden Hawk mine, Brewster-Federal (M. & W.), Blackhawk, Baird-Tar Creek, DeVilliers (Nancy Jane), Crystal, Mary Whitebird (A. & A.), Discard, Dobson, Bonanza, Crutchfield, Bob White, and Aztec.

The Nellie B. Mining Co. operated its Rialto, Lawyers, and Barbara J. mines and mills throughout 1949. The three mills together have a capacity of 2,500 tons daily. Production rates were lower after metal prices began to decline in March. The Harris Mining Co. operated the Farmington mine and Lucky Jenny mill continuously.

The C. & M. Mining Co. operated its No. 4 (Imbeau) mine and mill throughout the year. The Scott mill and the Scott and Mary Ann mines were in production about 9 months. The United Zinc Smelting Corp. Royal mill (treating company and custom ore) operated during the first part of the year. The Federal Quapaw-Davenport mine, operated from January 1 to June 14, was the principal custom shipper to the Royal mill. The Mission mill ran on custom ore throughout the year; the Dewey Sims Pelican mine was the largest shipper to the mill. The Park Walton mine and mill closed February 1.

The Sooner Mining Co. operated its tailing mill throughout 1949. The Big Chief, Cardin (Western), and Britt & Britt tailing mills operated from 2 to 4 months during the first half of the year. The Eagle-Picher Bird Dog mill operated on slimes.

KANSAS

The Kansas zinc-lead mining areas are in the southeastern corner of the State and comprise part of the Tri-State district. General details of the Tri-State mining industry are given in a foregoing section. Mines in Kansas produced 37 percent of the Tri-State total output of zinc in 1949 and 42 percent in 1948. A 17-percent decrease from 1948 in the Kansas output accounted for most of the 7-percent decline in the total Tri-State output of zinc. Lead production in Kansas in 1949 increased 17 percent over 1948 and was the largest since 1941.

Mine production of lead and zinc in Kansas, 1945–49, and total, 1876–1949

Year	Mines producing	Lead concentrates		Zinc concentrates		Metal content [1]			
						Lead		Zinc	
		Short tons	Value	Short tons	Value	Short tons	Value	Short tons	Value
1945	82	9,967	$1,236,322	89,305	$9,715,271	7,370	$1,267,640	48,394	$11,130,620
1946	82	8,499	1,388,210	87,963	9,902,906	6,445	1,405,010	47,703	11,639,532
1947	79	9,600	1,811,269	76,699	7,641,709	7,285	2,098,080	41,497	10,042,274
1948	79	11,090	2,592,500	66,340	5,833,441	8,386	3,002,188	35,577	9,463,482
1949	70	12,973	2,463,056	54,969	4,262,380	9,772	3,087,952	29,433	7,299,384
1876–1949	------	771,885	60,657,148	5,115,421	230,477,919	589,010	72,825,009	2,653,971	360,218,048

[1] In calculating metal content of the ores from assays allowance has been made for smelting losses of both lead and zinc. In comparing the values of ore and metal it should be borne in mind that the value given for the ore is that actually received by the producer, whereas the value of the lead and zinc is calculated from the average price for all grades.

The Baxter Springs-Blue Mound-Treece area has produced most of the Kansas output of zinc and lead since 1918; in 1949 this area contributed 95 percent of the total State output of zinc concentrates and 92 percent of the lead concentrates. About 59 percent of the crude ore mined in the area was concentrated in the Central mill of the Eagle-Picher Mining & Smelting Co. at Cardin, Okla. Most of the ore was transported to the mill over the Northeast Oklahoma Railroad, which has spur tracks to the principal ore-hoisting shafts. Producing Eagle-Picher mines in this area were the Big John, Foley No. 3, Mullen, Webber, Westside No. 2, and Wilbur.

Tenor of lead and zinc ore and old tailings milled and concentrates produced in Kansas, 1948–49

	1948		1949	
	Crude ore	Old tailings	Crude ore	Old tailings
Total ore and old tailings milled short tons	1,788,298	471,498	1,602,976	544,034
Total concentrates produced:				
Galena do	11,090		12,951	22
Sphalerite do	63,697	2,643	52,245	2,724
Ratio of concentrates to ore, etc.:				
Lead percent	0.62		0.81	0.004
Zinc do	3.56	0.56	3.26	.50
Metal content of ore, etc.:[1]				
Lead do	.48		.62	.002
Zinc do	2.12	.33	1.94	.29
Average lead content of galena concentrates do	77.16		76.87	57.58
Average zinc content of sphalerite concentrates do	59.56	59.60	59.59	57.64
Average value per ton:				
Galena concentrates	$233.77		$190.02	$95.55
Sphalerite concentrates	$87.64	$94.89	$78.08	$67.21

[1] Figures represent metal content of the crude ore (or "dirt") only insofar as it is recovered in the concentrates; data on tailing losses not available.

The Walter Hartley mine of the National Lead Co., St. Louis Smelting & Refining Division near Baxter Springs, was again the largest individual mine producer of zinc in Kansas and the Tri-State district. Highly selective mining, which will result in a shorter life for the mine, was necessary after the sharp decline in the price of zinc. The ore from this mine and other company mines (Ballard, Moore, and Shanks) was treated in the company No. 8 (Ballard) central mill. The mill also treated custom ore from the Bailey, Bonanza, and Liza Jane mines.

The Dines Mining Co. operated its mill and the Hartley No. 1 and Stoskopf mines most of the year. Besides company ore, the mill treated custom ore from the C. K. & E. (Stebbins, Karcher), and Roanoke (Homestake) mines. The Beck Mining Co. No. 3 mill operated about 10 months, mostly on ore from the company Swalley mine, the MacArthur mines, and the Contact mine; smaller tonnages were received from the Ninety-Six, Brewster No. 6, and Jones mines. The Fox Mining Co. reopened the Robinson (formerly Youngman) mill and the Robinson mine and operated them from February 1 to June 15. The Wade-Rea mill ran all the year, treating company and custom ore. The M. & W. mill treated custom ore from the Liza Jane, F. & G. (Lindsay-State Line), Brewster-Federal, Athletic, High Five (Murphy, at Galena), and 10 other small producers.

The Bilharz Mining Co. Muncie mine was among the larger shippers of custom ore to the Eagle-Picher Central mill. Other shippers included the Ebenstein, Grace Jarrett (Wright), Mark Twain (Blue Mound-Blue Diamond, Naylor), Robinson (Douthit, Jarrett), Bob White (Chubb, Cherokee, Kansouri), A. & H. (Bendelari), Linda Lou (Northern), and Race Track. The Harris Mining Co. operated the Golden Rod mine. The Captain tailing mill operated 3 months. Old tailings from Kansas were treated in the Sooner mill in Oklahoma. The Barr Cleanup (Lucky Seven) mill ran 5 months. In June the Lavrion Mining Co. ceased work on unwatering and developing the

Garrett property, begun in 1948. The Bureau of Mines began work on an exploratory drilling project in the Melrose area November 2 and completed it March 18, 1950.

In the Crestline and Waco (Kansas part) areas F. W. Evans operated the Crutchfield and American mines at Crestline and his mill at Waco from January through March. Glen Richey operated the Grasselli mine at Waco part of the year.

Mines at Galena shipped ore to custom mills in other areas. The principal producer, the Murphy open-pit mine of Childress-Murphy Mines, Inc., was closed May 7. Other producers included the L. & S. (Cooper Hollow, Cornwall) mines; the Rummery, Turner-Rosenberry (Childress), and Alexander leases; and many small-scale individual lead-mining operations. The Eagle-Picher lead smelter and lead- and zinc-pigment plant at Galena purchases most of the lead concentrates produced in the Tri-State district.

ARKANSAS

The only activity in lead and zinc mining reported in Arkansas in 1949 was in the Ponca district, Newton County. Ore shipped totaled 6 tons containing 1 ton of recoverable zinc and 1 ton of lead. The ore comprised 1 lot each of zinc ore and lead ore from the Primrose mine, and 1 lot of zinc ore from the Brewer. In 1948 the State output was 31 tons of recoverable zinc and 22 tons of lead.

Montana

Gold, Silver, Copper, Lead, and Zinc

(MINE REPORT)

By C. E. Needham and Paul Luff

GENERAL SUMMARY

NONE of the five major nonferrous metals in Montana in 1949 equaled the yield in 1948. Gold output declined 28, silver 9, copper 3, lead 2, and zinc 8 percent. Ore production was 14 percent less than in 1948. As a result of reductions in base-metal prices, as well as in the output of all five metals, the value of each metal was considerably less than in 1948—gold 28 percent less, silver 9, copper 12, lead 14, and zinc 14. This resulted in an over-all drop of 13 percent in total value—from $56,422,609 in 1948 to $49,003,447 in 1949. Of the total value in 1949, copper contributed 46 percent, zinc 27, lead 12, silver 11, and gold 4.

All tonnage figures are short tons and "dry weight"; that is, they do not include moisture.

The value of the metal production reported herein has been calculated at the following prices.

Prices of gold, silver, copper, lead, and zinc, 1945–49

Year	Gold [1] (per fine ounce)	Silver [2] (per fine ounce)	Copper [3] (per pound)	Lead [3] (per pound)	Zinc [3] (per pound)
1945	$35.00	$0.711+	$0.135	$0.086	$0.115
1946	35.00	.808	.162	.109	.122
1947	35.00	.905	.210	.144	.121
1948	35.00	.905+	.217	.179	.133
1949	35.00	.905+	.197	.158	.124

[1] Price under authority of Gold Reserve Act of Jan. 31, 1934. Treasury legal coinage value of gold from Jan. 18, 1837, to Jan. 31, 1934, was $20.67+ ($20.671835) per fine ounce.
[2] Treasury buying price for newly mined silver. 1945 to June 30, 1946: $0.71111111; July 1, 1946, to Dec. 31, 1947: $0.905; 1948–49: $0.9050505.
[3] Yearly average weighted price of all grades of primary metal sold by producers. Price in 1945–47 includes bonus payments by Office of Metals Reserve for overquota production.

Mine production of gold, silver, copper, lead, and zinc in Montana in 1945–49 and total, 1862–1949, in terms of recoverable metals

Year	Mines producing		Ore (short tons)	Gold (lode and placer)		Silver (lode and placer)	
	Lode	Placer		Fine ounces	Value	Fine ounces	Value
1945	160	26	4,919,562	44,597	$1,560,895	5,942,070	$4,225,472

1947	54	6,093,609	27,434	960,190	.158
1948	34	4,293,611	16,541	578,935	.135
1949	48	3,023,372	9,821	343,735	.114

[1] First year for which this method was reported used in Montana.

[2] Includes all placer operations using power excavator and washing plant, both on dry land; an outfit with movable washing plant is termed a "dry-land dredge."

Mine production of gold, silver, copper, lead, and zinc in Montana in 1949, by months, in terms of recoverable metals

Month	Gold (fine ounces)	Silver (fine ounces)	Copper (short tons)	Lead (short tons)	Zinc (short tons)
January	3,315	606,695	4,600	1,665	5,710
February	3,380	568,345	5,495	1,741	5,520
March	4,445	646,135	5,750	1,905	6,195
April	4,615	620,075	5,210	1,545	5,255
May	5,055	659,495	5,175	1,530	5,725
June	4,525	453,785	4,230	1,460	4,245
July	4,680	419,455	3,960	1,310	3,660
August	4,270	469,815	4,035	1,390	3,725
September	4,110	361,090	3,790	1,135	2,685
October	4,145	424,680	4,335	1,355	3,175
November	4,344	490,020	4,761	1,305	3,710
December	5,840	607,435	5,270	1,655	4,590
Total: 1949	52,724	6,327,025	56,611	17,996	54,195
1948	73,091	6,930,716	58,252	18,411	59,095

Gold.—Gold output in Montana in 1949 decreased from both lodes and placers. Among the larger gold-producing properties, only the Estelle-New Year's Gift group and the Cornucopia mine reported larger gold yields in 1949 than in 1948. Declines were pronounced at the Butte operations of the Anaconda Copper Mining Co., Drumlummon, Ruby, U. S. Grant, and Golden Sunlight mines, H. & H. Mines dredge, and Porter Bros. dredge. Of the State gold in 1949, 49 percent was derived from gold and silver ores (40 percent in 1948), 32 percent from base-metal ores (37 percent in 1948), and 19 percent from placers (23 percent in 1948). Ores milled yielded 60 percent of the total gold, and ores shipped to smelters nearly 22 percent.

Gold producers in Montana, each with an output of 1,800 ounces or more in 1949, were the properties of the Anaconda Copper Mining Co. (copper ore and waste materials and zinc-lead ore and dumps) at Butte, Estelle-New Year's Gift group (gold ore) in Park County, Porter Bros. (dredge) at Helena, Drumlummon mine (gold ore) at Marysville, Cornucopia mine (gold-silver ore) near Virginia City, Ruby mine (gold ore) in Phillips County, H. & H. Mines (dredge) in Granite County, and Golden Sunlight mine (gold ore) near Whitehall. From these eight properties came 77 percent of the total gold in 1949.

Silver.—Output of silver at the Butte Hill mine and dumps of the Anaconda Copper Mining Co. was 7 percent lower in 1949 than in 1948. Yield of the metal was slightly greater from copper ore but considerably less from zinc-lead ore. The property contributed 83 percent of the State total silver in 1949, followed by the Emma mine at Butte and the Mike Horse mine at Flesher. These three furnished 89 percent of the total silver.

Zinc-lead ore supplied 62 percent of the State silver in 1949, copper ore 29, gold and silver ore 7, and lead and zinc ores together 2 percent. Ores milled yielded 91 percent of the total silver, and smelting ores almost 9 percent; minor sources were placers and old zinc slag fumed.

Copper.—Yield of copper in 1949 increased from zinc-lead ore but declined from copper ore produced at the Butte Hill mine and dumps

of the Anaconda Copper Mining Co. Reduced output from the copper ore resulted mainly from curtailment of operations following sharp breaks in the price of copper beginning in March. The company contributed over 98 percent of the State copper in 1949.

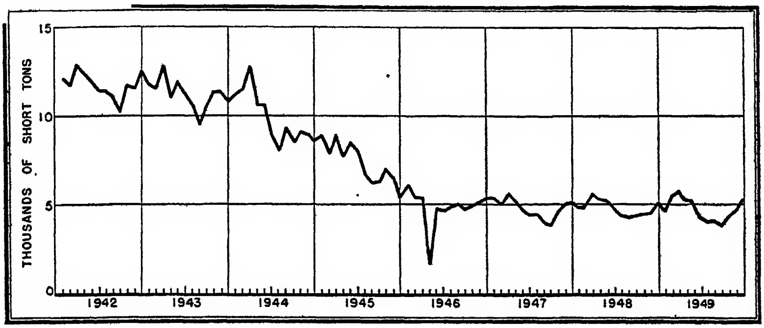

FIGURE 2.—Mine production of copper in Montana, 1942–49, by months, in terms of recoverable metal.

Lead.—The leading factor in the decline of lead output in Montana in 1949 was the 17-percent decrease in production of the metal from zinc-lead ore produced by the Anaconda Copper Mining Co. from its Butte Hill mine and dumps. Output of lead also declined from the Emma mine, but the Mike Horse and Jack Waite mines reported substantial increases. However, the Mike Horse mine closed in December, owing to low prices of lead and zinc. The Anaconda Copper Mining Co. produced 45 percent of the State lead in 1949; other operations that produced more than 2 million pounds of recoverable lead each were the Emma, Mike Horse, and Jack Waite mines. These four furnished 79 percent of the total lead. Of the total lead, 84 percent was recovered from zinc-lead ore, 10 percent from lead ore, 3 percent from gold and silver ores, and 3 percent from zinc ore and old slag.

Zinc.—Zinc production in 1949 declined 8 percent at the Butte Hill mine and dumps; decreases were particularly marked from June through September, following marked drops in the price of the metal. Declines were also reported from the Emma mine and the old slag pile at East Helena, but large gains were made at the Mike Horse and Travona mines. Leading State zinc producers in 1949, each with an output of more than a million pounds of recoverable zinc, were the Butte Hill mine and dumps (72 percent of the State total), Emma and Mike Horse mines, East Helena old slag dump, an old slag dump in Cascade County, and the Travona mine, which together furnished 97 percent of the total. Of Montana zinc in 1949, 93 percent was derived from zinc-lead ore, 5 percent from zinc ore and old slag, and nearly all the remainder from gold and silver ores and lead ore.

MINE PRODUCTION BY COUNTIES

Mine production of gold, silver, copper, lead, and zinc in Montana in 1949, by counties, in terms of recoverable metals

County	Mines producing		Gold (lode and placer)		Silver (lode and placer)	
	Lode	Placer	Fine ounces	Value	Fine ounces	Value
Beaverhead	31	3	1,537	$53,795	59,316	$53,684

MINING INDUSTRY

Active lode mines in Montana increased 12 percent from 250 in 1948 to 281 in 1949; active placer mines increased 41 percent in number, even though the output of placer gold decreased 41 percent from that in 1948. Declining base-metal prices during the spring and summer resulted in the closing of a number of small properties and a few of the larger; however, the main effect was one of curtailment. At the Butte properties of the Anaconda Copper Mining Co. a 5-day work week went into effect early in June, underground mining was reduced,

shipments of zinc-lead dump ore ceased, and work on the Greater Butte project was temporarily suspended. But at mid-November, copper mining at the Belmont mine, shipping of zinc-lead dump ore, and sinking of the Kelly shaft were resumed. Of particular note over the State was the shift during the year of operators from small properties producing base-metal ores to those producing gold and silver ores, as base-metal mining became less profitable.

Copper ore mined in the State in 1949 declined 19 percent, zinc-lead, zinc, and lead ores 7, and gold and silver ores 22. Of the 2,595,934 tons of ore treated during the year (3,020,307 in 1948), 47 percent was copper ore (50 percent in 1948), 46 percent was zinc-lead, zinc, and lead ores (43 percent in 1948), and 7 percent was gold and silver ores (7 percent in 1948).

ORE CLASSIFICATION

Details of ore classification are given in the Gold and Silver chapter of this volume.

Ore sold or treated in Montana in 1949, with content in terms of recoverable metals

Source	Mines producing	Ore (short tons)	Gold (fine ounces)	Silver (fine ounces)	Copper (pounds)	Lead (pounds)	Zinc (pounds)
Dry gold ore	88	116,299	21,263	68,471	844,843	84,458	17,577
Dry gold-silver ore	33	15,801	3,624	107,075	9,398	178,124	173,929
Dry silver ore	52	37,190	1,147	259,378	75,416	669,932	803,421
Total	173	169,290	26,034	434,924	929,657	932,514	994,927
Copper ore	11	1,231,266	5,027	1,845,783	[1] 105,708,559		
Lead ore	87	21,248	1,312	93,039	38,062	3,746,277	317,721
Lead-copper ore	1	3		171	165	1,051	
Zinc ore	2	[2] 34,100	99	55,393	104,213	1,213,387	5,889,208
Zinc-lead ore	46	1,140,027	10,431	3,896,726	6,441,344	30,098,771	101,188,144
Total lode mines	[3] 281	2,595,934	42,903	6,326,036	[1] 113,222,000	35,992,000	108,390,000
Placers	48		9,821	989			
Total: 1949	329	2,595,934	52,724	6,327,025	[1] 113,222,000	35,992,000	108,390,000
1948	284	3,020,307	73,091	6,930,716	[4] 116,504,000	36,822,000	118,190,000

[1] Includes 4,419,019 pounds recovered from precipitates.
[2] Includes 14,585 tons of zinc slag fumed.
[3] A mine producing more than 1 class of ore is counted but once in arriving at total for all classes.
[4] Includes 5,503,688 pounds recovered from precipitates.

METALLURGIC INDUSTRY

The 2,595,934 tons of ore produced from Montana lode mines in 1949 were treated as follows: 2,464,870 tons (95 percent) at mills (2,893,171 tons in 1948); 116,479 tons (4 percent) shipped to smelters (104,409 tons in 1948); and 14,585 tons (0.56 percent) of old lead-smelter slag fumed (22,727 tons in 1948).

The 12,320-ton copper concentrator and the 2,000-ton zinc concentrator of the Anaconda Copper Mining Co. at Anaconda operated continuously in 1949. The company copper smelter (annual capacity, 1,300,000 tons of charge) and the two electrolytic-zinc plants at Anaconda and Great Falls (combined capacity 233,400 tons of slab zinc per year) also were operated throughout the year. The zinc plants treated 533,964 tons of zinc concentrates from many sources

containing 563,625,671 pounds of zinc, compared with 511,119 tons containing 543,164,009 pounds of zinc in 1948. The company slag-fuming plant at East Helena was operated all year and treated 222,875 tons of hot slag and old cold slag compared with 221,754 tons in 1948; output of zinc-lead fume increased from 35,781 tons in 1948 to 36,827 tons in 1949; nearly all of it was treated at the Great Falls electrolytic zinc plant.

The lead smelter of the American Smelting & Refining Co. at East Helena operated throughout 1949 and treated chiefly lead-silver concentrates from Idaho, residues from the electrolytic zinc plants at Anaconda and Great Falls, and crude ores, concentrates, and old tailings from various districts in Montana.

Mine production of metals in Montana in 1949, by methods of recovery, in terms of recoverable metals

Method of recovery	Gold (fine ounces)	Silver (fine ounces)	Copper (pounds)	Lead (pounds)	Zinc (pounds)
Ore amalgamated	4,284	2,581			
Ore cyanided	2,524	11,449			
Concentrates smelted [1]	24,613	5,763,802	106,298,126	30,312,039	101,306,995
Copper precipitates smelted			4,419,019		
Ore smelted	11,478	542,345	2,502,695	5,359,766	4,158,877
Old slag fumed	4	5,859	2,160	320,195	2,924,128
Placer	9,821	989			
Total: 1949	52,724	6,327,025	113,222,000	35,992,000	108,390,000
1948	73,091	6,930,716	116,504,000	36,822,000	118,190,000

[1] Includes zinc concentrates treated at electrolytic plants.

Gross metal content of Montana ore treated at mills in 1949, by classes of ore [1]

Class of ore	Ore (short tons)	Gross metal content of mill feed				
		Gold (fine ounces)	Silver (fine ounces)	Copper (pounds)	Lead (pounds)	Zinc (pounds)
Dry gold	105,564	20,453	100,465	1,246,060	23,750	11,615
Dry gold-silver	1,601	79	1,600	600	19,600	13,400
Dry silver	2,260	205	25,080	21,285	40,000	26,750
Copper	1,204,471	5,403	1,911,575	105,441,510		
Lead	10,224	8	1,657	3,000	627,000	12,700
Zinc	2,483	25	13,417	53,093	42,070	422,108
Zinc-lead	1,138,267	15,023	4,806,535	8,219,990	35,879,591	118,262,140
Total: 1949	2,464,870	41,196	6,860,329	114,985,538	36,632,011	118,748,713
1948	3,893,171	57,157	7,751,577	120,458,183	40,987,047	127,270,191

[1] Exclusive of copper ore by leaching.

Mine production of metals from mills in Montana in 1949, by counties, and by classes of concentrates smelted, in terms of recoverable metals

REVIEW BY COUNTIES AND DISTRICTS

BEAVERHEAD COUNTY

Argenta District.—Ida B. Hand, owner, and lessees operated the Louis Phillip (Maulden) mine throughout the year and shipped to smelters 3,111 tons of lead ore containing 239 ounces of gold, 16,117 ounces of silver, 18,337 pounds of copper, 809,978 pounds of lead, and 110,870 pounds of zinc. Olamont Mining Co. worked the Ermont mine and treated 3,168 tons of gold ore by cyanidation. The Shafer group of claims was worked by Shafer Bros. and lessees; 664 tons of gold ore were shipped to smelters. George Fleming operated the Sylvia mine all year and shipped 202 tons of lead smelting ore containing 279 ounces of gold, 9,264 ounces of silver, 637 pounds of copper, 124,206 pounds of lead, and 4,800 pounds of zinc. Remaining district output was principally lead ore from a number of small properties.

Bryant District.—Output from the Hecla property comprised 434 tons of old silver slag, 84 tons of gold-silver ore, and 6 tons of zinc-lead ore.

Chinatown District.—Lessees operated the H & S mine part of the summer and shipped 235 tons of lead smelting ore containing 10 ounces of gold, 3,065 ounces of silver, 459 pounds of copper, 166,162 pounds of lead, and 10,000 pounds of zinc.

Mine production of gold, silver, copper, lead, and zinc in Montana in 1949, by counties and districts, in terms of recoverable metals

Horse Prairie Creek (Colorado) District.—District production was from two placers operated by nonfloating washing plants and dragline excavators—W. C. McLeod washed 50,000 cubic yards of gravel from the Golden Leaf placer, and Charles Brenner washed 1,000 cubic yards of gravel from his property on Colorado Creek.

Vipond District.—Quartz Hill Development Co. operated its mine until June 1, when the company was dissolved; during the year the mine produced 918 tons of silver smelting ore. Remaining district production was also silver ore—234 tons from the Monte Cristo mine and 32 tons from the Silver Fawn claim.

BROADWATER COUNTY

Backer District.—All district output came from gold ore and placers, most of which was produced by A. R. Douglas, who operated a nonfloating washing plant and dragline excavator on gravels in Confederate Gulch.

Beaver District.—H. W. Carver operated the East Pacific group all year and produced 1,376 tons of gold-silver ore, which was treated in a 50-ton gravity mill on the property; in addition, 17 tons of zinc-lead ore were shipped to a smelter. Other district production was mainly 431 tons of zinc-lead ore and 106 tons of lead ore from the Kleinschmidt group, operated during the first half of the year by the Linn Mining Co. and the second half by H. W. Carver.

Cedar Plains District.—Principal output was 97 tons of lead smelting ore produced by John Luth, lessee, from the Joe Dandy claim, 116 tons of gold smelting ore from the Nada mine, 136 tons of zinc smelting ore from the Ruby Silver mine, and 405 tons of silver smelting ore from the Spar mine.

Park or Indian Creek District.—Bayles & Mosier operated the Iron Mask mine until June 10 and treated 1,400 tons of zinc-lead ore in the 50-ton flotation mill on the property. Dance & Anders, lessees, operated the Marietta mine all year and shipped 429 tons of gold smelting ore containing 658 ounces of gold, 1,671 ounces of silver, 370 pounds of copper, 13,452 pounds of lead, and 7,916 pounds of zinc. William Zimmerman worked the Silver Wave claim from October 15 to the end of the year and treated 147 tons of gold ore by table concentration.

CASCADE COUNTY

Montana District.—The Bennett Mining Co. worked the Dacotah group until the end of May, then closed for the remainder of the year because of declining metal prices. During the period of its operation, the mine produced 5,328 tons of zinc-lead ore, which was treated in the company 75-ton flotation mill. Kings Hill Mining Co. operated the Broadwater group during the first half of the year and produced 5,866 tons of zinc-lead ore which yielded 63 tons of lead concentrate and 139 tons of zinc concentrate. Lewis B. Stark, lessee, operated the Galt and Star groups and produced zinc-lead ore which yielded 203 tons of lead concentrate and 138 tons of zinc concentrate. Remaining district output was mainly 215 tons of zinc-lead milling ore from the Silver Dyke group.

Smelter District.—Metal production credited to the Smelter district in 1949 came from 16,808 tons of old smelter slag.

DEER LODGE COUNTY

Georgetown District.—District output was all gold ore—397 tons from the Pyrenees mine and 360 tons from the Gold Coin mine.

GRANITE COUNTY

Boulder and South Boulder District.—Silver ore comprised the bulk of lode production in 1949—about 500 tons from the Brooklyn group, 138 tons from Non-Pareil claim, and 176 tons from the Moonlight (Annie) group. Mining Ventures Corp. operated the Montana-Tonopah placer with a nonfloating washing plant and dragline excavator from May 1 to September 20 and recovered 32 ounces of gold from 3,000 cubic yards of gravel.

Flint Creek District.—Principal district output was made by the American Machine & Metals, Inc., from the Trout group. Production was 96 tons of lead smelting ore containing 1 ounce of gold, 3,545 ounces of silver, 16,323 pounds of lead, and 11,306 pounds of zinc; and 581 tons of silver smelting ore containing 8 ounces of gold and 10,104 ounces of silver.

Gold Creek and South Gold Creek District.—The Master Mining Co. did placer mining on upper Gold Creek and washed about 25,000 cubic yards of gravel.

Henderson District.—H. & H. Mines operated its bucket-line dredge on Henderson Creek from April 15 to December 19 and recovered 1,931 ounces of gold, 124 ounces of silver, and some tungsten concentrate from washing 700,000 cubic yards of gravel.

JEFFERSON COUNTY

Colorado District.—Main district production comprised 5,817 tons of old silver tailings from the Alta dump, 619 tons of gold-silver ore from the Blizzard dump and Margaret Ann claim, 132 tons of similar material from the Minah dump, and 1,010 tons of lead ore and 308 tons of gold-silver ore from the Mount Washington mine and dump.

Elkhorn District.—Output for the year comprised 1,630 tons of silver ore from the Elkhorn mine, 3,158 tons of old silver tailings from the Elkhorn dump, and 624 tons of lead ore, and 239 tons of gold-silver ore from the Elkhorn Queen mine.

Golconda District.—The Golconda Mining Co. operated the Buckeye (Gold Coin) group and treated 5,200 tons of gold ore in the company 80-ton cyanide plant.

Whitehall District.—Theodore Davenport operated the Perhaps mine and shipped 239 tons of lead smelting ore containing 11 ounces of gold, 466 ounces of silver, 633 pounds of copper, 31,050 pounds of lead, and 11,968 pounds of zinc. Weber & Westfall worked the Minerva mine from January to July and shipped 174 tons of lead smelting ore containing 10 ounces of gold, 514 ounces of silver, 471 pounds of copper, 45,247 pounds of lead, and 6,049 pounds of zinc. Marvin Riebhoff shipped 6,143 tons of gold ore from the Golden Sunlight mine and 129 tons of similar ore from the Blue Moose claim. Remaining district production was principally 521 tons of lead smelting ore from the Carbonate mine, 430 tons of similar ore from the Whitehall mine, and 69 tons of gold-silver ore and 80 tons of lead ore from the Parrott mine.

JUDITH BASIN COUNTY

Barker District.—Thorson & Brazee worked the Wright-Edwards (Block P) group all year and shipped 144 tons of zinc-lead smelting ore containing 4 ounces of gold, 3,665 ounces of silver, 720 pounds of copper, 72,992 pounds of lead, and 49,632 pounds of zinc.

LEWIS AND CLARK COUNTY

Heddleston District.—The Mike Horse Mining & Milling Co. operated the Mike Horse mine until December, then closed it because of low prices for lead and zinc. The company 300-ton flotation mill treated 57,710 tons of zinc-lead ore during the year containing 100 ounces of gold, 121,382 ounces of silver, 394,800 pounds of copper, 5,076,000 pounds of lead, and 4,649,200 pounds of zinc.

Helena District.—Porter Bros. operated its 6-cubic-foot bucket-line dredge in Last Chance Gulch throughout 1949 and washed 1,904,905 cubic yards of gravel. Remaining district production was mainly 910 tons of old gold-silver tailings from the Peck Concentrator dump.

Lincoln District.—Otis Williams & Co. operated a dragline dredge and nonfloating washing plant on Poorman and McClellan Creeks and washed about 250,000 cubic yards of gravel.

Marysville District.—The Montana Rainbow Mining Co. operated the Drumlummon mine and 150-ton amalgamation-flotation mill throughout the year; 10,554 tons of gold ore were treated by amalgamation in riffle boxes, followed by flotation. J. R. Reynolds and Ruth Haley operated the Shakopee mine and shipped 1,021 tons of zinc-lead smelting ore.

Rimini District.—Principal production was 413 tons of gold-silver dump ore from the Lexington group and 913 tons of lead ore and 231 tons of gold-silver ore from the Evergreen group.

Scratch Gravel District.—District output was largely 122 tons of lead smelting ore from the Franklin mine and 112 tons of gold ore from the Herb W. claim.

Smelter District.—All but a small part of the metals credited to the Smelter district came from 14,585 tons of old zinc slag treated at the East Helena slag-fuming plant of the Anaconda Copper Mining Co. and the lead blast furnace of the American Smelting & Refining Co.

Stemple-Gould District.—Swansea Mines, Inc., operated the New Silver Bell mine and produced silver ore that yielded 127 tons of lead-copper concentrate. Operations ceased in September because the 120-ton flotation mill was destroyed by fire.

MADISON COUNTY

McCarthy Mountains District.—C. O. Dale & Sons, lessees, worked the Polly Jane mine and shipped 339 tons of lead ore containing 3 ounces of gold, 3,196 ounces of silver, 1,149 pounds of copper, 161,168 pounds of lead, and 670 pounds of zinc.

Rochester District.—Jacobson & Keene, lessees, worked the Calvin mine and shipped 108 tons of lead ore containing 7 ounces of gold, 739 ounces of silver, 217 pounds of copper, 26,890 pounds of lead, and 6,008 pounds of zinc. Lessees operated the Emma group part of the year and shipped ore mostly from the dumps and tailing piles. Of the 1,244 tons shipped, 1,158 tons of gold-silver material and 6 tons

of lead ore went to smelters, and 80 tons of lead dump ore were treated by table concentration. Lessees worked the Thistle mine and produced 248 tons of gold ore.

Sheridan District.—R. J. & A. E. Shute worked the Silver Bar (Octopus) mine and shipped 840 tons of silver smelting ore. Remaining district production was principally gold ore, of which 273 tons came from the property of the Hunt Mining Co. and 177 tons from the Latest Out claim. Considerable gold was recovered from the Ihde placer.

Silver Star District.—Bulk of production was 25,878 tons of gold milling ore from the American Pit (Victoria) mine, which made 2,430 tons of copper concentrate.

Tidal Wave District.—Output was nearly all gold ore—61 tons from the Corncracker group and 46 tons from the High Ridge and High Ridge Fraction group.

Virginia City District.—The bulk of district production was gold-silver ore—2,071 tons from the U. S. Grant mine, 218 tons from the El Fleeda mine, and 162 tons from the Easton-Pacific group (all three operated by the U. S. Grant Mining Co.), and 6,714 tons from the Cornucopia mine, operated by H. A. Shute.

MEAGHER COUNTY

Beaver, Elk, and Thomas Creeks District.—Walter Walsh did hydraulicking on Elk Creek from June to October and recovered 30 ounces of gold from washing 500 cubic yards of gravel.

MINERAL COUNTY

Iron Mountain (Superior) District.—E. G. Smith, lessee, worked the dumps of the Iron Mountain mine from September 1 to November 15 and hauled 5,110 tons of zinc-lead ore to the Nancy Lee mill for treatment.

Keystone District.—E. G. Smith also worked the Nancy Lee group under lease and treated 5,500 tons of zinc-lead ore in his 100-ton flotation mill.

MISSOULA COUNTY

Copper Cliff (Cramer Creek) District.—Linton Mines operated the Blacktail open-pit mine in 1949 and built a 500-ton sink-float plant on the property, reported to be the first of its kind in the State. The mill was operated from August through November and treated 10,000 tons of lead ore which yielded 576 tons of lead concentrate.

PARK COUNTY

New World District.—McLaren Gold Mines Co. operated its open-pit Estelle-New Year's Gift group all year and treated 39,139 tons of gold ore in the company 150-ton concentration mill. Parkmont Corp. operated the Homestake mine in 1949; production was mainly gold ore treated by amalgamation and concentration, although small lots of copper ore and lead ore were shipped to smelters. Irma Mines, Inc., milled zinc-lead ore from the Irma mine; the mill yielded 54 tons of lead concentrate and 83 tons of zinc concentrate. In addition, 33 tons of zinc-lead ore, 186 tons of lead dump ore and slag, and 25 tons of silver ore were shipped from the property to a smelter.

PHILLIPS COUNTY

Little Rockies District.—The Ruby Gulch Mining Co. operated the Ruby group from May to December and treated 14,875 tons of gold ore in the company 300-ton cyanide leaching plant. In addition, 78 tons of similar ore were shipped to a smelter.

POWELL COUNTY

Nigger Hill District.—Hopkins & Sons Mining Co. operated the Charter Oak mine throughout the year and shipped 695 tons of lead smelting ore containing 77 ounces of gold, 5,858 ounces of silver, 2,945 pounds of copper, 128,046 pounds of lead, and 22,640 pounds of zinc. In addition, 225 tons of gold-silver ore were treated in the company 40-ton flotation mill. Newman Bros. operated the Lilly-Orphan Boy group all year and shipped 50 tons of gold ore, 85 tons of gold-silver ore, and 38 tons of zinc-lead ore. Silica Products Co., Inc., operated the Negros mine and shipped 233 tons of gold smelting ore.

Zozell District.—Principal district production was 518 tons of gold smelting ore from the Bonanza group. The property was operated by the Bonanza Leasing Co. and Western Mining Projects.

RAVALLI COUNTY

Curlew District.—B. F. Tout operated the Curlew mine and treated zinc-lead milling ore, which made 42 tons of lead concentrate and 107 tons of zinc concentrate.

Overwich (Hughes Creek) District.—Clarence Hogue operated a placer and recovered 109 ounces of gold and 10 ounces of silver.

SANDERS COUNTY

Eagle District.—The American Smelting & Refining Co. operated the Jack Waite mine throughout 1949 and produced 5,314 tons of zinc-lead milling ore and 429 tons of lead smelting ore. The milling ore contained 19 ounces of gold, 6,942 ounces of silver, 14,000 pounds of copper, 1,562,800 pounds of lead, and 317,800 pounds of zinc.

Revais Creek District.—The Green Mountain Mining Co. operated the Drake group intermittently until September 1, then closed because of economic conditions. Production was 115 tons of copper ore containing 10 ounces of gold, 123 ounces of silver, and 20,207 pounds of copper.

SILVER BOW COUNTY

Ore production in Silver Bow County in 1949 was 13 percent less than in 1948; output of gold declined 18 percent, silver 8, copper 3, lead 13, and zinc 9. The total value of the five metals was nearly 14 percent below that in 1948 and represented 88 percent of the State total value. The following table gives the output of mines in the county, which includes the Summit Valley (Butte) district, in 1948–49 and the total from 1882 to the end of 1949.

Production of gold, silver, copper, lead, and zinc in Silver Bow County, Mont., 1948–49, and total, 1882–1949, in terms of recoverable metals

Year	Mines producing	Ore (short tons)	Gold (lode and placer, fine ounces)	Silver (lode and placer, fine ounces)	Copper (pounds)	Lead (pounds)	Zinc (pounds)	Total value
1948	22	2,637,479	19,163	6,100,232	115,423,500	26,448,900	105,250,800	$49,971,332
1949	15	2,297,584	15,757	5,636,112	111,890,500	22,979,600	95,963,100	43,225,091
1882–1949		(1)	2,080,918	562,773,334	(2) 6,714,663	(2) 270,211	(2) 1,712,089	2,734,988,313

1 Figure not available.
2 Short tons.

Summit Valley (Butte) District.—Company material treated at the copper concentrator of the Anaconda Copper Mining Co. at Anaconda comprised 1,180,750 tons of copper ore from the main Butte Hill mine (1,277,349 in 1948), 1,438 tons from the Greater Butte project (15,164 tons in 1948), and 22,198 tons of special waste (63,327 tons in 1948). Direct smelting ores totaled 39,927 tons (10,859 tons in 1948) and mine-water precipitates 3,838 tons (4,267 tons in 1948).

Production of zinc-lead ore from the Butte Hill mine of the Anaconda Copper Mining Co. was 747,962 tons in 1949 (748,957 tons in 1948) and that from the Butte Hill dumps 261,958 tons (345,539 tons in 1948). The company-operated Emma mine had an output of 27,430 tons of zinc-lead ore and middling from the treatment of manganese ore (36,150 tons in 1948). Zinc-lead middling (6,931 tons) was also produced in milling manganese ore from the Travona mine, which was treated further at the Anaconda zinc concentrator. The Poulin mine, operated under lease from the Anaconda Copper Mining Co., produced 2,483 tons of zinc-lead milling ore compared with 6,497 tons in 1948.

Remaining district output was mainly silver ore and old silver tailings—5,355 tons from the Alloy dumps, 140 tons from the Magna Charta mine, 113 tons from the Hecla claim, and 40 tons from the Nettie mine.

Nevada

Gold, Silver, Copper, Lead, and Zinc

(MINE REPORT)

By R. B. Maurer

GENERAL SUMMARY

NEVADA lead output in 1949 was the highest in 13 years despite production curtailments due to a severe winter and operational difficulties at many mines resulting from lower prices for the metal. Zinc production, similarly affected, nevertheless was held at a relatively high level during 1949, surpassing the 1948 yield by a small margin. With large-scale copper mining dormant in all but one Nevada district, the 1949 copper output followed the trend of progressively lower yield begun in 1943 and reversed only during 1947. The persistence of operators—facing a fixed price for gold—in striving to revive State gold mining resulted in a substantially increased output of the precious metal compared with 1948. Silver, largely a byproduct metal in 1949, made a small gain over the previous year. The total value of gold, silver, copper, lead, and zinc recovered from ores, old tailings, and gravels mined at 332 lode mines and 37 placer properties was $29,615,777, compared with $34,055,480, the output of 350 lode and 36 placer mines in 1948—a decrease of 13 percent, due largely to the recession in copper.

Comparing 1949 with 1948, the gold output increased 17 percent in quantity and value; copper decreased 16 percent in quantity and 24 percent in value; silver increased 1 percent in quantity and value; lead increased 9 percent in quantity but decreased 4 percent in value; and zinc increased 1 percent in quantity but decreased 6 percent in value. Of the total value of the five metals, copper comprised 51 percent, zinc 17 percent, gold 15 percent, lead 11 percent, and silver 6 percent.

White Pine County produced 56 percent of the State total value of the five metals in 1949; it stood first in the output of copper and gold, third in lead, fourth in zinc, and fifth in silver. Lincoln County was in second place, with 27 percent of the State total value, and led the State in production of silver, lead, and zinc.

All tonnage figures are short tons and "dry weight"; that is, they do not include moisture.

Yardage figures used in measuring material treated in placer operations are "bank measure"; that is, the material is measured in the ground before treatment.

The value of metal production reported herein has been calculated at the prices in the accompanying table.

Prices of gold, silver, copper, lead, and zinc, 1945–49

Year	Gold [1] (per fine ounce)	Silver [2] (per fine ounce)	Copper [3] (per pound)	Lead [3] (per pound)	Zinc [3] (per pound)
1945	$35.00	$0.711+	$0.135	$0.086	$0.115
1946	35.00	.808	.162	.109	.122
1947	35.00	.905	.210	.144	.121
1948	35.00	.905+	.217	.179	.133
1949	35.00	.905+	.197	.158	.124

[1] Price under authority of Gold Reserve Act of Jan. 31, 1934. Treasury legal coinage value of gold from Jan. 18, 1837, to Jan. 31, 1934, was $20.67+ ($20.671835) per fine ounce.
[2] Treasury buying price for newly mined silver. 1945 to June 30, 1946: $0.71111111; July 1, 1946, to Dec. 31. 1947: $0.905; 1948–49: $0.9050505.
[3] Yearly average weighted price of all grades of primary metal sold by producers. Price in 1945–47 includes bonus payments by Office of Metals Reserve for overquota production.

Mine production of gold, silver, copper, lead, and zinc in Nevada, 1945–49, and total, 1859–1949, in terms of recoverable metals

Gold.—Increased output in 1949 from rehabilitated gold mines, notably in Esmeralda, Humboldt, and Storey Counties, was largely responsible for the 17-percent increase in Nevada gold production over 1948. The yield from placer mines decreased 3 percent, owing principally to cessation of production at the major placer mine for 8 months of 1949 while equipment was being converted. Gold from lode mines—which accounted for 94 percent of the State total gold production—increased 18 percent. The monthly production figures in the accompanying table show the adverse effect of a severe winter on gold output in January and February, followed by a fairly uniform rate of production through June. The curtailment of base-metal ore production following reduction of metal prices and resultant lowering of byproduct gold output caused the abrupt drop in July, whereas the

increased yield of gold from base-metal ores augmented by an accelerated rate of output from gold mines is reflected in the monthly totals from August through December. In 1949 byproduct gold from base-metal ores comprised 34 percent of the gold output (38 percent in 1948) whereas gold recovered from precious-metal ores was 60 percent of the total (55 percent in 1948).

The 10 leading gold producing mines in 1949 contributed 83 percent of Nevada's output, the 3 leaders producing 49 percent.

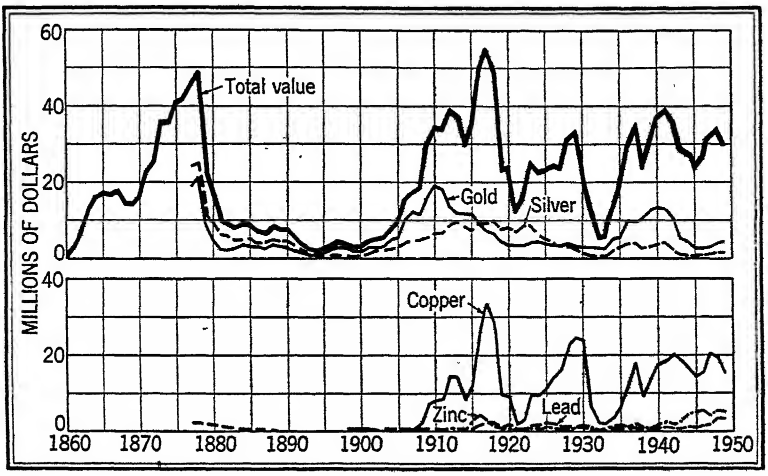

FIGURE 1.—Value of mine production of gold, silver, copper, lead, and zinc and total value in Nevada, 1860–1949.

Silver.—Production of silver in Nevada in 1949 increased 1 percent compared with 1948; the greater yield of silver from base-metal ores and from dry gold ore more than compensated for the lower output of the metal from dry gold-silver and silver ores. Base-metal ores were the source of 57 percent of the State silver production in 1949 (52 percent in 1948), whereas 17 percent (21 percent in 1948) was from straight silver ore. Monthly production of silver, as shown in the accompanying table, reflects its role as a byproduct metal. The yield of silver follows closely the trend of base-metal output, particularly lead; low monthly production was reached in July following the year's low point in base-metal prices reached in June 1949.

Copper.—As in 1948, Nevada copper production was centered in the Robinson (Ely) district, White Pine County, where the State's two leading producers—Kennecott Copper Corp. and Consolidated Coppermines Corp.—supplied all but a small percentage of the State total 1949 output. The monthly yield from the two major mines is the background of the State total given in the accompanying table. The reduced monthly output in July, due to a lower average price for copper, was followed by increased but still curtailed production during the remainder of 1949. Data on a copper deposit were published.[1]

December	12,972	140,971	2,816	778	1,573
Total 1949	130,399	1,800,209	38,058	10,626	20,443

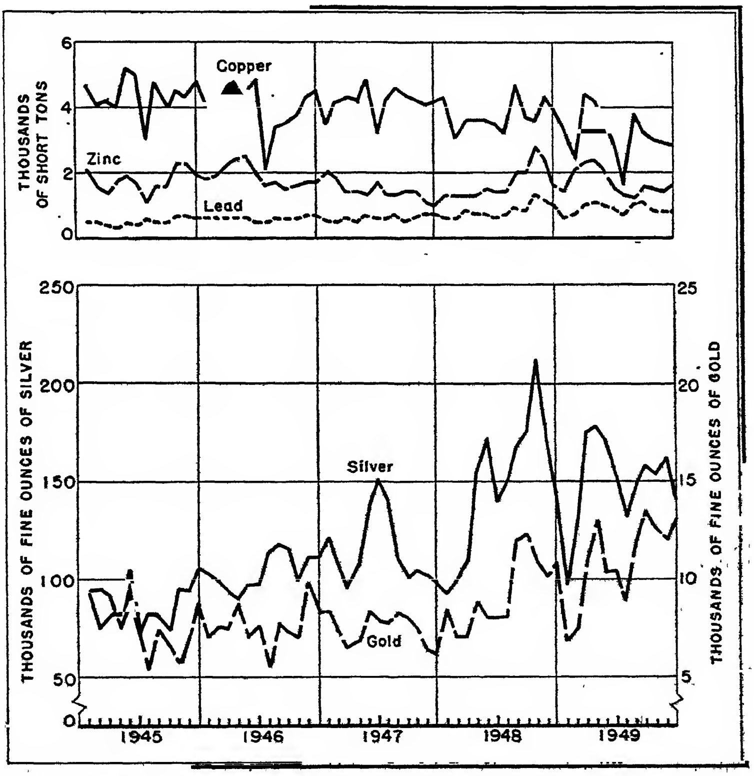

FIGURE 2.—Mine production of gold, silver, copper, lead, and zinc in Nevada, 1945–49, by months, in terms of recoverable metals.

Lead.—Of the recoverable lead produced in Nevada in 1949, 62 percent was mined in the Pioche district, Lincoln County, where its output was closely associated with the production of zinc. The leading properties were: The Pioche groups operated by Combined Metals Reduction Co., the Ely Valley mine by Ely Valley Mines, Inc., and the

Prince mine by Prince Consolidated Mining Co. The Copper Canyon mine (Copper Canyon Mining Co.), Battle Mountain district, Lander County—Nevada's second-largest producer of lead in 1949—was developed during 1948. Other important lead producers were: L. F. Jacobson, Yellow Pine mine,[2] Yellow Pine District, Clark County; and McFarland & Hullinger, Cleveland mine, Delano district, Elko County. Data on a zinc-lead-silver mine were published.[3]

Zinc.—Nevada zinc production was centered in the Pioche district and adjacent Comet district, both in Lincoln County, where 92 percent of the State total was mined. Nevada's leading producers, in the order named, were: Combined Metals Reduction Co. and Ely Valley Mines, Inc., both in the Pioche district; Copper Canyon Mining Co., Battle Mountain district, Lander County; and L. F. Jacobson (Yellow Pine mine), Yellow Pine district, Clark County. The full impact of zinc price reductions in the March–June 1949 period was not felt until August, when monthly output reached the low point of the year; output from September through December was on a curtailed basis.

[2] Placer production from Lander and Humboldt counties combined to avoid disclosure of output.

MINING INDUSTRY

The 17-percent decrease (due principally to copper ore) in total tonnage of ores and old tailings sold or treated in 1949 compared with 1948 shows an increase in dry ores and a decrease in all base-metal ores except zinc-lead ore, lead-copper ore, and zinc-lead-copper ore. The collapse of base-metal prices largely in the second quarter of 1949, followed by curtailed output of copper, lead, and zinc and corresponding retrenchment in mining-operation costs, is reflected in the mining of smaller tonnages of ores with higher base-metal content. Increased activity in gold-mining districts and concentrating silver ore for recovery of contained base metals resulted in higher output of dry and siliceous ores. Data on shaft equipment were published.[4]

Late in 1949 the bucket-line dredge of the Natomas Co. (largest producer of placer gold in Nevada) began deep dredging in the Battle Mountain district, Lander County; its output, with that of the Southwest Dredging Co. dragline and shovel equipment in the Rochester district, Pershing County, comprised a large percentage of the State placer gold. In all, 1,382,140 cubic yards of material were treated at Nevada placer mines in 1949 compared with 762,500 cubic yards in 1948, an increase of 81 percent, due largely to mechanization.

ORE CLASSIFICATION

The accompanying table classifying ores sold or treated in Nevada in 1949 shows that 82 percent of the tonnage (including old tailings) was copper ore; 11 percent gold ore and old tailings; 3 percent zinc-lead ore; 1 percent each, silver ore and old tailings, gold-silver ore and old tailings, and zinc ore; and the remainder, lead ore and old tailings, lead-copper ore, and zinc-lead-copper ore.

Details of ore classification are given in the Gold and Silver chapter of this volume.

[2] Excludes tungsten ore.
[3] Includes metal recovered from tungsten ore.
[4] Includes 2,055,200 pounds of copper from precipitates.

METALLURGIC INDUSTRY

Of the 5,987,013 tons of lode material (including 48,212 tons of old tailings) from Nevada mines sold or treated during 1949, 99 percent went to mills and 1 percent to smelters. In addition to companies that operated metallurgical plants exclusively for their ores, the Combined Metals Reduction Co. at Pioche, Lincoln County, treated by selective flotation zinc and zinc-lead ores on a custom basis for several neighboring mines and also milled company zinc-lead ores. The Kennecott Copper Corp. treated all the copper ore produced by Consolidated Coppermines Corp. on a contract basis, in addition to milling its own ore at the McGill concentrator. Kennecott also operated the McGill copper smelter, Nevada's only smelter, treating—in addition to copper ore and copper concentrate—siliceous gold and silver ores used for fluxing. The Dayton Consolidated Mining Co. beneficiated ore and tailings from mines in seven Nevada counties at the company flotation-cyanide mill in the Comstock district, Storey County, and Double King Mines, Inc. (W. F. Donovan), accepted ore on a custom basis at its cyanide mill in the Silver City district, Lyon County, during 1949.

Mine production of metals in Nevada in 1949, by methods of recovery, in terms of recoverable metals

Method of recovery	Gold (fine ounces)	Silver (fine ounces)	Copper (pounds)	Lead (pounds)	Zinc (pounds)

REVIEW BY COUNTIES AND DISTRICTS

CHURCHILL COUNTY

Holy Cross District.—Clarke C. Shaw worked the Camp Terrell mine throughout 1949; 125 tons of mine and dump ore milled yielded 3 tons of lead concentrate containing 7 ounces of gold, 1,043 ounces of silver, and 1,528 pounds of lead.

Sand Springs District.—Summit King Mines, Ltd. (third largest producer of silver in Nevada in 1949), operated the Summit King group the entire year; 3,637 ounces of gold and 174,718 ounces of silver were recovered from 18,208 tons of gold-silver ore cyanided at the company 60-ton mill.

CLARK COUNTY

Searchlight District.—The Desert Milling Co. recovered 576 ounces of gold and 2,224 ounces of silver from 16,076 tons of Quartette mine tailings by cyanidation at the company 100-ton mill during 1949.

[1] Only those districts shown separately for which Bureau of Mines is at liberty to publish figures; other producing districts listed in footnote 9 and their output included with "Other districts."
[2] Excludes itinerant prospectors, snipers, high-graders, and others who gave no evidence of legal right to property.
[3] Source of total silver as follows: 1,798,533 ounces from lode mines and 1,676 ounces from placers.
[4] Lynn district lies in Elko and Eureka Counties.
[5] Included with "Other districts."
[6] Exclusive of lode output which is included with "Other districts."
[7] Exclusive of placer output which is included with "Other districts."
[8] From property not classed as a mine.
[9] Includes following districts: Ruby Valley in Elko County; Goldfield in Esmeralda County; Potosi in Humboldt County; Battle Mountain (placer) in Lander County; Candelaria (Columbus) and Aurora in Mineral County; Union in Nye County; Table Mountain in Pershing County; and Olinghouse in Washoe County.
[10] Excludes tungsten ore.
[11] Includes 1,038,400 pounds contained in precipitates.

Yellow Pine District.—Otto F. Schwartz and Milton T. Schwartz worked the Combination group from February through December 1949; 88 tons of lead ore containing 1 ounce of gold, 140 ounces of silver, 49,019 pounds of lead, and 8,701 pounds of zinc was shipped to a smelter. During 1949 the Anchor Lease shipped to smelters 283 tons of ore and concentrate, mixed, containing, in recoverable metals, 2 ounces of gold, 1,485 ounces of silver, 400 pounds of copper, 220,400 pounds of lead, and 24,700 pounds of zinc. R. K. Hamilton operated a 75-ton gravity-concentration mill during 1949; ore from the Kirby, Bullion, Root-Zinc, Hoosier, and Ruth properties was treated, and the lead concentrate produced was shipped to a smelter. L. F. Jacobson (Yellow Pine Lease) shipped zinc-lead ore to a smelter from the Yellow Pine, Sultan, and Thomas & Reed mines in 1949; zinc-lead ore from the Prairie Flower mine was treated at a concentrator-smelter.

ELKO COUNTY

Delano District.—Lee H. Bayliss leased the Delno mine from January 1 to November 5, 1949, and shipped 1,356 tons of lead ore containing 6 ounces of gold, 24,734 ounces of silver, 7,073 pounds of copper, and 427,550 pounds of lead to smelters. McFarland & Hullinger shipped lead ore from the Cleveland mine to smelters during 1949.

Lynn District.—Bootstrap Gold Mining Co. developed the Bootstrap mine on Boulder Creek throughout 1949; 104 tons of ore shipped to a smelter contained 70 ounces of gold, 27 ounces of silver, and 209 pounds of copper.

Mountain City (Cope) (Van Duzer) District.—Price D. Montrose and Thos. White shipped 58 tons of ore containing 34 ounces of silver and 24,451 pounds of copper from the Rio Tinto dump to a smelter during 1949. Onstott & Trickey Gold Dredging Co., operating a dragline and trommel on the Estella claim, recovered 118 ounces of gold and 15 ounces of silver from 6,000 cubic yards of gravel treated.

Ruby Range District.—Streeter Lead Co. shipped 16 tons of ore containing 51 ounces of silver, 49 pounds of copper, and 11,346 pounds of lead from the Summit View mine (open cut) to a smelter in 1949.

ESMERALDA COUNTY

Divide District.—Tonopah Divide Mining Co. and lessees shipped 325 tons of ore containing 33 ounces of gold and 8,861 ounces of silver to a smelter and 56 tons of ore containing 2 ounces of gold and 1,125 ounces of silver to a custom cyanide mill from the Tonopah Divide mine in 1949.

Goldfield District.—Goldfield Deep Mines Co. of Nevada operated the Deep Mines group and milled gold ore at the company 100-ton flotation mill throughout 1949. Concentrate shipped to a smelter yielded substantial quantities of gold and silver.

Lida District.—McBoyle, Hain & Bundy worked the Wisconsin group from March 1 to November 1, 1949; 14 tons of ore cyanided at a custom mill yielded 3 ounces of gold and 185 ounces of silver, and 13 tons of ore shipped to a smelter yielded 21 ounces of gold and 729 ounces of silver. A. A. Goehring and associates recovered 40 ounces of gold and 17 ounces of silver from 3,400 cubic yards of gravel at

the Tule Summit mine in 1949; the material was moved mechanically to a sluice box.

Silver Peak District.—Nivloc Mines, Inc., and lessees shipped 687 tons of ore containing 34 ounces of gold and 11,738 ounces of silver to a smelter from the Nivloc mine during 1949.

Tokop District.—W. H. Brown worked the Visuanqua (Shields) mine from May to December 1949; 43 tons of ore containing 3 ounces of gold and 792 ounces of silver were cyanided at a custom mill, and 16 tons of ore containing 2 ounces of gold and 455 ounces of silver were shipped to a smelter.

EUREKA COUNTY

Eureka District.—Silver Rock Mines Co., R. A. Glenny, lessee, shipped 21 tons of ore containing 1 ounce of gold and 481 ounces of silver to a smelter from the Silver Rock mine during 3 months of 1949. Lone Mountain Lease (Charles A. Vaccarro) shipped zinc ore (501 tons containing 42 ounces of silver, 28,500 pounds of lead, and 216,900 pounds of zinc) from the Mountain View group of claims to a smelter in 1949.

HUMBOLDT COUNTY

Awakening District.—Red Ledge Mining Co. and its successor, Austin Jumbo Mines, Inc., operating the Austin (Jumbo) open-pit mine during 1949, recovered 1,692 ounces of gold and 1,169 ounces of silver by amalgamation from approximately 57,000 tons of ore treated at the company 500-ton mill.

Potosi District.—Getchell Mine, Inc., (second-largest producer of gold in Nevada in 1949), operated its rehabilitated 1,500-ton flotation-cyanide mill and the Getchell mine throughout 1949; in addition, the Pinson-Ogee lease was worked from January to April 1949.

Warm Springs District.—T. C. Hapgood operated the Silver Cloud mine near Dyke Canyon from May 20 to August 20, 1949, and shipped 41 tons of ore containing 16 ounces of gold, 913 ounces of silver, 109 pounds of copper, 1,461 pounds of lead, and 1,217 pounds of zinc to a smelter.

LANDER COUNTY

Battle Mountain District.—Copper Canyon Mining Co. worked the Copper Canyon mine and 350-ton flotation mill throughout 1949; 72,132 tons of ore treated yielded 4,565 tons of bulk concentrate (containing 1,003 ounces of gold, 184,829 ounces of silver, 126,372 pounds of copper, 2,621,040 pounds of lead, and 1,325,380 pounds of zinc) which was shipped to a smelter. In addition, lessees worked the company Copper King, Carrissa, and Sweet Marie claims in Copper Basin and shipped gold and copper ores to smelters. The Natomas Co. operated its Natomas-type electric bucket-line dredge (120 $9\frac{1}{2}$-cubic-foot buckets) at Greenan Placers from August 30 to December 31, 1949, recovering a substantial quantity of gold and some silver. Dragline dredging operations at this property ceased September 28, 1948.

Bullion District.—The London Extension Mining Co. (third-largest producer of gold in Nevada) worked the Goldacres open-pit mine throughout 1949, recovering gold and silver by cyanidation at its 350-ton plant.

Hilltop District.—Paul C. Christopher worked the Paymaster mine from May 1 to October 1, 1949, and shipped 48 tons of ore (containing 9 ounces of gold, 1,018 ounces of silver, 202 pounds of copper, 2,874 pounds of lead, and 480 pounds of zinc) to a smelter.

LINCOLN COUNTY

Comet District.—Comet Mines, Inc., operated the Comet mine throughout 1949 and trucked zinc ore to the Combined Metals Reduction Co. Castleton mill for concentration. Silver ore was shipped for direct smelting. Data on a zinc-lead deposit were published.[5]

Eagle Valley District.—Lytle, Jones & Jones worked the Silver Star mine during June and July 1949; 12 tons of ore trucked to a smelter yielded 1 ounce of gold and 634 ounces of silver.

Groom District.—Dan Sheahan operated the Groom mine and 50-ton gravity and flotation mill from January through November 1949; 1,640 tons of ore treated yielded 116 tons of concentrate containing 940 ounces of silver and 152,646 pounds of lead. The concentrate and 50 tons of ore containing 265 ounces of silver and 30,303 pounds of lead were shipped to a smelter.

Jack Rabbit District.—Bristol Silver Mines Co. worked the Bristol mine throughout 1949 and shipped lead and copper ores, each containing gold, silver, copper, lead, and zinc, to smelters.

Pioche District.—The Combined Metals Reduction Co. in 1949 milled 9 percent more company ore but 40 percent less custom ore than in 1948. Company zinc-lead ore was derived from the Abe Lincoln group, the Pioche 802 Division, and the Pioche, Wenlock Free, and Pan American (Comet district) leases. Custom zinc and zinc-lead ores came principally from the Ely Valley Mines, Inc., Ely Valley mine (second-largest producer of zinc in Nevada in 1949), the Prince Consolidated Mining Co. Prince mine, and Raymond Ely West Mining Co. The mill products were lead and zinc concentrates, which were shipped to smelters. In addition, the Prince Mining Co. shipped lead and silver ore for direct smelting; its operation closed down July 19, 1949. Ely Valley Mines, Inc., and lessees worked the Mendha mine throughout 1949, shipping lead ore to a smelter. The Salt Lake Pioche Mining Co. shipped lead ore from the Apex and Financier mines to smelters during 1949.

LYON COUNTY

Silver City District.—Double King Mines, Inc. (W. M. Donovan), operated the Donovan cyanide mill at Silver City in 1949, principally on ore from the company Silver Hill mine (Storey County). Small lots of ore from neighboring mines were milled on a custom basis. The Dayton Consolidated Mines Co. and lessees worked the Dayton and Oest mines during 1949. Other mines active in 1949 included the Buckeye, Triangle, Milwaukee, Montezuma, Research No. 1, Spring Valley, and Three Brothers.

[5] Trengove, Russell R., Investigation of Comet Coalition Lead-Zinc Deposit, Lincoln County, Nev.: Bureau of Mines Rept. of Investigations 4541, 1949, 6 pp.

MINERAL COUNTY

Aurora District.—Chessher & Co. operated the Chesco mine and mill during 1949. Most of the gold concentrate produced was cyanided at the Central Comstock Mines Co. mill in Storey County; small lots were shipped direct to a smelter.

Candelaria (Columbus) District.—G. A. Peterson worked the New Potosi, Mount Ridge, and Mount Potosi claims throughout 1949 and shipped lead ore containing some gold, silver, and copper to smelters.

Rawhide (Regent) District.—Rawhide Queen Mining Co. operated the Rawhide Queen mine from October 1 to November 15, 1949. Approximately 545 tons of ore cyanided at the company 50-ton mill yielded 23 ounces of gold and 283 ounces of silver.

NYE COUNTY

Bullfrog District.—Homer Weeks and associates operated the Senator Stewart mine in 1949; gold and silver was recovered from the gold ore by amalgamation and cyanidation at custom mills and from concentrate shipped to a smelter.

Cloverdale District.—Dunsdon & Cornell worked the Nevada group (Republic) from June 15 to November 1, 1949; 12 tons of ore containing a trace of gold and 467 ounces of silver were shipped to a smelter.

Jett District.—Valley Silver & Lead Co. operated the Valley Silver-Lead mine from June 1 to August 31, 1949; 2½ tons of ore shipped to a smelter contained 85 ounces of silver, 14 pounds of copper, and 1,170 pounds of lead.

Manhattan District.—Louis Cereghino, lessee, shipped 71 tons of ore containing 43 ounces of gold and 26 ounces of silver to a smelter in 1949. Albert White and George Rong recovered 12 ounces of gold and 6 ounces of silver by amalgamating 45 tons of gold ore at the Orphant mine from January to June 1949. Fehn, Johnson & Pittser recovered 687 ounces of gold and 241 ounces of silver in 1949 from gravel in Manhattan Gulch, using a power shovel, trommel, and jigs.

Quartz Mountain District.—Obie LeFavor shipped lead ore to a smelter from the San Rafael mine during 1949.

San Antone District.—Hubert Welch shipped 33 tons of ore containing 3 ounces of gold and 374 ounces of silver from the Cloverdale mine and 44 tons of ore containing 1 ounce of gold and 495 ounces of silver from the Green Metals mine to a smelter in 1949.

Troy District.—Old English Gold Corp. worked the Old English mine from January 1 to August 18, 1949; 1,215 tons of ore amalgamated yielded 328 ounces of gold and 48 ounces of silver and 24 tons of concentrate shipped to a smelter contained 80 ounces of gold and 77 ounces of silver.

PERSHING COUNTY

Humboldt District.—Wallace Calder recovered 32 ounces of gold and 16 ounces of silver from 600 cubic yards of gravel at the Wadley mine during 3 months of 1949, operating a dragline, bulldozer, and trommel.

Rochester District.—The Southwest Dredging Co. (second-largest producer of placer gold in Nevada in 1949) worked its excavating

equipment and dry-land washing plant at Spring Valley Placers during 1949.

Rye Patch (Echo) District.—The Standard Cyaniding Co. treated ore from its Standard (Lally) open-pit mine by cyanidation until May 1949, when the property was closed down.

STOREY COUNTY

Comstock District.—Central Comstock Mines Corp. treated Central Comstock tailings by cyanidation from August 1 to December 31, 1949, recovering substantial quantities of gold and silver. Consolidated Chollar, Gould & Savage Mining Co. operated the Overman open-pit mine throughout 1949 and recovered 9,665 ounces of gold and 147,240 ounces of silver from 167,423 tons of ore treated at the company 500-ton cyanide mill. Dayton Consolidated Mines Co. operated its cyanide plant on custom ores from various mining districts in Nevada and California in addition to treating ore from the company Keystone, Justice, and Woodville mines and the Dayton and Oest mines in Lyon County. Double King Mines, Inc. (W. M. Donovan), worked the Silver Hill open-pit mine during 1949 and treated the ore by cyanidation in the company mill at Silver City.

WASHOE COUNTY

Galena District.—Benjamin J. Constant operated the Galena Hill mine during August 1949 and shipped 2 tons of ore containing 17 ounces of silver, 7 pounds of copper, and 744 pounds of lead to a smelter. Data on a zinc-lead mine were published.[6]

WHITE PINE COUNTY

Aurum District.—The Grand Deposit Mining Co. worked the Grand Deposit mine throughout 1949 and shipped 756 tons of ore containing 9 ounces of gold, 1,844 ounces of silver, 7,251 pounds of copper, 239,123 pounds of lead, and 68,168 pounds of zinc to a smelter. Sound State Metals, Inc., operated the Sound State mine from June 15 to October 14, 1949; 108 tons of ore containing 1 ounce of gold, 160 ounces of silver, 2,011 pounds of copper, and 49,133 pounds of lead were shipped to smelters.

Black Horse District.—H. B. Hersey & Anna Lee Tilford shipped 16 tons of ore containing 1 ounce of gold and 532 ounces of silver to a smelter from the Anna Lee mine in 1949.

Mount Washington District.—Hulse & Cottino operated the St. Lawrence mine from July 9 to October 9, 1949; 8 tons of ore trucked to a smelter contained 54 ounces of silver, 10 pounds of copper, and 3,028 pounds of lead.

Osceola District.—The Kenison-Alverson Lease shipped 355 tons of ore with a gross metal content of 5 ounces of gold, 696 ounces of silver, 59,050 pounds of lead, and 14,070 pounds of zinc to a custom mill for concentration.

Robinson District.—The Kennecott Copper Corp. (Nevada Mines Division) operated the Pit mine jointly with the Consolidated Copper-

[6] Geehan, Robert W., Investigation of the Union Zinc-Lead Mine, Washoe County, Nev.: Bureau of Mines Rept. of Investigations 4623, 1950, 10 pp.

mines Corp. throughout 1949. The ore from this mine and the copper ore produced by the Consolidated Coppermines Corp. was treated at Kennecott's McGill 18,000-ton flotation concentrator and copper smelter. The Consolidated Coppermines Corp. closed its underground copper mines June 30, 1949, but substantial quantities of lead ore and zinc ore were shipped to smelters from 12 claims by lessees throughout 1949.

Ward District.—The O. B. Mining Co. worked the Pleadis-Good Luck mine from July to October 1949 and shipped 17 tons of ore containing 134 ounces of silver, 300 pounds of copper, 4,345 pounds of lead, and 880 pounds of zinc to a smelter.

White Cloud District.—C. F. Crafts & Lowell Peterson operated the Lead King mine from May 1 to December 31, 1949; 52 tons of ore containing 105 ounces of silver, 182 pounds of copper, 18,302 pounds of lead, and 982 pounds of zinc were shipped to a smelter.

White Pine District.—Kidder & King, lessees, and Hamilton Leasing Co., sublessees, worked the Onetha claim from March 1 to December 31, 1949; 542 tons of ore containing 4 ounces of gold, 3,703 ounces of silver, 14,660 pounds of copper, 264,262 pounds of lead, and 68,181 pounds of zinc were shipped to a smelter.

New Mexico

Gold, Silver, Copper, Lead, and Zinc

(MINE REPORT)

By A. J. Martin

GENERAL SUMMARY

THE OUTPUT of copper, lead, and zinc decreased heavily in New Mexico in 1949. The 49-percent decline in the price of zinc from March to June, with high production costs continuing, led to the closing by July 15 of all but one of the State's seven major zinc-producing mines and most of the small-scale operations. The output of recoverable zinc in the latter half of the year was only 5,749 tons compared with 23,597 tons in the first half; the total for the year decreased 29 percent from 1948 and was the lowest since 1938. The production of lead, the bulk of which comes from mines yielding chiefly zinc, decreased 39 percent. Copper output decreased 26 percent, although the monthly production rate was fairly steady throughout the year despite a sharp decline in the price of copper. The large Chino open-pit mine in Grant County and the Bonney-Miser's Chest and Atwood mines in Hidalgo County operated continuously. The copper-leaching operation at the Burro Mountain mine in Grant County shut down April 30. Nearly all the gold and silver production was derived from base-metal ores; the total quantity of gold recovered decreased 5 percent, and silver 29 percent from 1948. The total value of the output of the five metals decreased from $46,799,576 in 1948 to $31,029,120 in 1949.

All tonnage figures are short tons and "dry weight"; that is, they do not include moisture.

The value of the metal production reported herein has been calculated at the following prices.

Prices of gold, silver, copper, lead, and zinc, 1945–49

Year	Gold [1] (per fine ounce)	Silver [2] (per fine ounce)	Copper [3] (per pound)	Lead [3] (per pound)	Zinc [3] (per pound)
1945	$35.00	$0.711+	$0.135	$0.086	$0.115
1946	35.00	.808	.162	.109	.122
1947	35.00	.905	.210	.144	.121
1948	35.00	.905+	.217	.179	.133
1949	35.00	.905+	.197	.158	.124

[1] Price under authority of Gold Reserve Act of Jan. 31, 1934. Treasury legal coinage value of gold from Jan. 18, 1837, to Jan. 31, 1934, was $20.67+ ($20.671835) per fine ounce.
[2] Treasury buying price for newly mined silver. 1945 to June 30, 1946: $0.71111111; July 1, 1946, to Dec. 31, 1947: $0.905; 1948–49: $0.9050505.
[3] Yearly average weighted price of all grades of primary metal sold by producers. Price in 1945–47 includes bonus payments by Office of Metals Reserve for overquota production.

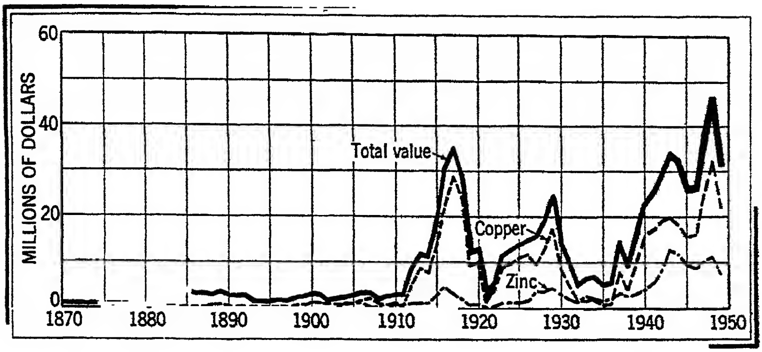

FIGURE 1.—Value of mine production of copper and zinc and total value of gold, silver, copper, lead, and zinc in New Mexico, 1870–1949. The value of gold, silver, and lead produced annually has been relatively small.

Mine production of gold, silver, copper, lead, and zinc in New Mexico in 1949, by months, in terms of recoverable metals

Month	Gold (fine ounces)	Silver (fine ounces)	Copper (short tons)	Lead (short tons)	Zinc (short tons)
January	267	34,100	4,658	487	3,230
February	264	34,800	4,620	610	3,730
March	356	48,450	5,220	858	4,315

November	253	26,400	4,390	59	800
December	234	25,900	5,050	55	811
Total: 1949	3,249	380,855	55,388	4,652	29,346
1948	3,414	537,674	74,687	7,653	41,502

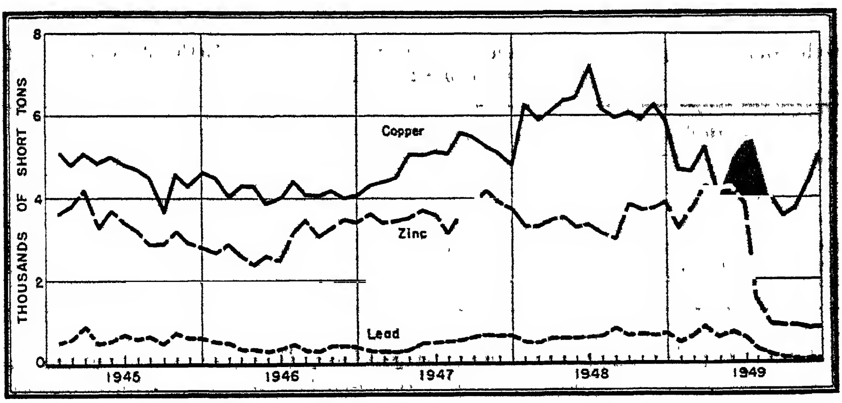

FIGURE 2.—Mine production of copper, lead, and zinc in New Mexico, by months, 1945–49, in terms of recoverable metals.

The following table shows the number of mines in New Mexico producing gold, silver, copper, lead, and zinc and their annual output of ore and metals from 1945 to 1949, as well as the total production from 1848 to 1949. The report of this series for 1929 (chapter of Mineral Resources of the United States, 1929, pt. 1, pp. 729–759) gives the yearly production of each important metal-producing district in New Mexico from 1904 to 1929, inclusive. Subsequent records, year by year, may be found in annual issues of Mineral Resources and Minerals Yearbook.

Mine production of gold, silver, copper, lead, and zinc in New Mexico, 1945–49, and total, 1848–1949, in terms of recoverable metals

Year	Mines producing		Ore (short tons)	Gold (lode and placer)		Silver (lode and placer)	
	Lode	Placer		Fine ounces	Value	Fine ounces	Value
1945	46	4	6,843,327	5,604	$196,140	465,127	$330,757
1946	50	4	6,594,890	4,009	140,315	338,000	273,104

[1] Figures not available.

Gold and silver produced at placer mines in New Mexico, 1945–49, in terms of recoverable metals

Year	Gold		Silver		Total value	Year	Gold		Silver		Total value
	Fine ounces	Value	Fine ounces	Value			Fine ounces	Value	Fine ounces	Value	
1945	15	$525	7	$5	$530	1948	9	$315	2	$2	$317
1946	10	350	2	2	352	1949	31	1,085	9	8	1,093
1947	23	805	10	9	814						

Gold.—Of the 3,249 fine ounces of gold produced in New Mexico in 1949, copper ore yielded 71 percent, zinc ore 17 percent, gold and silver ores and placer gravel 9 percent, and lead and zinc-lead ores 3 percent. The Atwood copper mine in Hidalgo County was again the only producer of more than 1,000 ounces of gold in the State.

Silver.—Some silver ore was shipped from scattered mines, prospects, and dumps in New Mexico in 1949, but most of the silver output

(380,855 fine ounces) was recovered from base-metal ores. Zinc and zinc-lead ores yielded 50 percent and copper ore 41 percent of the State total silver. The principal producers of silver were the Atwood copper mine in Hidalgo County, the Ground Hog zinc-lead mine in Grant County, and the Bonney-Miser's chest (Banner) copper mine in Hidalgo County.

Copper.—The bulk of the New Mexico output of copper in 1949, as in the past, came from the Chino open-pit mine of the Kennecott Copper Corp. at Santa Rita, Grant County. Other substantial producers were the Bonney-Miser's chest and Atwood mines in Hidalgo County. The leaching operation of the Phelps Dodge Corp. at its Burro Mountain mine at Tyrone, Grant County, shut down April 30. The State output of recoverable copper was 55,388 short tons compared with 74,687 tons in 1948. Copper ore and precipitates yielded 99 percent of the State total copper in both years.

Lead.—The New Mexico output of lead comes largely from mines yielding chiefly zinc. Lead ore mined in 1949 totaled 7,152 tons and zinc-lead ore 58,590 tons, compared with 12,671 and 124,921 tons, respectively, in 1948. The total output of recoverable lead was 4,652 tons in 1949 and 7,653 tons in 1948. The principal producers of lead in 1949 were the Bayard and Ground Hog groups in the Central district and the Kelly group (including Lynchburg mine) in the Magdalena district.

Zinc.—Successive declines in the price of zinc beginning with a drop from 17.5 to 16 cents a pound March 23 and continuing until a low of 9 cents was reached June 15 caused most of the zinc and zinc-lead mines in New Mexico to shut down. Large producers that suspended operations were the American Smelting & Refining Co. Ground Hog mine, the United States Smelting, Refining & Mining Co. Bayard group, the New Mexico Consolidated Mines Co. Kearney mine, the Kennecott Copper Corp. Oswaldo mine, and the Peru Mining Co. Pewabic mine—all in the Central district, Grant County; and the Waldo mine of the American Smelting & Refining Co. at Magdalena, Socorro County. The first five of the foregoing mines, ranking in the order named, were among the six leading producers of zinc in the State in 1949; the largest producer was the Empire Zinc Co. Hanover mine in the Central district, operated throughout the year. The State output of recoverable zinc in 1949 was 29,346 tons compared with 41,502 tons in 1948. The Central district produced 90 percent, the Magdalena district 8 percent, and other districts 2 percent of the State total zinc in 1949.

MINE PRODUCTION BY COUNTIES

Mine production of gold, silver, copper, lead, and zinc in New Mexico in 1949, by counties, in terms of recoverable metals

County	Mines producing		Gold (lode and placer)		Silver (lode and placer)

MINING INDUSTRY

The sharp declines in prices of copper, lead, and zinc from March to June 1949, without corresponding reductions in the cost of labor and materials used in producing the metals, led to a large decrease from 1948 in the quantity of ores mined in New Mexico. Six of the seven larger producers of zinc and zinc-lead ores had shut down by July 15, laying off more than 1,000 men. Other zinc and lead mines that closed or curtailed operations laid off about 200 men. The output of combined zinc and zinc-lead ores decreased 27 percent and that of copper ore 14 percent from 1948. The Chino open-pit mine of the Kennecott Copper Corp. at Santa Rita, Grant County, was, as usual, much the largest producer of ore in the State.

Work in the Central district on developing zinc-lead ore bodies at greater depth was suspended at some properties, but that at the Ground Hog mine was continued throughout the year, although the mining of ore ceased July 15. The Bureau of Mines made field examinations and metallurgical tests on ores and did exploratory drilling and channel sampling on the Royal John property in Grant County.

ORE CLASSIFICATION

Details of ore classification are given in the Gold and Silver chapter of this volume.

Ore sold or treated in New Mexico in 1949, with content in terms of recoverable metals

Source	Mines producing	Ore (short tons)	Gold (fine ounces)	Silver (fine ounces)	Copper (pounds)	Lead (pounds)	Zinc (pounds)
Dry gold ore	4	290	86	265	748	2,000	3,000
Dry gold-silver ore	4	680	170	5,254	1,790	3,000	
Dry silver ore	8	4,394	7	23,102	1,391	27,832	
Total	16	5,364	263	28,621	3,929	32,832	3,000
Copper ore	9	6,105,174	2,304	155,094	[1] 109,950,057	246,710	
Lead ore	31	7,152	56	7,331	11,342	1,058,957	55,622
Zinc ore	10	363,322	559	140,381	723,804	5,056,881	53,365,787
Zinc-lead ore	11	58,590	36	49,419	86,868	2,908,620	5,267,591
Total	61	6,534,238	2,955	352,225	[1] 110,772,071	9,271,168	58,689,000
Total lode mines	[2] 77	6,539,602	3,218	380,846	[1] 110,776,000	9,304,000	58,692,000
Placers	3		31	9			
Total: 1949	80	6,539,602	3,249	380,855	[1] 110,776,000	9,304,000	58,692,000
1948	93	7,733,163	3,414	537,674	[1] 149,374,000	15,306,000	83,004,000

[1] Copper contained in precipitates recovered from mine water and leached dumps is included with that in copper concentrates as follows: 1949, 30,789,314 pounds of copper; 1948, 38,937,830 pounds of copper.
[2] A mine producing more than 1 class of ore is counted but once in arriving at total for all classes.

METALLURGIC INDUSTRY

Ten flotation mills in New Mexico treated zinc and lead ores in 1949. Of the five larger mills, two were closed in June and one in July, and all three were idle the rest of the year. Three of the five small mills ran intermittently. The daily capacity of the 10 mills ranged from 35 to 1,000 tons and averaged 314 tons. The American Smelting & Refining Co. gave up its lease on the Combination (Blackhawk) mill at Hanover and began constructing a mill at Deming. Still Bros. remodeled a mill at Lordsburg formerly used for fluorspar and treated lead and zinc ores after August. The two mills treating copper ore (the Chino concentrator at Hurley, Grant County, and the Banner Mining Co. mill near Lordsburg, Hidalgo County), operated throughout 1949.

The Chino smelter of the Kennecott Copper Corp. at Hurley treats concentrates from the Chino mill, siliceous copper ore (used as a flux) from the Chino mine, and copper precipitates from company operations at Chino and at Ray, Ariz. The smelter produces fire-refined copper and some blister copper. Direct-smelting ore and lead and copper concentrates from other New Mexico operations were shipped to smelters in Arizona, Illinois, Kansas, Montana, Pennsylvania, and Texas.

Mine production of metals in New Mexico in 1949, by methods of recovery, in terms of recoverable metals

Method of recovery	Gold (fine ounces)	Silver (fine ounces)	Copper (pounds)	Lead (pounds)	Zinc (pounds)
Ore amalgamated	9	7			
Concentrates smelted	1,621	242,479	[1] 109,091,270	8,670,725	58,691,246

REVIEW BY COUNTIES AND DISTRICTS

CATRON COUNTY

Mogollon (Cooney) District.—Mathis & Mathis did repair work at the Lehigh Metals Co. Consolidated group from October 14 through December 1949 and shipped to the El Paso smelter 101 tons of old mill tailings and clean-up material containing gold and silver. Mining was begun January 3, 1950.

DONA ANA COUNTY

Organ District.—The Merrimac mine, operated by J. H. Brown part of 1949, shipped 213 tons of ore containing 1,960 pounds of copper and 50,098 pounds of zinc. M. F. Drunzer shipped copper ore from the Torpedo group during October and November. Some lead-silver ore was shipped from the Hilltop-Black Prince group and the New York claim. The Bureau of Mines began work October 1 on a diamond-drilling research project near Organ.

Mine production of gold, silver, copper, lead, and zinc in New Mexico in 1949, by counties and districts, in terms of recoverable metals

[1] Includes Burro Mountain district gold, silver, and copper, figures for which Bureau of Mines is not at liberty to publish separately.
[2] Includes copper recovered from precipitates.

GRANT COUNTY

Burro Mountain (Tyrone) District.—The copper-leaching operations of the Phelps Dodge Corp. at the Burro Mountain mine, in progress since May 1941, were shut down April 30, 1949. The Malone Darhasana Mining Co. shipped to smelters several hundred tons of gold-silver ore from its mine, operated from January to August. A small lot of lead-silver ore was shipped from the Silver Blade claim.

Camp Fleming District.—C. T. McLendon shipped silver ore from the Old Man dump in 1949.

Central (Bayard, Fierro, Georgetown, Hanover, Santa Rita) District.—The Chino open-pit mine of the Kennecott Copper Corp., Chino Mines Division at Santa Rita, operated continuously in 1949. Rail haulage from the pit was described in a paper by A. P. Morris.[1] The following data were obtained from the paper:

The bottom level of the pit was about 400 feet below the surface on the west side and 650 feet on the east side at the end of 1948. It is anticipated that future operations will extend the depth an additional 250 feet. From 1910 to 1948 about 128,000,000 tons of ore and 180,000,000 tons of waste were removed

[1] Morris, A. P., Rail Haulage at Chino: Min. Eng., October 1949, pp. 44–45.

from the pit by rail haulage; the tonnages for 1948 were 6,700,000 tons of ore and 6,900,000 tons of waste.

In 1949 there were 11 operating benches in the pit. The ore is loaded with electric shovels into standard-gage railroad cars on the benches and hauled out of the pit over the mine railroad to the Atchison, Topeka & Santa Fe Railway branch line west of the pit for delivery to the treatment plants at Hurley, 10 miles from the mine. The concentrator has a daily (maximum) capacity of 22,500 tons. Molybdenite is recovered in the mill as a byproduct. The copper concentrate is smelted in the company smelter adjacent to the mill. The smelter also treats precipitates derived from dump leaching and siliceous copper ore used as a flux. The copper bullion contains minor quantities of gold and silver, which are not recovered from fire-refined copper, the major product of the smelter; the blister copper made contains some recoverable gold and silver. The company operated its Oswaldo zinc mine from January to June 17, shipping the ore to the Empire Zinc Co. mill at Hanover. The total development in the Oswaldo mine at the end of 1949 comprised two vertical shafts 490 and 705 feet deep, 11,247 feet of drifts, and 640 feet of raises.

The Empire Zinc Co. Hanover mine operated continuously and was the largest New Mexico producer of zinc in 1949. The ore was concentrated in the company flotation mill, which also handled custom ore from the Oswaldo, Royal John, and Grand View mines in Grant County and the Kelly group in Socorro County.

In 1949, the American Smelting & Refining Co. operated its Ground Hog zinc-lead mine group and the leased 400-ton Hanover (formerly Combination-Blackhawk) mill from January 1 to July 15. The mill treated company ore from the Ground Hog, Ivanhoe, and Lucky Bill claims and custom ore from the Royal John and Grand View mines. Work on developing the ore deposits in the Ground Hog mine at greater depth continued after mining was suspended. The new four-compartment Star shaft was completed to a depth of 1,926 feet. The new three-compartment No. 5 shaft was sunk to the 1,768-foot level. Drifting during the year totaled 2,583 feet and diamond drilling 7,534 feet.

The Bayard mine of the United States Smelting, Refining & Mining Co., a large producer of zinc-lead-silver ore since March 1943, was closed in June 1949 because of declines in the prices of zinc and lead. The mine is equipped with a 600-ton flotation mill. Until the shut-down the company carried on extensive exploration and development work on the Bayard property, which includes the Bull Frog, Hanover Bessemer, and Shingle Canyon groups.

The Pewabic and Kearney mines, operated respectively by the Peru Mining Co. and its subsidiary, the New Mexico Consolidated Mining Co., were in production from January to June 17; continued operation at that time was not warranted because the price of lead and zinc dropped to a level too low to support the prevailing high production costs. Data on mining methods and costs at the Kearney mine were published during the year.[2]

[2] Storms, Walter R., and Faust, Jerry W., Mining Methods and Costs at the Kearney Zinc-Lead Mine, Central Mining District, Grant County, N. Mex.: Bureau of Mines Inf. Cir. 7507, 1949, 11 pp.

Eureka District (*see also* **Hidalgo County**).—The Hornet mine near Hachita was operated throughout 1949 by Mineral Operations, Inc. The daily production rate was about 40 tons of zinc-lead ore, which was treated in the 100-ton selective-flotation mill at the mine. Some lead-silver ore was shipped from the Kino mine.

Lone Mountain District.—Low-grade silver ore was shipped from the Ben-Hur Mayflower property in 1949.

Pinos Altos District.—The Houston-Thomas mine was operated by Mathis & Mathis in 1949 from January 1 to June 14. The output (shipped to the Peru mill at Deming) totaled 2,844 tons of ore containing 4,609 ounces of silver, 8,576 pounds of copper, 186,646 pounds of lead, and 398,828 pounds of zinc. Other small producers were the Cleveland, Langston, George Schafer, and Uncle John lode properties, and a placer on Bear Creek. Data on mining methods and costs at the Atlas No. 2 mine (idle 1949) were published.[3]

Steeple Rock District.—The Carlisle group was operated in 1949 from January 1 to April 12 by Liberty Mines, Inc. The ore produced was shipped to custom plants in Arizona. The Ontario Mining Co. operated the Ontario mine 8 months and shipped gold-silver ore containing a little lead and copper to the El Paso smelter.

Swartz (Carpenter, Camp Monarch) District.—The Royal John mine was operated by lessees in 1949 and shipped zinc-lead ore to custom mills. The Bureau of Mines carried out a channel sampling and core drilling project on this property during the year. Strong and Harris operated the Grand View mine from January 1 to December 5; the ore produced was shipped to custom mills in the Central district.

GUADALUPE COUNTY

Pintado District.—Drunzer & Casner shipped siliceous copper ore from the Stauber mine to the El Paso smelter in 1949.

HIDALGO COUNTY

Eureka (Sylvanite) District.—Lessees at the Rincon mine shipped several hundred tons of silver-copper ore in 1949. Some ore was shipped from the Last Chance, Lead Queen, and Sylvanite mines.

Lordsburg District.—The Banner Mining Co. Bonney-Miser's Chest group, principal producer of copper in this district since 1936, operated continuously in 1949. Mine development during the year included 10 feet of shaft, 1,386 feet of drifts, 75 feet of raises, and 1,035 feet of diamond drilling. The Bonney property had two vertical shafts 1,500 and 600 feet deep and a 700-foot incline shaft, and the Miser's Chest had a 1,103-foot incline shaft. The ore was treated in the company 500-ton flotation mill, which makes a 97-percent-plus recovery on the copper. C. H. & S. A. McIntosh operated the Atwood copper mine, shipping the ore crude to smelters. The ore yields considerable gold and silver and some lead, in addition to copper. The Lordsburg Mining Co. operated the Millsite mine 6 months and shipped to the Peru mill at Deming 2,333 tons of ore containing 35

[3] Storms, Walter R., Mining Methods and Costs at the Atlas No. 2 Zinc-Lead Mine, West Pinos Altos Mining District, Grant County, N. Mex.: Bureau of Mines Inf. Cir. 7524, 1949, 11 pp.

ounces of gold, 3,220 ounces of silver, 9,328 pounds of copper, 479,515 pounds of lead, and 34,258 pounds of zinc. The mine was taken over November 1 by Strong & Harris, Inc., which carried on development work on the 205-foot level. Still Bros. remodeled a fluorspar mill at Lordsburg and treated ore from the Waldo and Last Chance mines. Other small producers included the Francis K. and Ruth mines.

San Simon District.—Output in 1949 comprised lead-silver-zinc and lead-silver ore from the Silver Hill, Bob Montgomery, King, McGhee, and S. & W. properties.

LINCOLN COUNTY

Nogal (Bonita, Parsons) District.—A truckload each of lead-silver ore was shipped from the Catherine and Silver King mines in 1949.

White Oaks District.—Gold ore was shipped from the Old Abe mine, under development by the Q. B. Q. Co., Inc.

LUNA COUNTY

Cooks Peak District.—The Ethel, Lookout, Rimrock, and Summit mines shipped lead-silver ore in 1949.

Deming District.—The Peru Mining Co. operated its 1,000-ton selective flotation mill at Wemple, 5 miles north of Deming, from January 1 to June 17. The ore treated comprised 82,992 tons from the company Kearney and Pewabic mines in Grant County and 6,902 tons of custom ore from other mines in Grant, Hidalgo, Santa Fe, and Dona Ana Counties and one mine in Arizona. The American Smelting & Refining Co. began work May 1 on constructing a 400-ton selective-flotation mill at Deming for treating company ore from the Ground Hog mine and other custom ores.

OTERO COUNTY

Sacramento District.—M. F. Drunzer shipped a car of lead ore from the Sacramento mine in 1949.

SANTA FE COUNTY

Cerrillos District.—The Cash Entry-Franklin group was operated in 1949 by Moses Enterprises, Inc., from July 1 to December 5. The company drove 50 feet of tunnel and operated the mine and 50-ton mill intermittently. The mill product was lead-silver concentrate. Some ore was shipped from the Marshall Bonanza and Tom Payne mines.

San Pedro or New Placers District.—A lessee at the San Pedro Copper mine shipped a car of copper-gold-silver ore in 1949. A little gold was recovered from the Golden placer.

SIERRA COUNTY

Chloride (Apache, Cuchillo Negro) District.—The Dobies mine, operated in 1949 by Ira L. Moseley, produced 217 tons of ore containing 66,917 pounds of lead, 526 pounds of copper, and 22 ounces of silver. Some copper-silver-gold ore was shipped from the Alta Vista mine, and a little lead ore was produced from the End of the World claim.

Hermosa (Lower Palomas Creek) District.—Alvin W. Emerick worked at his Palomas Chief mine throughout 1949 and shipped 26 tons of ore

containing 731 ounces of silver, 238 pounds of copper, and 1,887 pounds of lead.

Kingston District.—Some ore was shipped from the Kingston and Superior mines in 1949.

Las Animas (Hillsboro) District.—The Bigelow and Snake mines produced a little gold-silver-copper ore.

Pittsburg and Caballos Mountains District.—Lead-silver ore was shipped from the Readjuster mine and concentrated in the Hanson mill at Hot Springs.

Tierra Blanca District.—Assessment work was done at the Lookout mine, and about 50 tons of gold ore were milled for testing in a 2-ton stamp mill on the property.

SOCORRO COUNTY

Hansonberg District (17 miles southeast of Carthage).—The Portales Mining Co. continued to operate its lead mine in 1949. The ore was trucked 30 miles to the company mill at San Antonio for treatment. Some lead ore was shipped in April from the Royal Flush group. This group, comprising 8 claims, and the Mex-Tex group of 50 claims was acquired by the Mex-Tex Mining Co., Inc., September 1, 1949. The new company worked on constructing a 500-ton ore-reduction mill near San Antonio designed to recover lead-silver concentrate, barite, and fluorspar as separate commercial products. The company is also operating a barite-grinding plant.

Magdalena District.—The Waldo zinc-lead mine and 200-ton flotation mill, operated by the American Smelting & Refining Co. (owner) since April 1943, were in production in 1949 from January 1 through June 3, when mining operations were terminated and the mill was shut down. The mill was reopened later to treat custom ore. Lessees operated the Kelly group (including the Lynchburg mine), shipping most of the ore produced to the Empire Zinc Co. mill at Hanover (Grant County) for treatment; the rest (including considerable dump ore) was treated in the Waldo mill. Other producers were the Nitt, Queen, Juanita, and Maher (Metals Limited) groups.

Oregon

Gold, Silver, Copper, Lead, and Zinc

(MINE REPORT)

By R. B. Maurer

GENERAL SUMMARY

OREGON gold production in 1949, due principally to dredging, exceeded the 1948 output by 11 percent but was considerably below the postwar peak of 18,979 ounces attained in 1947, whereas 1949 silver production fell 10 percent below the relatively small yield of the metal in 1948. Renewed interest in exploiting the State ores for base metals in 1949 resulted in a small zinc production—the first reported since 1947, a tenfold increase in copper production, and a 71-percent increase in the yield of lead compared with minor outputs of the two metals in 1948.

The total value of the gold, silver, copper, lead, and zinc (in terms of recoverable metals) produced in Oregon was $592,107 in 1949 compared with $527,064 in 1948 and $4,148,271 in the peak year 1940. It was divided among the metals as follows: Gold, 96 percent; silver, 2 percent; and copper, lead and zinc combined, 2 percent. Grant County replaced Baker County as the leading metal producer in 1949, due largely to increased output from both bucket-line and dragline dredging, and contributed 54 percent of the State total value. Baker County, in second place, supplied 36 percent.

Placer mines contributed 89 percent and lode mines 11 percent of the gold produced in Oregon in 1949. In 1948 the ratio was placer mines 86 percent and lode mines 14 percent.

The 57 Oregon mines (28 lode and 29 placer) that reported production in 1949 represent a decrease of 81 percent in the number of operations compared with the 304 producing mines (112 lode and 192 placer) in 1940—the year of highest recorded total value of output of gold, silver, copper, lead and zinc in Oregon.

All tonnage figures are short tons and "dry weight"; that is, they do not include moisture.

Yardage figures used in measuring material treated in placer operations are bank measure; that is, the material is measured in the ground before treatment.

The value of metal production reported herein has been calculated at the prices in the accompanying table.

Prices of gold, silver, copper, lead, and zinc, 1945–49

Year	Gold [1] (per fine ounce)	Silver [2] (per fine ounce)	Copper [3] (per pound)	Lead [3] (per pound)	Zinc [3] (per pound)
1945	$35.00	$0.711+	$0.135	$0.086	$0.115
1946	35.00	.808	.162	.109	.122
1947	35.00	.905	.210	.144	.121
1948	35.00	.905+	.217	.179	.133
1949	35.00	.905+	.197	.158	.124

[1] Price under authority of Gold Reserve Act of Jan. 31, 1934. Treasury legal coinage value of gold from Jan. 18, 1837, to Jan. 31, 1934, was $20.67+($20.671835) per fine ounce.
[2] Treasury buying price of newly mined silver. 1945 to June 30, 1946: $0.71111111; July 1, 1946, to Dec. 31, 1947: $0.905; 1948–49: $0.9050505.
[3] Yearly average weighted price of all grades of primary metal sold by producers. Price in 1945–47 includes bonus payments by Office of Metals Reserve for overquota production.

Mine production of gold, silver, copper, lead, and zinc in Oregon, 1945–49, and total, 1852–1949, in terms of recoverable metals

Year	Mines producing [1]		Ore, old tailings, etc. (short tons)	Gold (lode and placer)		Silver (lode and placer)	
	Lode	Placer		Fine ounces	Value	Fine ounces	Value
1945	9	10	1,378	4,467	$156,345	10,461	$7,439
1946	23	37	3,246	17,598	615,930	6,927	5,597
1947	20	49	3,277	18,979	664,265	30,379	27,493
1948	23	38	3,119	14,611	511,385	13,596	12,305
1949	28	29	6,215	16,226	567,910	12,195	11,037
1852–1949			(2)	5,741,368	128,910,923	5,281,482	4,845,270

Year	Copper		Lead		Zinc		Total value
	Short tons	Value	Short tons	Value	Short tons	Value	
1945	1	$270	1	$172	1	$230	$164,456
1946	7	2,268	2	436			624,231
1947	14	5,880	12	3,456	1	242	701,336
1948	2	868	7	2,506			527,064
1949	20	7,880	12	3,792	6	1,488	592,107
1852–1949	12,379	4,655,191	779	86,535	148	15,806	138,513,725

[1] Excludes itinerant prospectors, snipers, high-graders, and others who gave no evidence of legal right to property.
[2] Figure not available.

Gold.—Gold production in Oregon in 1949, including the fine-gold content of "natural gold" sold on the open market, increased 11 percent compared with 1948. Gold from placer mines, up 16 percent over 1948, was 89 percent of the State output; of the placer total, bucket-line dredges recovered 74 percent, dragline dredges 22 percent, hydraulicking 2 percent, and nonfloating washing plants (with mechanical excavators), drift mining, and small-scale hand methods together 2 percent. Lode gold decreased 16 percent compared with 1948, and 73 percent of the 1949 output was the yield from two mines. More than 99 percent of the lode gold produced was from dry gold ore and old tailings; the remainder was derived from dry silver ore and copper ore.

The following 5 producers, listed in order of output, supplied 87 percent of the State total: Baker Dredging Co. and Porter & Co. (bucket-line dredges); Calhoun & Howell of Oregon Ltd. (dragline

dredge); Buffalo Gold Dredging Co. (bucket-line dredge); and Bartels Bros. Mining Co., Champion mine (lode).

Monthly output for 1949—shown in the accompanying table—after winter operational curtailments reflects the fairly uniform yield from the major dredges augmented sporadically by output from other placer operations from April to December and from lode mines.

Gold produced at placer mines in Oregon, 1945–49, by classes of mines and by methods of recovery

Class and method	Mines producing [1]	Material treated (cubic yards)	Gold recovered		
			Fine ounces	Value	Average value per cubic yard
Surface placers:					
Gravel mechanically handled:					
Bucket-line dredges:					
1945	3	1,895,000	3,763	$131,705	$0.070
1946	4	5,116,000	13,793	482,755	.094
1947	2	[2] 3,976,500	[2] 12,164	[2] 425,740	[2] .107
1948	2	[2] 3,525,300	[2] 9,842	[2] 344,470	[2] .098
1949	3	3,468,900	10,744	376,040	.108
Dragline: [3]					
1945	--------	--------	--------	--------	--------
1946	9	252,000	1,910	66,850	.265

1949	29	4,157,300	14,465	506,275	.122

[1] Excludes itinerant prospectors, snipers, high-graders, and others who gave no evidence of legal right to property.
[2] Data for nonfloating washing plants included with bucket-line dredges to avoid disclosure of individual output.
[3] Includes all placer operations using dragline excavator for delivering gravel to floating washing plant.
[4] Includes all placer operations using suction pump for delivering gravel to floating washing plant, except those producing less than 100 ounces of gold, which are included with "small-scale hand methods."
[5] Includes all placer operations using power excavator and washing plant, both on dry land; when washing plant is movable, outfit is termed "dry-land dredge."
[6] Includes all operations in which hand labor is principal factor in delivering gravel to sluices, long toms, dip boxes, pans, etc.

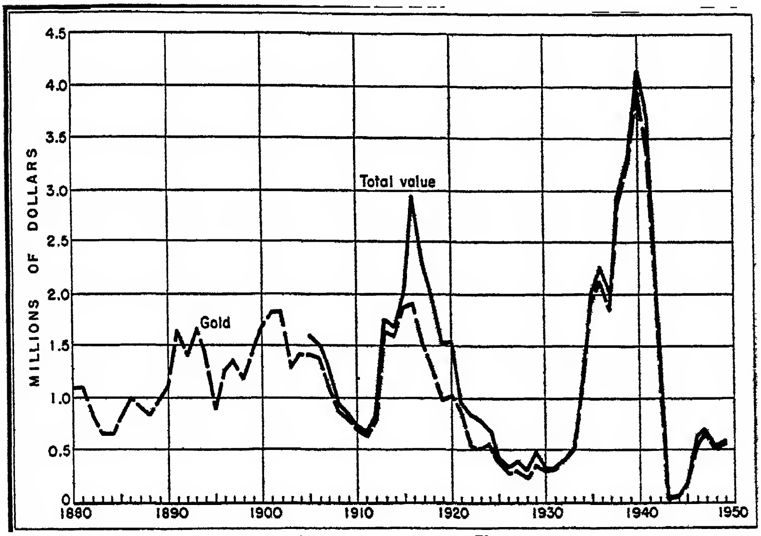

FIGURE 1.—Value of mine production in Oregon of gold, 1880–1949, and total value of gold, silver, copper lead, and zinc, 1905–49.

Mine production of gold and silver in Oregon in 1949, by months, in fine ounces of recoverable metal

Month	Gold	Silver	Month	Gold	Silver
January	303	272	August	2,198	2,075
February	247	43	September	1,509	1,920
March	862	181	October	1,701	2,052
April	1,552	296	November	1,653	946
May	1,406	246	December	1,441	1,266
June	2,011	716			
July	1,343	2,182	Total: 1949	16,226	12,195
			1948	14,611	13,596

Silver.—Oregon silver production in 1949 decreased 10 percent below the low level of 1948. More than 99 percent of the State total came from Grant, Lane, and Baker Counties; 74 percent was recovered from gold ore and old tailings, 22 percent from placer gravels, nearly 4 percent from silver ore, and less than 1 percent from copper ore.

Copper, Lead, and Zinc.—Renewal of mining and milling operations in the Bohemia district, Lane County, during 1949 accounted for the revival of zinc production—dormant since 1947—and most of the increase in Oregon copper and lead production over the almost negligible outputs of the two metals in 1948. The Champion mine (Bartels Bros. Mining Co.) was the principal producer of Oregon copper in 1949, whereas Helena Mines, Inc., operating the Helena and Musick mines, was the sole producer of zinc in Oregon and the leader in lead output.

MINE PRODUCTION BY COUNTIES

Mine production of gold, silver, copper, lead, and zinc in Oregon in 1949 by counties, in terms of recoverable metals

County	Mines producing [1]		Gold					
			Lode		Placer		Total	
	Lode	Placer	Fine ounces	Value	Fine ounces	Value	Fine ounces	Value
Baker	9	6	185	$6,475	5,774	$202,090	5,959	$208,565

Total: 1949	12,195	11,037	40,000	7,880	24,000	3,792	12,000	1,488	592,107
1948	13,596	12,305	4,000	868	14,000	2,506			527,064

[1] Excludes itinerant prospectors, snipers, high-graders, and others who gave no evidence of legal right to property.
[2] Combined to avoid disclosure of individual output.
[3] From property not classed as a mine.
[4] Sources of total silver as follows—1949: 9,488 ounces from lode mines and 2,707 from placers; 1948: 10,939 ounces from lode mines and 2,657 from placers.

MINING INDUSTRY

Although 28 Oregon lode mines reported production in 1949 compared with 23 mines in 1948 and 99 percent more ore and tailings were treated in 1949 than in the previous year, the value of gold, silver, copper, lead, and zinc produced at lode mines during 1949 declined $3,007 or 4 percent. Of the 6,215 tons of ore (including 472 tons of old tailings) treated in 1949, Lane County produced 65 percent, Grant County 17 percent, Baker County 14 percent, and Curry, Douglas, Jackson, Josephine and Wheeler Counties together 4 percent. Nearly 99 percent of the total (including all the old tailings) was dry gold ore and the remainder dry silver ore and copper ore.

The three properties worked by bucket-line dredge had one dredge each; one operated throughout the year and the others were idle at intervals during 1949. Three dragline dredges washed gravel during various periods of 1949, but only one operated at the close of the year. Twenty-three other placer mines were worked sporadically during 1949.

Ore and old tailings sold or treated in Oregon in 1949, with content in terms of recoverable metals

Source	Material sold or treated		Gold (fine ounces)	Silver (fine ounces)	Copper (pounds)	Lead (pounds)	Zinc (pounds)
	Ore (short tons)	Old tailings (short tons)					
Dry gold ore	5,650	472	1,758	9,035	33,900	24,000	12,000
Dry silver ore	47		1	431	300		
Copper ore	46		2	22	5,800		
Total lode mines	5,743	472	1,761	9,488	40,000	24,000	12,000
Placers			14,465	2,707			
Total: 1949	5,743	472	16,226	12,195	40,000	24,000	12,000
1948	3,103	16	14,611	13,596	4,000	14,000	

METALLURGICAL INDUSTRY

Of the State total ore and old tailings (6,215 tons), 87 percent was treated in mills and 13 percent was shipped crude to smelters. Ultimate recovery of nearly 47 percent of the total lode gold was from smelting of concentrates, nearly 38 percent was from the smelt ng of ore, 15 percent was as bullion from amalgamation of ore, and less than 1 percent from cyanidation of ore. Of the lode silver recovered, 63 percent was from concentrate smelted, 36 percent from ore and old tailings smelted, and 1 percent from ore amalgamated and cyanided. Smelting of concentrates accounted for 51 percent of the copper, 75 percent of the lead, and all the recoverable zinc, whereas 49 percent of the copper and 25 percent of the lead ore recovered was from direct smelting of ore. All material requiring smelting was shipped out of the State.

Mine production of metals in Oregon by methods of recovery, in 1949, in terms of recoverable metals

Method of recovery	Gold (fine ounces)	Silver (fine ounces)	Copper (pounds)	Lead (pounds)	Zinc (pounds)
Amalgamation	266	94

REVIEW BY COUNTIES AND DISTRICTS

BAKER COUNTY

Cracker Creek District.—Lloyd Anderson operated the Bald Mountain mine during 1949 recovering gold and silver by amalgamation. Some gold-silver concentrate produced from the gold ore was shipped to a smelter.

Rock Creek District.—John Arthur shipped 47 tons of fluxing ore containing 1 ounce of gold, 431 ounces of silver, and 365 pounds of copper to a smelter from the Chloride mine in 1949.

Sumpter District.—Baker Dredging Co., operated a Yuba-type electric bucket-line dredge at Sumpter Valley placers throughout 1949. Brockton-Nevada Mining Syndicate worked the former Harris property in Sumpter Valley by dragline dredge in 1949.

Upper Burnt River District.—Lloyd M. McCullough hydraulicked the Theresa K mine 14 miles west of Durkee, Oregon, from March 28 to December 1, 1949; 500 cubic yards of gravel washed yielded 26 ounces of gold and 3 ounces of silver.

Mine production of gold, silver, copper, lead, and zinc in Oregon in 1949, by counties and districts,[1] in terms of recoverable metals

[1] Only those counties and districts shown separately for which Bureau of Mines is at liberty to publish figures; other producing districts listed in footnote 7 and their output included with "Other districts."
[2] Excludes itinerant prospectors, snipers, high-graders, and others who gave no evidence of legal right to property.
[3] Source of silver: 9,488 ounces from lode mines and 2,707 ounces from placers.
[4] Greenhorn district is in Baker and Grant Counties.
[5] From property not classed as a mine.
[6] Included with "other districts."
[7] Includes Sumpter district in Baker County, Granite and North Fork districts in Grant County, and Spanish Gulch district in Wheeler County.

CURRY COUNTY

Chetco District.—W. D. Bowser amalgamated 65 tons of ore from the Bowser No. 1 and Robert E mines; 20 ounces of gold and 4 ounces of silver were recovered.

GRANT COUNTY

Canyon District.—Buffalo Gold Dredging Co. operated a Walter Johnson Diesel bucket-line dredge with eighty-four 6-cubic-foot buckets on the South Fork of John Day River in 1949; 1,499 ounces of gold and 138 ounces of silver were recovered from 567,986 cubic yards of gravel handled. Dredging operations ceased September 29, 1949.

Granite District.—Porter & Co. operated its Yuba-type electric bucket-line dredge with sixty 4½-cubic-foot buckets on Olive Creek from April 1 to December 20, 1949. The Buffalo mine, second largest producer of lode gold in Oregon in 1949, was worked by R. G. Amidon for the estate of Bruce Dennis throughout the year. Gold ore treated in a 30-ton flotation mill yielded concentrates, containing gold, silver, and some copper and lead, which were shipped to a smelter. Some small shipments of gold ore were made direct to smelters.

North Fork District.—Calhoun & Howell operated its Diesel dragline dredge on the North Fork of the John Day River during 1949.

JACKSON COUNTY

Gold Hill District.—George Tulare, operating the Sylvanite mine in 1949, amalgamated 11 tons of ore and recovered 5 ounces of gold and 1 ounce of silver.

JOSEPHINE COUNTY

Galice District.—Bert Pankey hydraulicked the Maloney mine from February 15 to April 15, 1949; 700 cubic yards of gravel washed yielded 5 ounces of gold.

Illinois River District.—Ben B. Baker and J. E. Hamlen operated the Onion Falls mine from May 1 to September 15, 1949; 46 tons of copper ore shipped to a smelter contained 2 ounces of gold, 22 ounces of silver, and 6,021 pounds of copper.

Waldo District.—Earle N. Young leased the Rainbow mine from July to December 1949 and recovered 3 ounces of gold and 1 ounce of silver from 7 tons of ore cyanided.

LANE COUNTY

Bohemia District.—Bartels Bros. Mining Co. operated the Champion mine and flotation mill during 1949. Copper concentrate (containing values in gold, silver, and lead) recovered from the gold ore milled was shipped to a smelter. In addition, gold ore was shipped for direct smelting. Helena Mines, Inc., and Harold Barton, lessee, worked the Helena mine from August to November 1949; 18 tons of zinc-lead concentrate, containing 15 ounces of gold, 102 ounces of silver, 888 pounds of copper, 2,863 pounds of lead, and 7,358 pounds of zinc produced from 130 tons of gold ore milled at the Champion mine and 34 tons of gold ore containing 20 ounces of gold, 68 ounces of silver, 1,173 pounds of copper, 1,978 pounds of lead, and 1,500 pounds of zinc, were shipped to smelters. Helena Mines, Inc., leasing the Musick mine from the Tar Baby Mining Co., shipped 485 tons of dump ore to the Champion mill during 1949. The zinc-lead concentrate produced (28 tons containing 25 ounces of gold, 145 ounces of silver, 1,163 pounds of copper, 5,258 pounds of lead, and 8,632 pounds of zinc) was shipped to a smelter. Data on mines and prospects in this district were published.[1]

MALHEUR COUNTY

Mormon Basin District.—Frank E. Deem recovered 5 ounces of gold and 1 ounce of silver by ground-sluicing and dry-washing 75 cubic yards of gravel at the Bam Tree group of claims in 1949.

South Dakota
Gold, Silver, Copper, Lead, and Zinc

(MINE REPORT)

By A. J. Martin

GENERAL SUMMARY

GOLD mining is the principal mineral industry of South Dakota. The mines are in a small area comprising parts of Lawrence, Pennington, and Custer Counties in the Black Hills. The Homestake mine at Lead, Lawrence County, is the largest gold-producing mine in the United States. Silver is recovered regularly as a byproduct of gold mining. Some copper and lead are produced occasionally, and zinc-lead ore was produced by one mine in several of the years since 1942.

The State output of gold in 1949 increased 19 percent over 1948. Production from the Homestake mine during the last 6 months of 1949 reached the highest rate of the postwar period. Since the mine resumed operations after the wartime shut-down, it has not operated a full year at normal productive capacity because of the limited number of men available for underground work. Output from the Bald Mountain mine at Trojan, an important gold producer, was a little higher than in 1948.

Production of gold and silver by other South Dakota properties was small. The lead credited to the output in 1949 was contained in lead-gold-silver concentrate produced in 1948 at the Belle Eldridge mine but not shipped until 1949.

All tonnage figures are short tons and "dry weight"; that is, they do not include moisture.

The value of the metal production reported herein has been calculated at the following prices.

Prices of gold, silver, copper, lead, and zinc, 1945–49

Year	Gold [1] (per fine ounce)	Silver [2] (per fine ounce)	Copper [3] (per pound)	Lead [3] (per pound)	Zinc [3] (per pound)
1945	$35.00	$0.711+	$0.135	$0.086	$0.115
1946	35.00	.808	.162	.109	.122
1947	35.00	.905	.210	.144	.121
1948	35.00	.905+	.217	.179	.133
1949	35.00	.905+	.197	.158	.124

[1] Price under authority of Gold Reserve Act of Jan. 31, 1934. Treasury legal coinage value of gold from Jan. 18, 1837, to Jan. 31, 1934, was $20.67+($20.671835) per fine ounce.
[2] Treasury buying price for newly mined silver. 1945 to June 30, 1946: $0.71111111; July 1, 1946, to Dec. 31, 1947: $0.905; 1948–49: $0.9050505.
[3] Yearly average weighted price of all grades of primary metal sold by producers. Price in 1945–47 includes bonus payments by Office of Metals Reserve for overquota production.

Mine production of gold, silver, copper, lead, and zinc in South Dakota, 1945–49, and total, 1876–1949, in terms of recoverable metals [1]

Year	Mines producing: Lode	Mines producing: Placer	Ore (short tons)	Gold (lode and placer): Fine ounces	Gold (lode and placer): Value	Silver (lode and placer): Fine ounces	Silver (lode and placer): Value
1945	3		312,612	55,948	$1,958,180	26,564	$18,890
1946	5		872,242	312,247	10,928,645	86,901	70,216
1947	4		939,384	407,194	14,251,790	111,684	101,074

1948	377,850	94,693	16	29

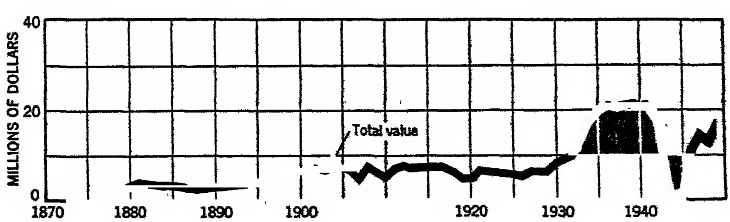

FIGURE 1.—Total value of mine production of gold and silver in South Dakota, 1876–1949

MINE PRODUCTION BY COUNTIES

The entire South Dakota output of gold, silver, and lead in 1949 came from Lawrence County. The production figures for this county are therefore the same as those shown for 1949 in the foregoing State tables. In 1948 all the State output came from Lawrence County except 14 ounces of gold from Pennington County. Custer County has had no production of gold or silver since 1941.

MINING AND METALLURGIC INDUSTRY

Details of mining and milling in South Dakota are given in the following Review by Counties. A break-down of ore-treatment methods shows that 1,112,183 tons of ore, yielding 447,071 ounces of gold and 83,528 ounces of silver, were treated by amalgamation followed by cyanidation of sands and slimes; 117,979 tons, yielding 17,555 ounces of gold and 25,632 ounces of silver, were treated by cyanidation only; and 10 tons, yielding 10 ounces of silver, were treated by amalgamation only. Sixteen tons of lead concentrate derived from zinc-lead ore milled and recorded in 1948 were shipped in 1949; the yield, in terms of recoverable metals, was 23 ounces of gold, 213 ounces of silver, and 4 tons of lead. One ounce of gold was recovered by placering.

Gold and silver bullion produced at mills in South Dakota by amalgamation, 1945–49

Year	Ore treated (short tons)	Gold in bullion (fine ounces)	Silver in bullion (fine ounces)	Quicksilver used (pounds)
1945	298,830	35,398	7,254	1,500
1946	793,034	197,425	35,498	(1)
1947	849,123	262,257	52,057	(1)
1948	896,932	250,782	72,100	(1)
1949	1,112,193	312,676	83,538	(1)

REVIEW BY COUNTIES

LAWRENCE COUNTY

Homestake Mine.—The Homestake mine operated continuously in 1949. Ore milled averaged 3,047 tons daily, 7 days a week, compared with 2,450 tons in 1948. The rated capacity of the mills is 4,000 tons. More men became available for underground work during 1949, and production in the latter half of the year showed a large increase over the first half. The mine is opened by three vertical shafts, the deepest being 4,245 feet, and an inside winze to the 5,000-foot level. Development during the year included 24,979 feet of drifts, 12,436 feet of raises, and 32,882 feet of diamond drilling. The primary crushing plants are at the hoists. Other surface plants include the 180-stamp South mill (the main secondary crushing, grinding, and amalgamating plant), cyanide sand plant No. 1, cyanide sand plant No. 3, and the refinery—all at Lead—and the slime plant at Deadwood. At the refinery silver is parted from the gold, and virtually pure metals are shipped to the Denver Mint. The following data are extracted from the annual report of the general manager of the Homestake Mining Co. for the year ended December 31, 1949:

Ore mined in 1949 was 1,112,183 tons, which compared with 896,862 tons in 1948. Bullion with value of $15,683,159.05 was produced, which is $3,025,020.50 more than in 1948. Average realization was $14.10 per ton and metallurgical recovery was 96.98 percent, the highest recovery ever achieved by the company. Increased production resulted directly from increase in the number of men available for underground work. The average number employed in the mine department during 1949 was 264 more than in 1948. On December 31, the mine department had 286 more employees than at the end of 1948. The full number of men required for the mine department was nearly reached in mid-November and since that time there was a slight increase only. * * * It is expected that output of ore will continue to increase to approach prewar production of 1,400,000 tons per year.

Following record snowfall in November 1948, the new year began with the most severe storm in the history of the Black Hills. Roads and railways were completely blocked for extended periods. Only one coal shipment was received at the company's Kirk power station in 3 weeks. The first carload shipment of supplies to be received in 1949 was delivered to our plant on February 8. This resulted in some curtailment in milling and in production from the sawmill because of shortage of power, and also increased cost for snow removal.

Operating expense per ton, exclusive of taxes and contribution to the Pension Trust, was 3.89 percent higher than in 1948 because of higher average wages, cost of supplies, and freight charges. Such expense was 62.6 percent higher than in 1941. With inclusion of the Pension Trust cost such expense was 9.04 percent higher than in 1948 and 70.7 percent higher than in 1941.

Broken ore in shrinkage stopes increased from 340,000 tons on December 31, 1948, to 461,000 tons at the end of 1949. The reserve of developed ore, including the broken ore, is 21,024,000 tons as compared with 21,454,000 tons at the end of 1948.

The mine and plant are in excellent condition. There were no interruptions of operations during the year, except that caused by the January storm.

Ore milled, receipts, and dividends, Homestake mine, 1945–49 [1]

Year	Ore milled (short tons)	Receipts for bullion product		Dividends
		Total	Per ton	
1945	298,828	$1,873,872.64	$6.2707	
1946	792,094	10,458,896.22	13.1891	$2,812,992
1947	849,023	13,796,720.25	16.2501	4,018,560
1948	896,862	12,658,138.55	14.1138	4,018,560
1949	1,112,183	15,683,159.05	14.1012	4,520,880

[1] From 1876 to 1949, inclusive, this mine yielded bullion and concentrates that brought a net return of $494,113,151 and paid $165,176,794 in dividends.

Other Mines.—The Bald Mountain Mining Co. operated its 370-ton mill at Trojan three shifts a day, 7 days a week throughout 1949. Ore milled averaged 323 tons daily compared with 291 tons in 1948. The company group of mines includes the Portland, Dakota, Clinton, Two Johns, Trojan, and other claims. Mine development during 1949 comprised 3,540 feet of drifts and crosscuts and 600 feet of raises. The ore-treatment process includes crushing to ⅝-inch size, ball milling in cyanide solution, thickening and agitation, countercurrent washing in four stages, Merrill-Crowe zinc-dust precipitation, and reduction of precipitate in a gas-fired reverberatory-type tilting furnace. Sulfide ores, when available, are bypassed from the crushing circuit, dry-rod-milled to 10-mesh, roasted, and returned to the ball mills. Gold recovered in 1949 totaled 17,544 ounces and silver 25,612 ounces.

The Frerichs Mining Co. recovered some gold and silver from ore milled at the Frerichs mine during January and February to test the mill equipment after changes had been made in the flow sheet. The Belle Eldridge mine was not worked in 1949, but 16 tons of lead-gold-silver concentrate produced in milling zinc-lead ore in 1948 were shipped in 1949. Some silver was recovered by amalgamating old tailings on the Branch Mint millsite, and 1 ounce of gold was produced by sluicing on Wildwood Creek.

Texas

Gold, Silver, Copper, Lead, and Zinc

(MINE REPORT)

By A. J. Martin

GENERAL SUMMARY

THE MINE output of gold, silver, copper, and lead in Texas in 1949 was valued altogether at $55,003 compared with $75,611 in 1948. Four small-scale operations in Culberson, Hudspeth, and Presidio Counties in the western part of the State contributed to the production in 1949. Lead represented 76 percent of the total value in 1949 and 80 percent in 1948.

No output of zinc was reported from newly mined Texas ore in 1948 or 1949. Some of the old zinc-bearing slag accumulated in earlier years at the El Paso Smelting Works of the American Smelting & Refining Co. was re-treated along with current hot slag in the company slag-fuming plant put in operation in 1948. In the mine-production statistics the metals (principally zinc) recovered from domestic current hot slag are credited to the various shipping mines on the basis of the assay content of the ore and are thus apportioned to the States from which they came. Specific data on the quantity of metals recovered from the old slag accumulated before 1948 are not available, and this output is not included in the mine-production statistics.

All tonnage figures are short tons and "dry weight"; that is, they do not include moisture.

The value of the metal production reported herein has been calculated at the following prices.

Prices of gold, silver, copper, lead, and zinc, 1945–49

Year	Gold[1] (per fine ounce)	Silver[2] (per fine ounce)	Copper[3] (per pound)	Lead[3] (per pound)	Zinc[3] (per pound)
1945	$35.00	$0.711+	$0.135	$0.086	$0.115
1946	35.00	.808	.162	.109	.122
1947	35.00	.905	.210	.144	.121
1948	35.00	.905+	.217	.179	.133
1949	35.00	.905+	.197	.158	.124

[1] Price under authority of Gold Reserve Act of Jan. 31, 1934. Treasury legal coinage value of gold from Jan. 18, 1837, to Jan. 31, 1934, was $20.67+ ($20.671835) per fine ounce.
[2] Treasury buying price for newly mined silver. 1945 to June 30, 1946: $0.71111111; July 1, 1946, to Dec. 31, 1947: $0.905; 1948–49: $0.9050505.
[3] Yearly average weighted price of all grades of primary metal sold by producers. Price in 1945–47 includes bonus payments by Office of Metals Reserve for overquota production.

MINE PRODUCTION

In total mine production from 1885 through 1949, silver was the principal metal produced in Texas, although the output has been small since large-scale operation of the Presidio mine at Shafter ceased in 1942. The following table shows the annual output of ore and the quantity and value of the metals recovered from Texas mines from 1945 to 1949, as well as the total metal production from 1885 to 1949.

Mine production of gold, silver, copper, lead, and zinc in Texas, 1945–49, and total, 1885–1949, in terms of recoverable metals

Year	Ore (short tons)	Gold		Silver	
		Fine ounces	Value	Fine ounces	Value
1945	2,693			23,265	$16,544
1946	6,705	9	$315	42,922	34,681
1947	4,552	45	1,575	20,547	18,595
1948	1,850	57	1,995	3,065	2,774
1949	2,140	40	1,400	2,691	2,435
1885–1949	[1]	8,432	229,065	33,294,666	23,438,865

Year	Copper		Lead		Zinc		Total value
	Short tons	Value	Short tons	Value	Short tons	Value	
1945	55	$14,850					$31,394
1946	3	972	47	$10,246	44	$10,736	56,950
1947	6	2,520	78	22,464	22	5,324	50,478
1948 [2]	23	9,982	170	60,860			75,611
1949 [2]	24	9,456	132	41,712			55,003
1885–1949	1,362	392,001	5,215	624,731	810	122,551	24,807,213

[1] Figure not available.
[2] Does not include zinc and lead that were recovered by the slag-fuming plant at the El Paso smelter from old accumulated slag resulting from operations in previous years.

Mine production of gold, silver, copper, and lead in Texas in 1949, by counties, in terms of recoverable metals

County	Mines producing	Ore (short tons)	Gold (fine ounces)	Silver (fine ounces)	Copper (short tons)	Lead (short tons)
Culberson	1	22		54	1	1
Hudspeth	1	1,227		27	22	
Presidio	2	891	40	2,610	1	131
Total: 1949	4	2,140	40	2,691	24	132
1948	5	1,850	57	3,065	23	170

Mine production of gold, silver, copper, and lead in Texas in 1949, by months, in terms of recoverable metals

Month	Gold (fine ounces)	Silver (fine ounces)	Copper (short tons)	Lead (short tons)
January	3	191	3	7
February	6	414	6	29
March	2	244	4	16
April	5	378	6	16

1948	57	3,065	23	170

ORE CLASSIFICATION

Details of ore classification are given in the Gold and Silver chapter of this volume.

Ore sold or treated in Texas in 1949, with content in terms of recoverable metals

Source	Mines producing	Ore (short tons)	Gold (fine ounces)	Silver (fine ounces)	Copper (short tons)	Lead (short tons)
Copper ore	2	1,249		81	23	1
Lead ore	2	891	40	2,610	1	131
Total: 1949	4	2,140	40	2,691	24	132
1948	5	1,850	57	3,065	23	170

METALLURGIC INDUSTRY

Smelters in Texas treat large tonnages of ore, concentrates, and fume from the various mining States and foreign countries, as well as substantial tonnages of smelter residues and secondary material from plants in Texas and other States east of the Rocky Mountain region.

The El Paso Smelting Works of the American Smelting & Refining Co. includes a copper and a lead smelter—each with an annual rated capacity in 1949 of 300,000 tons of ore and concentrates—and a slag-fuming plant for recovering zinc. Ores and concentrates received in 1949 came from mines in Arizona, Colorado, Missouri, New Mexico, Texas, Central America, Mexico, South-West Africa, Tasmania, Arabia, and Cuba. Other material treated included zinc-smelter residues, matte, and clean-up material from plants in various States and foreign countries.

The Phelps Dodge Corp. Nichols electrolytic copper refinery at El Paso treats blister-copper anodes cast at corporation smelters in Arizona. The plant employs about 800 men and operated continuously in 1949. It has a capacity of 240,000 tons of electrolytic copper annually and in addition produces some fire-refined copper. A copper sulfate (blue vitriol) section and a slime plant (for recovery of rare metals and gold, silver, and lead) are operated in connection with the electrolytic plant.

There are three zinc-reduction plants in Texas, all of which were active throughout 1949. The horizontal-retort smelter of the American Smelting & Refining Co. at Amarillo has an annual rated capacity of 56,500 tons of metal; in 1949 it received concentrates from mines in Arizona, California, Colorado, Montana, New Mexico, Nevada, and Utah and fume from Texas. The same company operates the electrolytic zinc plant at Corpus Christi. This plant has an annual capacity of approximately 34,000 tons of slab zinc and treats mostly foreign concentrates.

The horizontal-retort smelter of the American Zinc Co. of Illinois at Dumas can produce 48,000 tons of zinc metal annually. In 1949 it received concentrates from mines in Arizona and New Mexico, and zinc fume from slag-fuming plants in Utah and Idaho; the plant also treated a considerable tonnage of concentrates from foreign countries.

REVIEW BY COUNTIES

Culberson County.—J. J. Trepanier carried on development work in his Mary Ellen mine in the Diablo mountains 25 miles north of Van Horn from May to October 1949 and shipped 22 tons of copper-lead-silver ore to the El Paso smelter. The development included 82 feet of shaft and 86 feet of drifts.

Hudspeth County.—Copper ore was shipped from the Sancho Panza mine 7 miles northeast of Allamoore, operated several months in 1949 by A. P. Williams.

Presidio County.—R. I. Carr shipped lead ore from his leased properties 7 miles west of Shafter to the El Paso smelter. The results of investigations of these and adjacent properties by the Bureau of Mines were published.[1] The ore shipped in 1949 contained, besides lead, some silver and a little gold and copper. Several cars of lead-silver ore were shipped from the Silver Dome group 25 miles northwest of Presidio.

Utah

Gold, Silver, Copper, Lead, and Zinc

(MINE REPORT)

By C. E. Needham and Paul Luff

GENERAL SUMMARY

METAL mining in Utah in 1949 was erratic, and during much of the year it lacked the stimuli for outstanding production. Compared with 1948, yield of gold declined 15 percent, silver 16, copper 13, lead 5, and zinc 2; ore output dropped nearly 15 percent. Declines in the production of the five metals in 1949, coupled with lower average prices for base metals, brought about a 15-percent decrease in the value for gold, 16 for silver, 21 for copper, 16 for lead, and 9 for zinc. The value of the five metals in 1949 was $121,649,828, or 19 percent less than the value of $149,763,677 in 1948. Nevertheless the 1949 total was the fourth highest in the State's history and only 23 percent below the all-time record of $158,624,849 established in 1947. Of the total value in 1949, copper contributed 64 percent, lead 14, gold 9, zinc 8, and silver 5. Compared with 1948, the value of the metal production decreased 18 percent in the West Mountain (Bingham) district, and 32 in the Park City region, but only 2 in the Tintic district.

All tonnage figures are short tons and "dry weight"; that is, they do not include moisture.

The value of metal production reported herein has been calculated at the following prices.

Prices of gold, silver, copper, lead, and zinc, 1945–49

Year	Gold [1] (per fine ounce)	Silver [2] (per fine ounce)	Copper [3] (per pound)	Lead [3] (per pound)	Zinc [3] (per pound)
1945	$35.00	$0.711+	$0.135	$0.086	$0.115
1946	35.00	.808	.162	.109	.122
1947	35.00	.905	.210	.144	.121
1948	35.00	.905+	.217	.179	.133
1949	35.00	.905+	.197	.158	.124

[1] Price under authority of Gold Reserve Act of Jan. 31, 1934. Treasury legal coinage value of gold from Jan. 18, 1837, to Jan. 31, 1934, was $20.67+ ($20.671835) per fine ounce.

[2] Treasury buying price for newly mined silver. 1945 to June 30, 1946: $0.71111111; July 1, 1946, to Dec. 31, 1947: $0.905; 1948–49; $0.9050505.

[1] Figures estimated for certain years before 1901.

Mine production of gold, silver, copper, lead, and zinc in Utah in 1949, by months, in terms of recoverable metals

Month	Gold (fine ounces)	Silver (fine ounces)	Copper (short tons)	Lead (short tons)	Zinc (short tons)
January	3,085	272,455	120	3,480	3,005
February	15,240	368,485	7,650	3,080	2,570
March	32,968	692,055	20,730	5,510	4,515
April	33,115	694,445	20,200	5,630	4,610
May	30,305	675,650	18,380	5,640	4,125
June	28,075	658,321	18,110	5,385	4,210
July	25,940	545,055	17,545	3,555	2,445
August	25,850	555,205	18,455	3,680	2,505
September	29,075	587,524	17,265	4,260	2,995
October	27,200	509,365	17,910	3,720	2,760
November	31,420	577,215	20,320	4,350	3,270
December	31,785	589,105	20,560	4,782	3,660
Total: 1949	314,058	6,724,880	197,245	53,072	40,670
1948	368,422	8,045,329	227,007	55,950	41,490

Gold.—Of the larger gold-producing properties in Utah in 1949, only the property of the Park Utah Consolidated Mines Co. in the Park City region reported a gain over 1948 output. Loss was especially large at the Utah Copper mine in Bingham Canyon, owing to the work stoppage which began in 1948 and continued until early February 1949.

Of the total gold in 1949, 85 percent came from copper ore, 12 from zinc-lead ore, 0.3 from other base-metal ores, and nearly 3 from gold and silver ores. Two placers reported production. The West Mountain (Bingham) district supplied 91 percent of the total, the Park City region 6, and the Tintic district nearly 2 precent. Output of the metal in the West Mountain (Bingham) district was 14 percent below that

in 1948 and in the Tintic district 53 percent, but in the Park City region it rose 2 percent.

The leading gold producers in Utah in 1949—each with an output of more than 1,000 ounces of recoverable metal—were as follows: Utah Copper mine and the United States & Lark group, both in the West Mountain (Bingham) district; the properties of the New Park Mining Co. and Park Utah Consolidated Mines Co., both in the Park City region; Eureka Lilly mine and the Chief Consolidated Mining Co. property, both in the Tintic district; Butterfield property in the West Mountain (Bingham) district; and the Calumet mine in the Rush Valley district. These eight properties furnished 98 percent of the State gold.

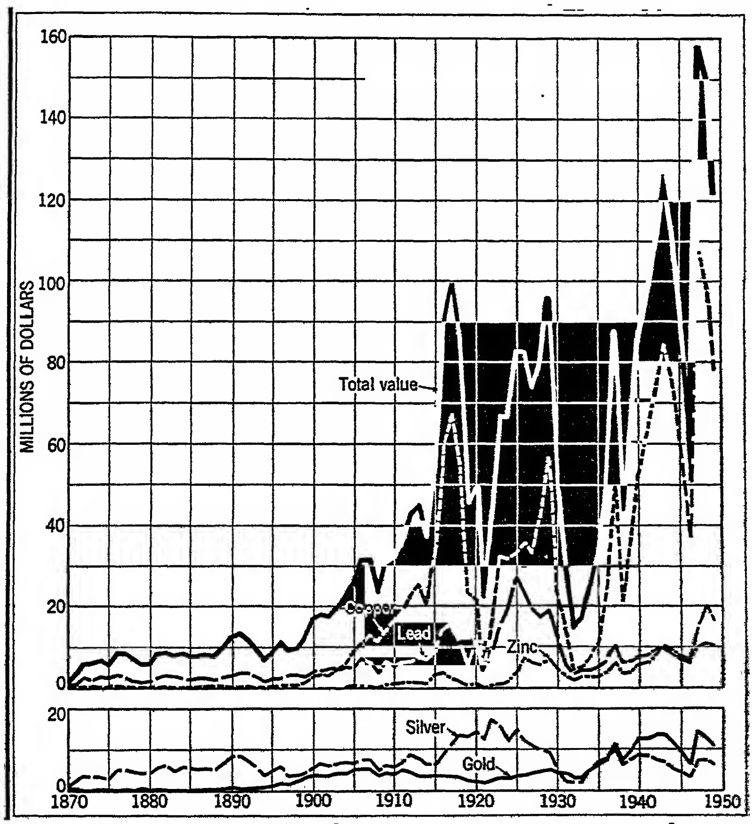

FIGURE 1.—Value of mine production of gold, silver, copper, lead, and zinc, and total value in Utah, 1870–1949.

Silver.—With the exception of the Butterfield property in the West Mountain (Bingham) district and the Daly No. 1 dump at Park City, all of the larger producers of silver in Utah reported smaller outputs in 1949 than in 1948. Decreases were especially notable at the Utah Copper mine and at the properties of the Park Utah Consolidated

Mines Co. and Silver King Coalition Mines Co. Yield of the metal dropped 8 percent in the West Mountain (Bingham) district, 38 in the Park City region, and 19 in the Tintic district.

Utah properties that produced more than 100,000 ounces of recoverable silver each in 1949 were as follows: Utah Copper mine, United State & Lark group, properties of Chief Consolidated Mining Co. and New Park Mining Co., Butterfield group, Park Utah Consolidated Mines Co. property, Daly No. 1 dump, Calumet mine, and Silver King Coalition Mines Co. property. These nine producers contributed 92 percent of the State silver.

Zinc-lead ore, zinc ore, lead ore, and zinc-lead-copper ore together furnished almost 57 percent of the State silver in 1949, copper ore 33 percent, and gold and silver ores 10 percent; the remainder came principally from zinc slag fumed.

Copper.—The Utah Copper mine in Bingham Canyon, Utah's only outstanding copper mine, experienced a work stoppage from October 24, 1948, to February 7, 1949. The loss from that part of the shutdown in 1949 is estimated to have been more than 60,000,000 pounds of recoverable copper, and that from the 1948 period 100,000,000 pounds. On June 1, the mine changed its workweek from 48 to 40 hours, which schedule was followed until Christmas. The effect of the strike and the shortened workweek was to reduce the output of copper at the mine about 13 percent below that in 1948. The United States & Lark group increased its copper output nearly 13 percent and was the only other Utah property to produce more than a million pounds of recoverable copper in 1949. These two producers contributed over 99 percent of the State copper.

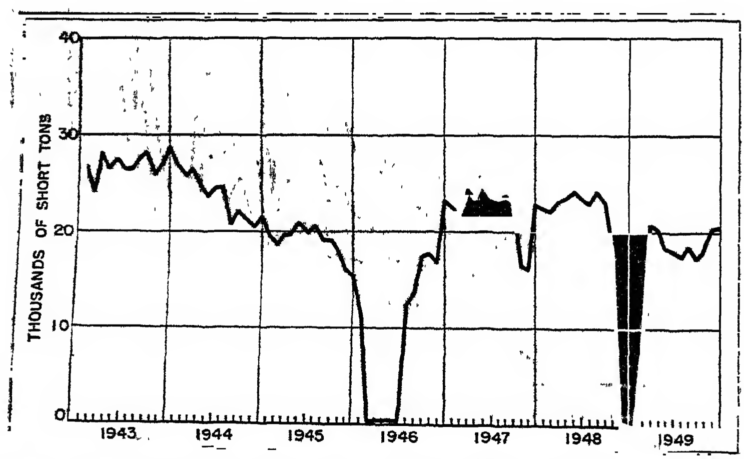

FIGURE 2.—Mine production of copper in Utah, by months, 1943-49, in terms of recoverable metal.

Lead.—Because of a reduced workweek early in May, followed by stoppages late in June at three of the large lead producers and serious curtailment at the fourth in the Park City region, output of lead in 1949 declined substantially at the properties of the New Park Mining Co., Park Utah Consolidated Mines Co., Silver King Coalition Mines Co., and Pacific Bridge Co. Production of the metal for the year also declined at the Calumet mine in the Rush Valley district. These losses were compensated in part by increases in lead yield from the United States & Lark group, Chief Consolidated Mining Co. property, Butterfield group, Cardiff mine, and the Hidden Treasure mine, and the return to production of the New Park Mining Co. property on September 15.

The leading State lead producers in 1949, each with an output of more than a million pounds of recoverable lead, were the United States & Lark group, properties of the Chief Consolidated Mining Co. and Park Utah Consolidated Mines Co., Butterfield group, Calumet mine, properties of New Park Mining Co. and Silver King Coalition Mines Co., Hidden Treasure mine (Ophir district), Pacific Bridge Co. property, and the Cardiff mine (Big Cottonwood district). These 10 producers supplied 94 percent of the State lead.

Of the total lead in 1949, 92 percent was recovered from zinc-lead ore and most of the remainder from lead ore, gold and silver ores, and zinc slag.

Zinc.—Although zinc made a better showing in Utah in 1949 than lead, the factors bringing about a decline in lead production in the Park City region also forced a decline in zinc output, and decreases were marked at the properties of the Silver King Coalition Mines Co., New Park Mining Co., and Pacific Bridge Co. Park Utah Consolidated Mines Co. reversed the district trend and reported an increase for the year at its property. The large gain at the property of the Chief Consolidated Mining Co. was chiefly responsible for the 65-percent increase in zinc output in the Tintic district. The Butterfield group and Hidden Treasure mine also had greater production of the metal than in 1948. The Calumet mine and the Tooele old slag pile failed to equal their 1948 figures.

Leading zinc producers in 1949, each with an output of more than a million pounds of recoverable metal, were the United States & Lark group, properties of the Chief Consolidated Mining Co., Park Utah Consolidated Mines Co., and New Park Mining Co., Butterfield group, Calumet mine, Tooele old slag pile, Hidden Treasure mine, Pacific Bridge Co. property, and Silver King Coalition mine. These 10 properties furnished about 97 percent of the State total zinc.

Zinc-lead ore was the source of 97 percent of the total zinc in 1949; old zinc slag furnished most of the remainder.

MINE PRODUCTION BY COUNTIES

Mine production of gold, silver, copper, lead, and zinc in Utah in 1949, by counties, in terms of recoverable metals

County	Mines producing		Ore (short tons)	Gold		Silver

MINING INDUSTRY

The declines in the production of ore (15 percent) and in all five metals in Utah in 1949 were attributable to two main factors: The labor strike at the Utah Copper mine, beginning in October 1948 and in effect until February 7, 1949, and the sharp drop in base-metal prices, beginning in March and continuing well into summer. Unstable markets for base metals not only resulted in closing a number of mines but in curtailing production at others through cutbacks in labor force or through a reduction of the workweek from 48 to 40 hours. Of the 10 leading State producers in point of tonnage, only the Chief Consolidated Mining Co. property, Butterfield group, United States & Lark group, and Daly No. 1 dump reported more ore sold or treated in 1949 than in 1948, whereas declines were pronounced at the Utah Copper mine, Calumet mine, and properties of the Park Utah Consolidated Mines Co., Silver King Coalition Mines Co., New Park Mining Co., and Pacific Bridge Co.

Active lode mines in the State dropped 21 percent from 118 in 1948 to 93 in 1949; the number of active placers (2) was unchanged.

ORE CLASSIFICATION

Details of ore classification are given in the Gold and Silver chapter of this volume.

Ore sold or treated in Utah in 1949, with content in terms of recoverable metals

Source	Mines producing	Ore (short tons)	Gold (fine ounces)	Silver (fine ounces)	Copper (pounds)	Lead (pounds)	Zinc (pounds)
Dry gold ore	5	4,726	1,531	4,509	34,595	51,793	3,792
Dry gold-silver ore	16	93,035	5,541	260,093	585,096	2,937,414	2,113
Dry silver ore	19	73,874	1,576	398,558	203,620	1,701,556	----------
	40	171,635	8,648	663,160	823,311	4,690,763	5,905
Copper	13	20,924,274	267,891	2,233,708	[1] 390,243,978	32,075	----------
Lead	39	20,304	907	114,120	60,759	2,853,437	155,700
Zinc	3	[2] 33,705	88	12,061	106,632	514,590	2,167,606
Zinc-lead	38	842,441	36,442	3,677,733	3,195,053	97,861,774	78,833,330
Zinc-lead-copper	3	1,108	70	24,098	60,267	191,361	177,459
Total lode mines	[3] 93	21,993,467	314,046	6,724,880	[1] 394,490,000	106,144,000	81,340,000
Placers	2	----------	12	----------	----------	----------	----------
Total: 1949	95	21,993,467	314,058	6,724,880	[1] 394,490,000	106,144,000	81,340,000
1948	120	25,741,911	368,422	8,045,329	[4] 454,014,000	111,900,000	82,980,000

[1] Includes 15,822,418 pounds recovered from mine-water precipitates.
[2] Includes 17,480 tons of zinc slag.
[3] A mine producing more than 1 class of ore is counted but once in arriving at total for all classes.
[4] Includes 15,658,743 pounds recovered from mine-water precipitates.

METALLURGIC INDUSTRY

The 21,993,467 tons of ore produced in Utah in 1949 were treated as follows: 21,811,661 tons (99 percent) at mills (25,517,522 tons in 1948); 164,326 tons (less than 1 percent) shipped crude to smelters (189,571 tons in 1948); and 17,480 tons of old slag fumed (34,818 tons in 1948).

The 10 mills active in Utah in 1949 treated Utah ore and tailings as follows: Three plants (Arthur, Magna, and Prosper), 20,922,420 tons of copper ore; six mills (Bauer, Midvale, Pacific Bridge, Silver King, Tooele, and Horn Silver), 849,241 tons of zinc-lead ore and old tailings, zinc-lead-copper ore, and lead ore; one plant (Bauer), 24,000 tons of old pyritic gold-silver tailings; and one flotation mill in Summit County, 16,000 tons of current zinc tailings.

The Midvale 1,700-ton concentrator of the United States Smelting Refining & Mining Co. operated all year and continued to treat largely zinc-lead ore, most of which came from company-owned properties in the West Mountain (Bingham) district and from the property of the New Park Mining Co. in the Park City region. The 1,500-ton concentrator of the International Smelting & Refining Co. at Tooele operated mainly on zinc-lead ore supplied by Chief Consolidated Mining Co. in the Tintic district and the Park Utah Consolidated Mines Co. in the Park City region; the copper unit at the concentrator remained idle. The 700-ton concentrator of the Combined Metals Reduction Co. at Bauer operated throughout 1949, largely on zinc-lead ore supplied by company owned or operated mines in Utah and Idaho and by the Chief Consolidated Mining Co. The 800-ton

concentrator of the Silver King Coalition Mines Co. at Park City operated until the company mine closed on July 1; only company zinc-lead ore was treated. The tailing plant of the Pacific Bridge Co. at Park City closed on May 6, following a sharp decline in the prices of lead and zinc.

The Garfield copper smelter of the American Smelting & Refining Co. reopened shortly after the Utah Copper mine returned to production on February 7 and operated during the remainder of 1949. The Murray lead smelter of the American Smelting & Refining Co. closed indefinitely in October because of an inadequate supply of ores and concentrates. The Midvale lead smelter of the United States Smelting, Refining & Mining Co. operated all year and treated lead concentrates, lead ores, and gold and silver ores, chiefly from company-owned properties in Utah. The Tooele lead plant of the International Smelting & Refining Co. operated all year in conjunction with the company zinc slag-fuming plant and treated zinc-lead ores, lead ores and concentrates, and zinc ores and old slag from both company and custom sources. The slag-fuming plant treated a total of 107,774 tons of current hot slag, old cold slag, and crude ore in 1949, compared with 127,550 tons in 1948; output in 1949 was 18,622 tons of zinc fume, averaging 76.23 percent zinc, and 2,757 tons of lead fume, averaging 47.76 percent lead. The company copper smelter at Tooele remained idle all of 1949.

Work was pushed rapidly on construction of the $16,000,000 copper refinery of the Kennecott Copper Corp. and the copper-anode plant of the American Smelting & Refining Co., both at Garfield.

Mine production of metals in Utah in 1949, by methods of recovery, in terms of recoverable metals

Method of recovery	Gold (fine ounces)	Silver (fine ounces)	Copper (pounds)	Lead (pounds)	Zinc (pounds)
Concentrates smelted	305,047	5,894,423	377,134,931	96,895,957	77,884,012
Ore smelted [1]	8,999	830,457	1,532,651	9,248,043	3,455,988
Mine-water precipitates smelted [2]	-------	-------	15,822,418	-------	-------
Total lode	314,046	6,724,880	394,490,000	106,144,000	81,340,000
Placer	12	-------	-------	-------	-------
Total: 1949	314,058	6,724,880	394,490,000	106,144,000	81,340,000
1948	368,422	8,045,329	454,014,000	111,900,000	82,980,000

[1] Includes 17,480 tons of old slag.
[2] All from Salt Lake County.

Gross metal content of Utah ore treated at mills in 1949, by classes of ore [1]

Class of ore	Ore (short tons)	Gross metal content of mill feed				
		Gold (fine ounces)	Silver (fine ounces)	Copper (pounds)	Lead (pounds)	Zinc (pounds)
Dry gold-silver ore	24,000	1,075	32,000	-------	515,000	-------

REVIEW BY COUNTIES AND DISTRICTS

BEAVER COUNTY

Beaver Lake District.—Penn-Utah Mining Co. operated the O. K. mine from May to December 1949 and shipped 158 tons of copper smelting ore containing 4 ounces of gold, 251 ounces of silver, and 34,099 pounds of copper.

Granite District.—District production comprised 13 tons of zinc-lead ore from the Beaver View group and 6 tons of silver ore from the Lucky Lu group.

San Francisco District.—Metal Producers, Inc., worked the Horn Silver mine under lease from January to August and again through December; the company 500-ton gravity-flotation mill was operated from about the middle of April to the middle of June. Mine production was 10,643 tons of lead milling ore containing 250 ounces of gold, 9,000 ounces of silver, 4,000 pounds of copper, 280,000 pounds of lead, and 25,000 pounds of zinc; and 35 tons of zinc-lead milling ore containing 1 ounce of gold, 158 ounces of silver, 126 pounds of copper, 5,229 pounds of lead, and 7,019 pounds of zinc. Remaining district output was 126 tons of zinc-lead milling ore from the Frisco Silver-Lead mine.

Star and North Star District.—James D. Williams, lessee, operated the Harrington-Hickory mine until May 15, then closed the mine because of low prices for lead and zinc. Production was 152 tons of

[1] Tintic district is in both Juab and Utah Counties. [2] Production from yard cleanings; property not counted as mine. [3] Includes production from Smelter district; Bureau of Mines not at liberty to publish separate figures.

gold-silver smelting ore containing 18 ounces of gold, 512 ounces of silver, 625 pounds of copper, and 3,585 pounds of lead; and 335 tons of zinc-lead milling ore containing 3 ounces of gold, 2,842 ounces of silver, 31,935 pounds of lead, and 57,772 pounds of zinc. J. C. Hanley, lessee, worked the Rebel mine for 1 month in 1949 and shipped 65 tons of lead smelting ore containing 1 ounce of gold, 327 ounces of silver, 104 pounds of copper, and 15,627 pounds of lead. Remaining district production was 38 tons of lead ore from the Wild Bill claim, 6 tons of similar ore from the Florence claim, and 16 tons of silver ore from the Last Chance claim.

BOX ELDER COUNTY

Lucin District.—I. M. Westover, lessee, worked the Copper Mountain (Salt Lake Copper) group from June through October and shipped 37 tons of lead smelting ore containing 1 ounce of gold, 261 ounces of silver, 168 pounds of copper, and 8,265 pounds of lead. Other district production was 7 tons of lead smelting ore from the property of the Utah Metal Mines.

JUAB COUNTY

Mount Nebo (Mona) District.—Staheli & Loveless worked the Vagabond group and shipped 41 tons of lead smelting ore containing 42 ounces of silver, 11,067 pounds of lead, and 800 pounds of zinc.

Tintic District.—The Tintic district, lying in both Juab and Utah Counties, is reviewed here. The following table gives metal production in each section of the district in 1949, a comparison with the total in 1948, and the grand total from 1869 to 1949.

Mine production of gold, silver, copper, lead, and zinc in Tintic district, Juab and Utah counties, Utah, 1948–49, and total, 1869–1949, in terms of recoverable metals

	Mines producing	Ore (short tons)	Gold (fine ounces)	Silver (fine ounces)	Copper (pounds)	Lead (pounds)	Zinc (pounds)	Total value
1949								
Juab County	8	137,719	2,196	771,990	186,400	12,440,400	11,865,500	$4,249,175
Utah County	7	22,729	2,937	142,160	339,500	910,800	297,800	479,171
Total: 1949	15	160,448	5,133	914,150	525,900	13,351,200	12,163,300	4,728,346
1948	21	175,897	11,007	1,123,460	1,002,800	11,939,400	7,360,200	4,735,701
Total 1869–1949	--------	[1] 15,382,390	2,619,898	262,930,065	245,373,864	1,901,481,679	96,456,438	407,470,997

[1] Figures estimated for certain years before 1901.

Chief Consolidated Mining Co. operated its Chief No. 1, Gemini, and Eureka Hill mines throughout 1949 and exceeded its 1948 tonnage by 5 percent. Output from the mines comprised 111,177 tons of zinc-lead ore containing 2,053 ounces of gold, 716,423 ounces of silver, 109,328 pounds of copper, 11,438,332 pounds of lead, and 14,874,730 pounds of zinc; 10,832 tons of silver ore containing 218 ounces of gold, 59,227 ounces of silver, 20,537 pounds of copper, and 740,490 pounds of lead; and 2,147 tons of lead ore containing 41 ounces of gold, 34,980 ounces of silver, 2,467 pounds of copper, 621,911 pounds of lead, and 121,700 pounds of zinc.

Other producing properties in the Juab County part of the district included the Dragon & Martha Washington group (gold-silver ore), Godiva mine (silver, lead, and zinc-lead ores), Mammoth mine (gold-silver ore), Park-Kingsley group (silver ore), Centennial-Beck-Victoria group (gold-silver, silver, lead, and zinc-lead ores), Eagle-Blue Bell mine (lead and gold-silver ores), and the Empire group (silver ore).

In the Utah County part of the district, the Eureka Lilly mine was the leading producer, but the mine was active only from March through June. Output was 5,936 tons of gold ore, 2,583 tons of gold-silver ore, and 213 tons of zinc-lead ore. The Tintic Standard mine of the Tintic Standard Mining Co. likewise was operated only from March through June. Production was 2,993 tons of silver smelting ore containing 72 ounces of gold, 43,025 ounces of silver, 16,940 pounds of copper, and 275,396 pounds of lead; and 1,163 tons of zinc-lead milling ore containing 33 ounces of gold, 11,454 ounces of silver, 3,292 pounds of copper, 241,794 pounds of lead, and 99,893 pounds of zinc. The company also operated the Harold dump from July through December and shipped 2,288 tons of old gold-silver mill tailings.

Remaining production from the area included zinc-lead ore and gold-silver ore from the Mountain View group, the North Lily group, and the Yankee group, and zinc-lead ore and gold ore from the Tintic Bullion group. The North Lily and Tintic Bullion groups closed at the end of June.

PIUTE COUNTY

Mount Baldy District.—Patrick T. Henry Corp. operated the Deep Tunnel group and shipped 836 tons of silver smelting ore.

Ohio District.—Principal production was 438 tons of gold-silver smelting ore from the Copper Belt Extension Tunnel property operated by the Patrick T. Henry Corp.

SALT LAKE COUNTY

Big Cottonwood District.—The Cardiff mine was the main producer, shipping 3,157 tons of zinc-lead ore containing 28 ounces of gold, 19,531 ounces of silver, 42,621 pounds of copper, 1,007,542 pounds of lead, and 974,267 pounds of zinc; 316 tons of lead ore containing 5 ounces of gold, 2,600 ounces of silver, 14,686 pounds of copper, 102,189 pounds of lead, and 11,031 pounds of zinc; and 225 tons of zinc ore containing 192 ounces of silver, 303 pounds of copper, 11,312 pounds of lead, and 172,983 pounds of zinc.

Little Cottonwood District.—Test shipments were made in 1949 from four separate parts of the South Hecla mine comprising 327 tons of lead ore containing 11 ounces of gold, 3,994 ounces of silver, 2,001 pounds of copper, 66,055 pounds of lead, and 62,952 pounds of zinc; 16 tons of zinc-lead ore containing 164 ounces of silver, 181 pounds of copper, 1,664 pounds of lead, and 1,581 pounds of zinc; and 7 tons of copper ore containing 85 ounces of silver, 361 pounds of copper, and 164 pounds of lead. Other district production was mainly 395 tons of lead ore from the Michigan-Utah waste dump; 88 tons of similar ore from the Flagstaff claim; 173 tons of lead ore, 35 tons of

zinc-lead ore, and 29 tons of copper ore from the Columbus-Rexall group; and 17 tons of silver ore from the Peruvian Consolidated group.

Smelter District.—Yard cleanings were the source of metal credited to the Smelter district in 1949.

West Mountain (Bingham) District.—In 1949 the West Mountain (Bingham) district produced 91 percent of the State gold, 64 percent of the silver, 99 percent of the copper, 61 percent of the lead, and 55 percent of the zinc; total value of the five metals represented 88 percent of the State total value.

Mine production of gold, silver, copper, lead, and zinc in West Mountain (Bingham) district, Salt Lake County, Utah, 1948–49, and total, 1865–1949, in terms of recoverable metals

Year	Mines producing	Ore (short tons)	Gold (fine ounces)	Silver (fine ounces)	Copper (pounds)	Lead (pounds)	Zinc (pounds)	Total value
1948	6	24,889,134	332,588	4,694,674	450,450,800	61,343,900	44,153,300	$130,490,268
1949	5	21,405,489	286,155	4,316,378	392,201,000	65,199,300	44,621,200	107,020,080
Total 1865–1949		[1] 598,904,991	6,847,186	156,952,186	[2] 5,355,961	[2] 1,651,464	[2] 544,531	2,181,245,979

[1] Figures estimated for certain years before 1901.
[2] Short tons.

Output of copper ore at the Utah Copper mine of the Kennecott Copper Corp. was about 14 percent less in 1949 than in 1948, owing to the previously mentioned work stoppage at the beginning of the year and the shorter workweek during much of the period of operation. Following settlement of the labor strike on February 7, the Magna and Arthur mills returned to operation and maintained a schedule of 6 days per week and three shifts per day for the remainder of the year. The company leaching plant at the mouth of Bingham Canyon recovered several million pounds of cement copper during the year from waste dumps.

Lead production increased over 5 percent at the United States & Lark property of the United States Smelting, Refining & Mining Co., and copper nearly 13 percent; gold output declined 11 percent, silver 2, and zinc less than 1 percent; and ore production gained 9 percent.

Combined Metals Reduction Co. and lessees operated the Butterfield group throughout the year and increased the ore output from 31,149 tons in 1948 to 38,300 tons in 1949. Yields of silver, lead, and zinc were considerably greater than in 1948, but yield of recoverable gold declined slightly. The 38,300 tons produced—all zinc-lead ore—contained 2,222 ounces of gold, 329,205 ounces of silver, 7,216,580 pounds of lead, and 3,011,860 pounds of zinc.

The Columbia group of the Ohio Copper Co. was operated by the company and lessees throughout 1949. Production was 4,145 tons of zinc-lead milling ore containing 357 ounces of gold, 12,958 ounces of silver, 45,560 pounds of copper, 380,056 pounds of lead, and 254,795 pounds of zinc.

Remaining district production was 690 tons of zinc-lead milling ore and 250 tons of lead smelting ore from the Apex-Delaware group.

SUMMIT AND WASATCH COUNTIES

Park City Region

The Park City region includes the Uintah district in Summit County and the Blue Ledge and Snake Creek districts in Wasatch County. The following table shows the production and total value of the five metals in 1949 compared with 1948 and the total from 1870 to 1949.

Mine production of gold, silver, copper, lead, and zinc in Park City region, Summit and Wasatch Counties, Utah, 1948–49, and total, 1870–1949, in terms of recoverable metals

Year	Mines producing	Ore (short tons)	Gold (fine ounces)	Silver (fine ounces)	Copper (pounds)	Lead (pounds)	Zinc (pounds)	Total value
1948	10	506,671	19,087	1,703,864	1,193,300	25,339,400	20,639,700	$9,749,907
1949	10	318,341	19,443	1,061,902	902,500	17,166,800	16,718,800	6,604,858
Total 1870–1949		[1]15,867,508	617,388	238,893,214	71,873,013	2,472,923,634	745,082,011	391,415,085

[1] Figures estimated for certain years before 1901.

The drop in base-metal prices forced the Silver King Coalition Mines Co. to close its property at the end of June. During its period of operation the 800-ton company flotation mill treated 23,112 tons of zinc-lead ore compared with 50,892 tons in 1948. The ore in 1949 contained 505 ounces of gold, 194,760 ounces of silver, 104,877 pounds of copper, 3,976,743 pounds of lead, and 1,800,000 pounds of zinc. In addition, 452 tons of lead ore were shipped direct to a smelter.

New Park Mining Co. closed its property on June 30, 1949, owing to weak base-metal prices, then reopened at the middle of September. Production for the year was 64,738 tons of zinc-lead milling ore (72,831 tons in 1948) and 21 tons of similar ore shipped to a smelter. The milling ore contained 18,486 ounces of gold, 376,504 ounces of silver, 772,835 pounds of copper, 5,586,531 pounds of lead, and 8,153,542 pounds of zinc.

Park Utah Consolidated Mines Co. operated its property throughout 1949 but on a greatly reduced basis after June 27, following sharp declines in the prices of lead and zinc. Ore output for the year was 39,410 tons compared with 44,753 tons in 1948. The ore in 1949 contained 3,086 ounces of gold, 260,688 ounces of silver, 123,178 pounds of copper, 7,068,451 pounds of lead, and 8,878,091 pounds of zinc.

Pacific Bridge Co. closed its 1,000-ton flotation mill on May 6, because of the slump in prices of lead and zinc. During its 1949 period of operation, the mill treated 119,773 tons of old zinc-lead tailings from the Grasselli dump, compared with 292,358 tons in 1948. Concentrates comprised 2,800 tons of lead concentrate containing 100 ounces of gold, 31,000 ounces of silver, 27,000 pounds of copper, 800,000 pounds of lead, and 240,000 pounds of zinc; and 1,806 tons of zinc concentrate containing 65 ounces of gold, 36,000 ounces of silver, 25,000 pounds of copper, 215,000 pounds of lead, and 1,800,000 pounds of zinc. In addition, 1,847 tons of old silver tailings were shipped direct to a smelter after the mill closed.

McFarland & Hullinger, lessees, operated the Daly No. 1 waste dump and shipped 50,951 tons of siliceous silver ore to a smelter. The West Park Mining Co. operated its property from June to October and shipped 255 tons of copper smelting ore containing 10 ounces of gold, 176 ounces of silver, and 21,182 pounds of copper. Silver King Western mine was operated by lessees from May to December. Output of ore, all shipped to smelters, comprised 1,530 tons of lead ore and 40 tons of silver ore. Reuben Garbett re-treated a substantial tonnage of current zinc tailings from the Silver King Coalition mill until the mill closed at the end of June. Remaining district production was 93 tons of silver smelting ore from the J. I. C. & West Quincy (New Quincy) property and 119 tons of lead ore from the Crescent mine dump.

TOOELE COUNTY

Blue Bell District.—Output was 80 tons of lead smelting ore from the Blackhawk claim.

Dugway District.—Production comprised 163 tons of zinc-lead milling ore from the Smelter Canyon & Four Metals group and 31 tons of lead smelting ore from the Dugway claim.

Erickson District.—The Desert Exploration Co. operated the Ida-Desert View group from March 1 to December 20 and shipped 246 tons of zinc-lead ore and 79 tons of lead ore. The Bar X Mining Co. worked the Esther group and shipped 447 tons of zinc-lead milling ore.

Ophir District.—McFarland & Hullinger operated the Hidden Treasure mine under lease and shipped 5,519 tons of zinc-lead ore, 480 tons of lead ore, and 265 tons of zinc-lead-copper ore. C. S. Lynch, lessee, conducted development throughout 1949 at the Mecca mine and shipped 229 tons of lead smelting ore containing 3 ounces of gold, 3,155 ounces of silver, 2,366 pounds of copper, 82,210 pounds of lead, and 23,370 pounds of zinc. Lessees operated the Mono-Kearsarge group and shipped 657 tons of zinc-lead-copper ore and 232 tons of copper ore. Lessees worked the Shoo Fly group and shipped 186 tons of zinc-lead-copper milling ore containing 15 ounces of gold, 5,128 ounces of silver, 9,610 pounds of copper, 19,764 pounds of lead, and 24,930 pounds of zinc. The Ophir Hill mine was operated until May 16 by the Ophir Development Co. and was then leased to the United States Smelting, Refining & Mining Co.; several thousand tons of zinc-lead milling ore were shipped. The Ophir unit of the United States Smelting, Refining & Mining Co. produced several cars of copper smelting ore.

Rush Valley District.—Ore production at the West Calumet (Calumet) mine of the Combined Metals Reduction Co. dropped from 38,396 tons in 1948 to 32,807 tons in 1949. All the ore in 1949 was zinc-lead milling ore and contained 2,093 ounces of gold, 238,817 ounces of silver, 6,009,860 pounds of lead, and 2,920,100 pounds of zinc. The company Honorine-Galena King group had a production of 816 tons of zinc-lead milling ore and 11 tons of lead smelting ore; and the Cyclone-Tip Top-Southport (Bluestone) group, 239 tons of lead smelting ore. The company flotation mill at Bauer treated 24,000 tons of pyritic gold-silver tailings, which yielded 7,643 tons of iron concentrate valuable chiefly for its gold and silver. Other dis-

trict production was 213 tons of zinc-lead milling ore and 80 tons of lead smelting ore from the Silver Eagle group and 52 tons of old silver tailings from the Bullion Lead property.

Smelter District.—Output credited to producers in the Smelter district comprised the metals recovered from 707 tons of old smelter cleanings from the plant of the International Smelting & Refining Co. at Tooele and 17,480 tons of old zinc slag treated at the company slag-fuming plant.

Willow Springs District.—Lessees operated the Oro Del Rey group from April 1 to December 20 and shipped to smelters 251 tons of lead ore containing 427 ounces of gold, 1,909 ounces of silver, 650 pounds of copper, 90,011 pounds of lead, and 3,075 pounds of zinc; and 152 tons of gold ore containing 208 ounces of gold, 503 ounces of silver, 501 pounds of copper, and 15,924 pounds of lead.

UTAH COUNTY

American Fork District.—Dutchman Mine Leasers operated the Dutchman group until October 1949, then closed because of economic conditions. Production during the year was 994 tons of zinc-lead milling ore containing 12 ounces of gold, 8,519 ounces of silver, 4,118 pounds of copper, 166,419 pounds of lead, and 430,501 pounds of zinc. Remaining district production was mainly 48 tons of zinc-lead milling ore from the Floral Lode claim.

Tintic District.—Mines in the Utah County section of the Tintic district are reviewed under Juab County.

WASHINGTON COUNTY

Harrisburg (Leeds) District.—F. S. Leany operated the Requa mine and shipped 240 tons of copper smelting ore.

Tutsagubet District.—E. L. Cox worked the Dixie (Apex) mine from January to May 15 and shipped to smelters 400 tons of lead ore containing 3 ounces of gold, 4,138 ounces of silver, 3,492 pounds of copper, and 102,022 pounds of lead; and 29 tons of copper ore containing 7 ounces of silver, and 7,822 pounds of copper. Wayne Snow, lessee, shipped 38 tons of lead ore from the Black Warrior claim.

Washington

Gold, Silver, Copper, Lead, and Zinc

(MINE REPORT)

By C. E. Needham and Paul Luff

GENERAL SUMMARY

OF THE production of gold, silver, copper, lead, and zinc in Washington in 1949, only gold rose (3 percent) above the 1948 levels. Silver output declined 5 percent, copper 7, lead 10, and zinc 15 percent. These decreases, coupled with lower average prices for base metals, reduced the total value of the five metals 14 percent, from $11,171,715 in 1948 to $9,613,307 in 1949. The value of gold increased nearly 3 percent, but that of silver declined almost 5 percent, copper 15, lead 21, and zinc 21 percent. Of the total value in 1949, zinc contributed 28 percent, gold 26, copper 22, lead 21, and silver 3 percent.

Chelan County remained in first place among Washington counties in 1949 in both tonnage of ore treated and value of metals produced. Pend Oreille County held second position in both respects.

All tonnage figures are short tons and "dry weight"; that is, they do not include moisture.

The value of metal production reported herein has been calculated at the following prices.

Prices of gold, silver, copper, lead, and zinc, 1945–49

Year	Gold [1] (per fine ounce)	Silver [2] (per fine ounce)	Copper [3] (per pound)	Lead [3] (per pound)	Zinc [3] (per pound)
1945	$35.00	$0.711+	$0.135	$0.086	$0.115
1946	35.00	.808	.162	.109	.122
1947	35.00	.905	.210	.144	.121
1948	35.00	.905+	.217	.179	.133
1949	35.00	.905+	.197	.158	.124

[1] Price under authority of Gold Reserve Act of Jan. 31, 1934. Treasury legal coinage value of gold from Jan. 18, 1837, to Jan. 31, 1934, was $20.67+ ($20.671835) per fine ounce.

[2] Treasury buying price for newly mined silver. 1945 to June 30, 1946: $0.71111111; July 1, 1946, to Dec. 31, 1947: $0.905; 1948–49: $0.9050505.

[3] Yearly average weighted price of all grades of primary metal sold by producers. Price in 1945–47 includes bonus payments by Office of Metals Reserve for overquota production.

Mine production of gold, silver, copper, lead, and zinc, in Washington, 1945–49, and total, 1860–1949, in terms of recoverable metals

Year	Mines producing		Ore (short tons)	Gold (lode and placer)		Silver (lode and placer)	
	Lode	Placer		Fine ounces	Value	Fine ounces	Value
1945	21	3	968,246	57,860	$2,025,100	281,444	$200,138
1946	16	5	858,023	51,168	1,790,880	264,453	213,678
1947	25	6	676,176	34,965	1,223,775	293,736	265,831
1948	30	1	974,257	70,075	2,452,625	375,831	340,146
1949	29	3	1,012,198	71,994	2,519,790	357,853	323,875
1860–1949			(1)	2,355,704	61,204,963	13,857,293	10,039,365

Year	Copper		Lead		Zinc		Total value
	Short tons	Value	Short tons	Value	Short tons	Value	
1945	5,821	$1,571,670	3,802	$653,944	11,693	$2,689,390	$7,140,242
1946	4,527	1,466,748	2,987	651,166	11,329	2,764,276	6,886,748
1947	2,240	940,800	5,359	1,543,392	13,800	3,339,600	7,313,398
1948	5,665	2,458,610	7,147	2,558,626	12,638	3,361,708	11,171,715
1949	5,275	2,078,350	6,417	2,027,772	10,740	2,663,520	9,613,307
1860–1949	92,106	26,178,269	94,686	16,276,814	174,993	31,743,476	145,442,887

[1] 1860–1903: Figures not available; 1904–49, 15,188,053 tons produced.

Mine production of gold, silver, copper, lead, and zinc in Washington in 1949, by months, in terms of recoverable metals

Month	Gold (fine ounces)	Silver (fine ounces)	Copper (short tons)	Lead (short tons)	Zinc (short tons)
January	5,975	31,643	465	495	810
February	5,935	35,165	460	385	710
March	6,770	35,675	480	550	810
April	7,075	39,445	485	545	830
May	6,240	38,050	435	467	825
June	6,245	33,255	475	460	950
July	4,312	23,990	365	390	547
August	5,355	25,515	450	410	620
September	4,895	20,405	385	240	748
October	4,885	21,840	350	695	1,505
November	6,545	24,305	465	895	1,265
December	7,762	28,565	460	885	1,120
Total: 1949	71,994	357,853	5,275	6,417	10,740
1948	70,075	375,831	5,665	7,147	12,638

Gold.—The increase of 1,919 ounces in Washington's gold output in 1949 resulted mainly from substantial shipments of gold ore during the second half of the year from the Gold King mine near Wenatchee. The Holden mine in Chelan County was the State's leading gold producer, followed in order by the Knob Hill mine in Ferry County, the Gold King mine in Chelan County, and the Aurum group in Ferry County. Yield of the metal increased slightly at the Holden mine but declined at the Knob Hill mine and the Aurum group. The above four properties contributed all but a small quantity of the State gold in 1949. Placer production was small and came from three producers, compared with one in 1948. Of the State gold in 1949, almost 60 percent was recovered from zinc-copper ore and most of the remainder from gold ore.

Gold produced at placer mines in Washington, 1945–49, by classes of mines and by methods of recovery

Class and method	Mines producing	Material treated (cubic yards)	Gold recovered		
			Fine ounces	Value	Average per cubic yard
Dragline dredges:					
1945					
1946	1	10,000	85	$2,975	$0.298
1947	1	3,500	14	490	.140
1948–49					
Nonfloating washing plants: [1]					
1945					
1946	1	15,000	11	385	.026
1947	3	4,700	56	1,960	.417
1948	1	2,900	10	350	.121
1949					
Small-scale hand methods:					
1945	3	275	14	490	1.782
1946	3	115	5	175	1.522
1947	2	400	7	245	.613
1948					
1949	3	400	10	350	.875
Grand total placers:					
1945	3	275	14	490	1.782
1946	5	25,115	101	3,535	.141
1947	6	8,600	77	2,695	.313
1948	1	2,900	10	350	121
1949	3	400	10	350	.875

[1] Includes all placer operations using power excavator and washing plant, both on dry land; an outfit with movable washing plant is termed a "dry-land dredge."

Silver.—Among the four leading State silver producers in 1949, only the Bonanza mine in Stevens County reported an increase. The Knob Hill mine (gold ore) remained in first place by a slight margin, followed by the Holden mine (zinc-copper ore), the Bonanza mine (lead ore), and the Aurum group (gold ore). These four furnished 89 percent of the State silver. Gold ore supplied 44 percent of the State silver in 1949, followed by zinc-copper ore with about 37 percent; most of the remainder came from lead and zinc-lead ores.

Copper.—The decline in State yield of copper in 1949 resulted from a drop of about 7 percent in output of the metal at the Holden mine in Chelan County. No other properties in the State contributed important quantities of copper.

Lead.—The main factor in reducing Washington's output of lead in 1949 was the continuation of the labor strike until September at the Grandview mine of the American Zinc, Lead & Smelting Co. in Pend Oreille County. As a result, lead output from this property in 1949 was only 54 percent of that in 1948. Production of the metal also declined at the Deep Creek mine in Stevens County, but substantial increases were reported from the property of the Pend Oreille Mines & Metals Co. in Pend Oreille County and the Bonanza mine in Stevens County. The above four properties supplied 97 percent of the State lead in 1949. Of the total lead, 64 percent was derived from zinc-lead ore and nearly all the remainder from lead ore.

Zinc.—The work stoppage at the Grandview mine had the same effect on State production of zinc in 1949 as it did on lead. Output of the metal also declined at the Holden and Deep Creek mines but rose markedly at the property of the Pend Oreille Mines & Metals Co. The Metaline Mining & Leasing Co. returned to production at

its property in Pend Oreille County in September when ore-treatment facilities again became available at the Grandview mill of the American Zinc, Lead & Smelting Co. The property of the Pend Oreille Mines & Metals Co. was the State's leading zinc producer in 1949, followed by the Holden, Grandview, and Deep Creek mines, which together supplied 96 percent of the total zinc. Zinc-lead ore supplied over 59 percent of the zinc in 1949, zinc-copper ore 25, and zinc ore 15 percent.

MINE PRODUCTION BY COUNTIES

Mine production of gold, silver, copper, lead, and zinc in Washington in 1949, by counties, in terms of recoverable metals

County	Mines producing		Gold (lode and placer)		Silver (lode and placer)	
	Lode	Placer	Fine ounces	Value	Fine ounces	Value
Benton		1	1	$35		
Chelan	3	1	48,183	1,686,405	135,662	$122,781
Ferry	3		23,751	831,285	153,429	138,861
Kittitas		1	2	70		
Okanogan	1				7,635	6,910
Pend Oreille	3				11,396	10,314
Snohomish	3		13	455	1,106	1,001
Stevens	15		21	735	48,604	43,989

1948	11,330,000	2,458,610	14,294,000	2,558,626	25,276,000	3,361,708	11,171,715

MINING INDUSTRY

The number of producing lode mines in Washington declined from 30 in 1948 to 29 in 1949, but ore output rose almost 4 percent and was the greatest since 1944. Ore production increased at the Holden, Knob Hill, and Bonanza mines, and at the property of the Pend Oreille Mines & Metals Co.; declines were reported by the Aurum group and the Deep Creek and Grandview mines. The work stoppage at the Grandview mine, which began at midnight June 30, 1948, was settled on September 6, 1949.

ORE CLASSIFICATION

Details of ore classification are given in the Gold and Silver chapter of this volume.

Ore sold or treated in Washington in 1949, with content in terms of recoverable metals

Source	Mines producing	Ore (short tons)	Gold (fine ounces)	Silver (fine ounces)	Copper (pounds)	Lead (pounds)	Zinc (pounds)
Dry gold ore	5	69,836	28,989	158,242			
Dry silver ore	2	3,246		8,351	3,500	64,400	4,500
Copper ore	3	106	13	1,106	28,500	1,600	
Lead ore	6	14,422		36,027	3,300	4,005,060	3,255
Zinc ore	6	54,605	12	2,411		580,187	3,249,315
Zinc-copper ore	1	627,316	42,961	130,733	10,498,200		5,447,000
Zinc-lead ore	7	242,667	9	20,983	16,500	8,182,753	12,775,930
Total lode mines	[1] 29	1,012,198	71,984	357,853	10,550,000	12,834,000	21,480,000
Placers	3		10				
Total: 1949	[1] 32	1,012,198	71,994	357,853	10,550,000	12,834,000	21,480,000

[1] A mine producing more than 1 class of ore is counted but once in arriving at total for all classes.

METALLURGIC INDUSTRY

Of the 1,012,198 tons of lode material sold or treated in Washington in 1949, 994,458 tons (98 percent) went to mills and 17,740 tons (2 percent) to smelters, compared with 98 and 2 percent, respectively, in 1948. The 994,458 tons treated at mills were distributed as follows: 1 plant, 627,316 tons of zinc-copper ore; 4 plants, 242,589 tons of zinc-lead ore; 3 plants, 52,547 tons of gold ore; 2 plants, 14,175 tons of lead ore; 3 plants, 54,586 tons of zinc ore; and 2 plants, 3,245 tons of silver ore.

REVIEW BY COUNTIES AND DISTRICTS

CHELAN COUNTY

Chelan Lake District.—The Howe Sound Co. operated its Holden mine and 2,000-ton concentration mill throughout 1949; 627,316 tons of zinc-copper ore were treated by selective flotation and 333,495 tons of current sands and slimes by cyanidation. Gross metal content of the ore treated was 49,197 ounces of gold, 197,083 ounces of silver, 11,434,952 pounds of copper, and 8,091,517 pounds of zinc.

Peshastin Creek (Blewett) District.—District output was principally 20 tons of gold ore from the Polepick claim.

Wenatchee District.—The E. H. Lovitt Syndicate opened the Gold King mine in July and during the remainder of the year shipped several thousand tons of highly siliceous gold ore to a smelter.

[1] No output of silver from placer operations in 1949.
[2] District production combined; Bureau of Mines not at liberty to publish individual production.

FERRY COUNTY

Orient District.—The Talisman Mining & Leasing Co. operated its mill during part of the year and shipped 37 tons of zinc concentrate from zinc ore produced.

Republic (Eureka) District.—Knob Hill Mines, Inc., operated its mine and 400-ton flotation-cyanidation mill on gold ore during all of 1949 and treated about 2 percent more ore than in 1948. The Aurum group of the Aurum Mining Co. was operated intermittently during the year by the company and by lessees; ore sold in 1949 was less than half of that sold in 1948.

OKANOGAN COUNTY

Loomis-Oroville District.—Kaaba Silver-Lead Mines, Inc., operated its Kaaba mine and mill from January to June 15, and shipped 60 tons of silver-lead concentrate from the treatment of 2,405 tons of silver ore in the company 300-ton sink-float-flotation mill.

PEND OREILLE COUNTY

Metaline District.—Following the settlement of its labor strike on September 6, the American Zinc, Lead & Smelting Co. resumed operations at its Grandview mine on September 20. During the remainder of the year the company treated 51,690 tons of zinc-lead ore in its 700-ton flotation mill.

The Pend Oreille Mines & Metals Co. operated its property and 700-ton flotation mill throughout 1949 and treated 186,955 tons of zinc-lead ore, compared with 133,755 tons in 1948. Gross metal content of the ore in 1949 was 18,000 ounces of silver, 30,000 pounds of copper, 6,655,598 pounds of lead, and 9,646,878 pounds of zinc. The mill produced 4,365 tons of lead concentrate and 7,313 tons of zinc concentrate.

The Metaline Mining & Leasing Co. resumed operations in September when ore-treatment facilities became available at the Grandview mill of the American Zinc, Lead & Smelting Co. During the remainder of the year 5,317 tons of zinc-lead ore were milled.

SNOHOMISH COUNTY

Index District.—District production was all copper smelting ore—84 tons from the Sunset mine, which contained 4 ounces of gold, 519 ounces of silver, and 25,680 pounds of copper; and 5 tons from the Wilbur-Index group.

STEVENS COUNTY

Bossburg (Clugston Creek) District.—Bonanza Lead operated its Bonanza mine throughout the year and treated, in the company 100-ton flotation mill, 14,163 tons (12,386 tons in 1948) of lead ore containing 42,000 ounces of silver, 6,000 pounds of copper, 4,285,000 pounds of lead, and 72,000 pounds of zinc; the mill produced 3,108 tons of lead concentrate. Zinc-lead milling ore was produced from the Young America mine; shipments comprised 60 tons of lead concentrate and 161 tons of zinc concentrate. Remaining district production was mainly 27 tons of zinc-lead ore and 12 tons of lead ore from the High Cliff mine and 21 tons of lead ore from the Colville Queen claim.

Kettle Falls District.—The Warfield-Munsell Mining Co. did prospecting and developing at the Silver Queen (Ark) mine during the first 6 months of the year; about 1 ton of high-grade silver ore was shipped to a smelter, and 840 tons of low-grade silver ore were treated in the 40-ton flotation mill on the property.

Northport (Aladdin) District.—The Deep Creek mine and 260-ton flotation mill of the Goldfield Consolidated Mines Co. operated on zinc ore in 1949; the mill treated 45,439 tons of ore containing 24 ounces of gold, 2,700 ounces of silver, 635,000 pounds of lead, and 3,230,000 pounds of zinc. The Admiral mine of the Admiral Consolidated Mining Co. was operated until September 1. About 390 tons of zinc ore were treated in the company 75-ton flotation mill; gross metal content was 20 ounces of silver, 1,500 pounds of lead, and 42,000 pounds of zinc. The mill produced 25 tons of zinc concentrate and about 1 ton of lead concentrate. Leadpoint Electric Mining Co. operated the Electric Point mine and shipped 106 tons of lead ore to a

smelter, and 115 tons of similar ore were shipped from the Gladstone Mountain mine by the Gladstone Mountain Mining Co. About 3,000 tons of zinc ore from the Iroquois dump were hauled to a custom mill for treatment by the Mines Management, Inc. Last Chance Consolidated Mines, Inc., operated the Last Chance group and treated about 850 tons of zinc-lead ore in the company 100-ton gravity-flotation mill. Consolidated Speculator Corp. operated the Lucille group until October and shipped 44 tons of zinc-lead ore to a smelter.

WHATCOM COUNTY

Slate Creek District.—The Slate Creek Mining Co. operated the Bonita-New Light-Eureka Gold group for 2½ months in 1949 and treated 143 tons of gold ore in the company flotation mill.

Wyoming
Gold, Silver, Copper, and Lead

(MINE REPORT)

By A. J. Martin

GENERAL SUMMARY

MINES in Wyoming produced 389 fine ounces of gold and 21 fine ounces of silver in 1949 compared with 115 ounces of gold and 11 ounces of silver in 1948. Nearly all the output in both years came from the Carissa mine in the South Pass district, Fremont County. This mine had a substantial output in 1947 and was under development, with intermittent production in 1948 and 1949. No output of copper, lead, or zinc was reported in the State in 1948 or 1949.

Records of past production credit Wyoming with an output of gold, silver, copper, and lead valued altogether at $7,647,183 from 1867 through 1949. Copper represented about three-fourths of the total value and was mined in the Copper Mountain district, Fremont County; Encampment district, Carbon County; Hartville district, originally in Laramie County, now in Platte County; and Laramie (Douglas Creek) district, Albany County. The lead came from the Spring Creek district in Carbon County, the Hurricane district in Crook County, and the Douglas Creek district in Albany County. Gold and silver were produced from many localities throughout the State.

All tonnage figures are short tons and "dry weight," that is, they do not include moisture.

The value of the metal production reported herein has been calculated at the following prices.

Prices of gold, silver, copper, lead, and zinc, 1945–49

Year	Gold [1] (per fine ounce)	Silver [2] (per fine ounce)	Copper [3] (per pound)	Lead [3] (per pound)	Zinc [3] (per pound)
1945	$35.00	$0.711+	$0.135	$0.086	$0.115
1946	35.00	.808	.162	.109	.122
1947	35.00	.905	.210	.144	.121
1948	35.00	.905+	.217	.179	.133
1949	35.00	.905+	.197	.158	.124

[1] Price under authority of Gold Reserve Act of Jan. 31, 1934. Treasury legal coinage value of gold from Jan. 18, 1837, to Jan. 31, 1934, was $20.67+($20.671835) per fine ounce.
[2] Treasury buying price for newly mined silver. 1945 to June 30, 1946: $0.71111111; July 1, 1946, to Dec. 31, 1947: $0.905; 1948–49: $0.9050505.
[3] Yearly average weighted price of all grades of primary metal sold by producers. Price in 1945–47 includes bonus payments by Office of Metals Reserve for overquota production.

Mine production of gold, silver, copper, and lead in Wyoming, 1945–49, and total, 1867–1949, in terms of recoverable metals

Year	Ore (short tons)	Gold (lode and placer)		Silver (lode and placer)		Copper		Lead		Total value

REVIEW BY COUNTIES

FREMONT COUNTY

Development work was continued at the Carissa mine in the South Pass district, and ore was mined intermittently during 1949. The ore was treated in a mill at the mine. The mill equipment includes crushers, a ball mill, two-cell mineral jig, amalgamation barrel, classifier, thickening tanks, cyanide-leaching tanks, precipitators, and a melting furnace. David F. Haddenham drove 82 feet of tunnel on his St. Louis property south of Atlantic City and shipped a little gold recovered from pannings obtained in sampling. Previous development on the property included a 110-foot shaft and a 285-foot tunnel. A placer miner shipped 1.5 ounces of crude placer gold.

TETON COUNTY

One ounce of gold was recovered while assessment work was being done on the Sterling placer on Pacific Creek, 15 miles northeast of Moran. A small placer machine used on the Mercury claim 10 miles below the Moran Dam recovered 2 ounces of material containing 1 fine ounce of gold.

PART IV. FOREIGN REVIEW

Mineral Production of the World, 1948–49

❖

By Berenice B. Mitchell, Pauline Roberts, and Helen L. Hunt[1]

THE statistical tables in this chapter present, for every country, the quantities of each major mineral produced in 1948–49. The figures are on a mine basis, unless otherwise indicated, except for cement, coke, nitrogen, and steel, which are measured at the processing plant. The tables are essentially a retabulation, by countries, of the 54 commodity world tables appearing in the various chapters of this volume. For lack of comprehensive information, data for the following minerals are excluded: Andalusite, aplite, asphalt, boron, bromine, calcite (optical), calcium chloride (natural), carbon dioxide, clay, columbium (niobium), diatomite (kieselguhr), dumortierite, emery, garnet (abrasive), gem stones (other than diamonds), germanium, greensand, grindstones, helium, indium, iodine, kyanite, lithium, magnesium compounds (other than magnesite), meerschaum, mineral pigments, monazite, natural gas, natural gasoline, oil shale, olivine, perlite, pumice, quartz crystal, radium, sand and gravel, selenium, sillimanite, sodium salts (other than common salt), stone, strontium, sulfur (byproduct), tantalum, tellurium, thallium, topaz (industrial), tripoli, uranium, vermiculite, wollastonite, and zirconium.

The statistics in these tables were derived principally from questionnaires sent, in cooperation with the United States Department of State, to the governments of each country. Supplementary sources were United States consular reports, the Imperial Institute's Mineral Industry of the British Commonwealth and Foreign Countries—Statistical Summary, other official publications of various countries, the United Nations Statistical Yearbook, the Year Book of the American Bureau of Metal Statistics, Minerais et Metaux, business magazines, and company reports. Where official data were not available, estimates were often supplied by Bureau of Mines commodity specialists.

Tables similar to those in this chapter and covering 1924–29 were published by the Bureau of Mines in Mineral Resources of the United States, 1930, part I, pages 859–962.

In the following tables, figures marked with an asterisk (*) are preliminary. Coke entries are for coke made at high temperatures (over 1,000° C.) in slot-type or beehive ovens and exclude gas house or retort coke.

Aluminum, smelter	333,007	332,799
Antimony [1]	129	64
Arsenic, white, smelter	527	272
Asbestos (sales)[2]	650,239	521,543
Barite	86,860	36,029
Bismuth (kilograms)[3]	108,971	93,893
Cadmium, smelter (kilograms)	347,491	383,185
Cement, hydraulic	2,242,773	2,541,536
Chromite	1,556	242
Coal:		
Coal (thousand tons)	15,296	15,640
Lignite (thousand tons)	1,442	1,696
Cobalt [4]	701	278
Coke	3,116,221	3,041,315
Copper:		
Mine	222,513	239,149
Smelter	200,736	206,394
Feldspar (shipments)	49,760	30,475
Fluorspar	58,120	56,212
Fuel briquets	323,133	459,908
Gold (troy ounces)	3,529,608	4,103,856
Graphite	2,303	1,905
Gypsum	3,164,211	2,716,820
Iron ore	2,704,739	3,424,174
Iron and steel:		
Pig iron and ferro-alloys	2,151,439	2,146,347
Steel ingots and castings	2,903,411	2,891,119
Lead:		
Mine	171,800	165,419
Smelter	145,246	132,582
Magnesite	(5)	(5)

Mineral	1948	1949
Manganese ore (shipments)	3	----------
Mica (sales)	3,584	821
Molybdenum	83	----------
Nickel	119,512	116,417
Nitrogen, fertilizer [6]	160,570	175,420
Peat:		
Fuel	77	51
Peat moss	81,465	56,074
Petroleum, crude (thousand barrels)	12,287	22,220
Phosphate rock	----------	11
Platinum-group metals:		
Platinum (troy ounces)	121,404	151,317
Other platinum-group metals (troy ounces)	148,343	192,106
Pyrites (including cupreous pyrites)	166,985	226,958
Salt	672,457	680,137
Silver (troy ounces)	16,109,982	16,937,641
Talc, pyrophyllite, and soapstone	26,109	25,198
Tin:		
Mine (long tons)	309	276
Smelter (long tons)	309	276
Titanium concentrates: Ilmenite	4,029	----------
Tungsten concentrates, 60% WO_3 basis	791	191
Zinc:		
Mine	247,780	263,710
Smelter	178,329	187,588

[1] Includes antimony content of antimonial lead.
[2] Exclusive of sand, gravel, and stone.
[3] Refined metal, plus bismuth content of bullion exported.
[4] Figures comprise Canadian ore processed in Canada and exported (irrespective of year when mined), plus cobalt content of oxide made from Sudbury ore at Port Colborne.
[5] Actually magnesitic dolomite and brucite valued at C$1,587,709 in 1948 and C$1,536,200 in 1949. Tonnage data not available.
[6] Fiscal year ended June 30 of year stated.

COSTA RICA

TABLE 3.—Mineral production, 1948–49, in metric tons

Mineral [1]	1948	1949	Mineral [1]	1948	1949
Gold (troy ounces) [2]	1,096	284	Silver (troy ounces) [2] [4]	3,029	720
Salt	6,500	(3)			

[1] Manganese ore is produced, but data are not available. See also p. 1603.
[2] Imports into United States.
[3] Data not available.
[4] Including scrap.

CUBA

TABLE 4.—Mineral production, 1948–49, in metric tons

Mineral [1]	1948	1949	Mineral [1]	1948	1949
Barite (exports)		(2)	Iron ore	36,595	11,961
Cement, hydraulic	284,954	313,300	Manganese ore	29,073	62,503

Fluorspar (exports)	75,381	*56,000	Smelter (long tons)	181	358
Gold (troy ounces)	367,612	405,550	Tungsten concentrates, 60 percent WO_3 basis	168	82
Graphite	35,261	23,812	Zinc:		
Iron ore	333,100	362,600	Mine	154,340	172,320
Iron and steel:			Smelter	48,323	53,496
Pig iron	270,391	355,760			
Steel ingots and castings	268,800	*358,300			

[1] Barite, fuel briquets, gypsum, magnesite, and mica are produced but data are not available. See also p. 1603.
[2] Includes antimonial content of antimonial lead.
[3] Cadmium content of flue dust exported for treatment elsewhere; represents in part shipments from stocks on hand.
[4] Data not available.
[5] United States imports from Mexico.

PANAMA

TABLE 11.—Mineral production, 1948–49, in metric tons

Mineral	1948	1949
Cement	41, 300	53, 600
Gold (troy ounces)	1, 000	[1] 9, 657
Salt	3, 374	* 3, 300

[1] Exports.

TRINIDAD

Production of crude petroleum in Trinidad totaled 20,111,000 barrels in 1948 and 20,617,000 barrels in 1949.

UNITED STATES (INCLUDING TERRITORIES)

TABLE 12.—Mineral production, 1948–49, in metric tons

Mineral [1]	1948	1949
Aluminum, smelter	565, 587	547, 449
Antimony	5, 416	1, 365
Arsenic, white, smelter	16, 909	11, 607
Asbestos (sold or used by producers)	33, 649	39, 360
Barite	705, 642	663, 428
Bauxite (dried equivalent)	1, 480, 535	1, 167, 230
Beryllium concentrates (mine shipments)	90	314
Cadmium, smelter:		
Metallic cadmium (kilograms)	3, 439, 555	3, 639, 432
Cadmium compounds (Cd content, kilograms)	87, 405	159, 185
Cement, hydraulic	35, 626, 454	36, 312, 780
Chromite	3, 283	393
Coal:		
Anthracite, Pennsylvania (thousand tons)	51, 836	38, 738
Bituminous (thousand tons)	541, 072	391, 898
Lignite (thousand tons)	2, 799	2, 725
Cobalt (shipments)	263	306
Coke, metallurgical	67, 913, 244	57, 730, 603
Copper:		
Mine	757, 326	682, 880
Smelter [2]	839, 550	779, 842
Feldspar (sold or used by producers)	468, 107	375, 307
Fluorspar (shipments)	300, 956	214, 733
Fuel briquets:		
Briquets	2, 838, 092	2, 180, 834
Packaged fuel	142, 439	114, 258
Gold (fine ounces) [3]	2, 025, 480	1, 921, 949
Graphite	9, 026	5, 536
Gypsum	6, 581, 169	5, 994, 752
Iron ore	102, 624, 598	86, 300, 694
Iron and steel:		
Pig iron and ferro-alloys	56, 214, 008	49, 774, 775
Steel ingots and castings [4]	80, 412, 862	70, 740, 242
Lead:		
Mine	354, 232	371, 860
Refinery [5]	363, 092	431, 695
Magnesite	(6)	260, 646
Magnesium metal	9, 075	10, 521
Manganese ore (shipments)	118, 931	114, 427
Mercury (flasks)	14, 388	9, 930
Mica (sold or used by producers):		
Block	122	233
Scrap	47, 316	29, 806
Molybdenum	12, 114	10, 219
Nickel, refinery	801	717
Nitrogen, fertilizer [7]	905, 260	975, 000
Peat	117, 553	117, 509
Petroleum, crude (thousand barrels)	2, 020, 185	1, 840, 307
Phosphate rock (sold or used by producers)	8, 807, 903	9, 131, 173
Platinum-group metals (troy ounces):		
Platinum	14, 992	19, 013
Other platinum-group metals	4, 261	5, 794
Potassium salts (equivalent K_2O)	1, 034, 077	1, 014, 586
Pyrites, including cupreous pyrites	943, 434	905, 746
Salt:		
Rock salt	3, 489, 782	3, 146, 105
Other salt	11, 390, 957	10, 997, 464
Silver (troy ounces)	39, 228, 468	34, 944, 554
Sulfur, native (long tons)	4, 869, 210	4, 745, 014
Talc, pyrophyllite, and soapstone (sold by producers)	470, 596	412, 023
Tin:		
Mine (long tons)	5	68
Smelter (long tons) [8]	36, 703	35, 834
Titanium concentrates:		
Ilmenite	348, 126	364, 989
Rutile	6, 695	10, 875
Tungsten concentrates, 60% WO_3 basis (shipments)	3, 659	2, 568
Zinc:		
Mine	571, 506	538, 145
Smelter	714, 644	739, 154

[1] Excludes bismuth and vanadium, data for which Bureau of Mines is not at liberty to publish. See also p. 1603.
[2] Smelter output from domestic and foreign ores, exclusive of scrap. Production from domestic ores only was as follows: 1948, 764,278 tons; 1949, 687,580 tons.
[3] Refinery production.
[4] Data from American Iron and Steel Institute. Includes only that portion of steel for castings, produced in foundries operated by companies manufacturing steel ingots.
[5] Figures cover lead refined from domestic and foreign ores but not from foreign base bullion.
[6] Bureau of Mines not at liberty to publish figures.
[7] Fiscal year ended June 30 of year stated.
[8] Including tin content of ores used direct to make alloys.

ARGENTINA

TABLE 13.—Mineral production, 1948–49, in metric tons

Mineral [1]	1948	1949
Beryllium concentrates	[2] 50	(3)
Cement, hydraulic	1,251,770	1,445,862
Chromite	-------	(3)
Gold (troy ounces)	*8,000	*8,000
Lead:		
Mine	21,800	16,000
Smelter	17,830	15,000
Petroleum, crude (thousand barrels)	23,734	22,961
Silver (troy ounces)	*1,201,900	*1,249,421
Sulfur, native (long tons)	(3)	9,842
Tin:		
Mine (long tons)	273	*300
Smelter (long tons)	254	*300
Tungsten concentrates, 60% WO_3 basis	33	(3)
Zinc:		
Mine	10,970	9,830
Smelter	1,602	2,648

[1] Antimony, arsenic, asbestos, barite, bismuth, coal, corundum, feldspar, fluorspar, graphite, gypsum, iron ore, magnesite, manganese ore, mica, peat, salt, talc, and vanadium are produced, but data are not available. See also p. 1603.
[2] Estimate based on United States imports.
[3] Data not available.

BOLIVIA

TABLE 14.—Mineral production,[1] 1948–49, in metric tons

Mineral [2]	1948	1949
Antimony	11,280	9,453
Asbestos	147	(3)
Bismuth in ore and bullion [4]	35,142	8,222
Cement, hydraulic	39,130	41,546
Cobalt	-------	(3)
Copper, mine	6,616	5,074
Fluorspar	227	264
Gold (fine ounces)	4,063	32,415
Lead	25,600	26,352
Petroleum, crude (thousand barrels)	464	678
Silver (fine ounces)	7,562,208	6,634,627
Sulfur, native (long tons)	2,707	4,398
Tin:		
Mine (long tons)	37,336	34,115
Smelter (long tons)	81	402
Tungsten concentrates, 60 percent WO_3 basis	2,485	2,543
Zinc	21,124	14,197

[1] All data are exports, except that those for cement, lead, petroleum, and zinc are actual production.
[2] Mica and salt are produced, but data are not available. See also p. 1603.
[3] Data not available.
[4] Excludes bismuth content of tin concentrates exported.

BRAZIL

TABLE 15.—Mineral production, 1948–49, in metric tons

Mine	6,006	6,293
Smelter	42,000	41,040

[1] Barite, beryl, bismuth, gold, and lead (smelter) are produced, but data are not available. See also p. 1603.
[2] Data not available.
[3] Fiscal year ended June 30 of year stated.

POLAND

TABLE 42.—Mineral production, 1948–49, in metric tons

Mineral [1]	1948	1949	Mineral [1]	1948	1949
Cement, hydraulic	1,823,857	2,200,000	Iron ore	602,000	[3] 506,801
Coal:			Iron and steel:		
Bituminous (thousand tons)	70,262	69,900	Pig iron and ferro-alloys	1,113,000	(2)
Lignite (thousand tons)	5,040	*4,585	Steel ingots and castings	1,954,000	2,297,300
Coke	5,183,300	5,815,700	Lead, smelter	16,874	*17,000
Fuel briquets:			Nitrogen, fertilizer [4]	41,140	55,080
Bituminous	717,508	796,000	Petroleum, crude (thousand barrels)	*1,039	*965
Lignite	113,633	175,000	Salt	725,774	800,000
Gypsum	14,183	(2)	Zinc, smelter	87,089	(2)

[1] Cadmium, magnesite, peat, phosphate rock, potassium salts, pyrites, and silver are produced, but data are not available. See also p. 1603.
[2] Data not available.
[3] January to September, inclusive.
[4] Fiscal year ended June 30 of year stated.

PORTUGAL

TABLE 43.—Mineral production, 1948–49, in metric tons

Mineral [1]	1948	1949	Mineral [1]	1948	1949
Antimony	38	(2)	Manganese ore	280	508
Arsenic, white, smelter	(2)	[3] 228	Mica	--------	(2)
Barite	406	(2)	Peat	1,502	266
Beryllium concentrates	*10	*20	Pyrites, including cupreous pyrites	561,136	622,925
Cement, hydraulic	496,800	518,400	Silver (troy ounces)	35,366	(2)
Coal:			Tin:		
Bituminous and anthracite (thousand tons)	387	444	Mine (long tons) [4]	750	820
Lignite (thousand tons)	103	111	Smelter (long tons)	282	*240
Fuel briquets	49,681	(2)	Titanium concentrates: Ilmenite	155	680
Gold (troy ounces)	11,799	(2)	Tungsten concentrates, 60 percent WO_3 basis	2,944	2,700
Gypsum	42,842	(2)			

[1] Asbestos, chromite, feldspar, iron ore, lead (smelter), and salt are produced, but data are not available. See also p. 1603.
[2] Data not available.
[3] January to June, inclusive.
[4] Excluding content of mixed concentrates.

RUMANIA

TABLE 44.—Mineral production, 1948–49, in metric tons

Mineral [1]	1948	1949	Mineral [1]	1948	1949
Cement, hydraulic	452,000	560,000	Iron and steel:		
Coal:			Pig iron and ferro-alloys	*80,000	*280,000
Bituminous and anthracite (thousand tons)	} 2,631	*191	Steel ingots and castings	*200,000	*265,000
Lignite (thousand tons)	}	2,378	Lead	--------	(2)
Gold (troy ounces)	90,000	120,000	Manganese ore	*47,000	*65,000
Iron ore	*140,000	*200,000	Petroleum, crude (thousand barrels)	*34,600	*33,700

[1] Bauxite, beryl, bismuth, coke, copper (smelter), feldspar, fuel briquets, gypsum, lead (smelter), mercury, mica, molybdenum, phosphate rock, pyrites, salt, silver, talc, and zinc (smelter) are produced, but no data are available. See also p. 1603.
[2] Data not available.

SPAIN

TABLE 45.—Mineral production, 1948–49, in metric tons

Mineral [1]	1948	1949
Aluminum, smelter	523	(2)
Antimony (includes Spanish Morocco)	132	150
Arsenic, white, smelter	573	(2)
Asbestos	35	(2)
Barite	14,153	(2)
Bauxite	6,805	10,293
Bismuth (kilograms)	24,269	(2)
Cement, hydraulic	2,330,850	2,227,675
Coal:		
Bituminous and anthracite (thousand tons)	10,627	10,641
Lignite (thousand tons)	1,400	1,321
Coke	848,375	969,413
Copper:		
Mine [3]	5,503	6,702
Smelter	18,640	9,016
Feldspar	9,807	(2)
Fluorspar	30,250	61,915
Fuel briquets	1,005,285	1,140,959
Gold (troy ounces)	11,375	30,318
Graphite	241	(2)
Gypsum	1,421,899	1,293,552
Iron ore	1,630,728	1,811,112
Iron and steel:		
Pig iron and ferro-alloys	537,240	632,438
Steel ingots and castings	623,696	648,517
Lead:		
Mine	27,300	29,500
Smelter	20,926	27,364
Magnesite	9,897	6,691
Manganese ore	18,525	*19,000
Mercury (flasks)	22,684	32,289
Mica	11	9
Phosphate rock	23,012	23,093
Potassium salts (equivalent K_2O)	151,185	(2)
Pyrites, including cupreous pyrites	1,463,912	1,132,793
Salt:		
Rock salt	292,881	(2)
Other salt	696,600	(2)
Silver (troy ounces)	339,396	514,090
Sulfur, native (long tons)	2,500	5,000
Talc and soapstone	29,984	38,208
Tin:		
Mine (long tons)	261	*300
Smelter (long tons)	483	718
Titanium concentrates: Ilmenite	181	311
Tungsten concentrates, 60 percent WO_3 basis	876	888
Zinc:		
Mine	42,350	44,860
Smelter	21,203	19,551

[1] Beryl and cobalt are produced, but data are not available. See also p. 1603.
[2] Data not available.
[3] According to the Yearbook of the American Bureau of Metal Statistics.

SWEDEN

TABLE 46.—Mineral production, 1948–49, in metric tons

Mineral [1]	1948	1949
Aluminum, smelter	3,279	4,000
Arsenic, white, smelter	[2] 19,100	(3)
Barite	1,914	(3)
Bismuth, smelter (kilograms)	--------	(3)
Cement, hydraulic	1,486,450	1,700,000
Chromite	--------	(3)
Coal (thousand tons)	374	311
Cobalt	--------	(3)
Coke	73,800	82,600
Copper:		
Mine	14,835	16,273
Smelter	17,180	14,359
Feldspar	38,687	(3)
Fluorspar	4,303	(3)
Gold (troy ounces)	71,889	80,280
Graphite	--------	(3)
Gypsum	--------	(3)
Iron ore	13,287,118	*14,000,000
Iron and steel:		
Pig iron and ferro-alloys	803,586	801,000
Steel ingots and castings	1,256,917	1,366,400
Lead:		
Mine	23,579	23,900
Smelter	6,228	10,757
Manganese ore	8,417	(3)
Mica	64	(3)
Nickel	--------	(3)
Peat	375,000	(3)
Phosphate rock	1,441	(3)
Pyrites, including cupreous pyrites	392,033	(3)
Silver (troy ounces)	1,137,943	1,140,708
Talc and soapstone	11,703	(3)
Tungsten concentrates, 60 percent WO_3 basis	317	468
Zinc	31,918	31,624

[1] Fuel briquets and molybdenum are produced, but data are not available. See also p. 1603.
[2] Includes 7,900 metric tons crude (92.99 percent As_2O_3).
[3] Data not available.

SVALBARD (SPITSBERGEN)

Production of coal in Svalbard (Spitsbergen) totaled 437,000 metric tons in 1948 and 500,000 tons (preliminary figure) in 1949.

SWITZERLAND

TABLE 47.—Mineral production, 1948–49, in metric tons

Mineral [1]	1948	1949	Mineral [1]	1948	1949
Aluminum, smelter	18, 960	22, 000	Iron ore	*75, 000	40, 000
Asbestos	------------	(2)	Iron and steel:		
Barite	------------	(2)	Pig iron and ferro-alloys	*30, 000	*32, 000
Cement, hydraulic	*1, 000, 000	*950, 000	Steel ingots and castings	80, 000	*120, 000
Gypsum	*165, 000	*80, 000	Salt	112, 218	(2)

[1] Coal is produced, but data are not available. See also p. 1603.
[2] Data not available.

TURKEY (IN EUROPE)

Data on output of Turkey in Europe are included with those of Turkey in Asia.

U. S. S. R. (IN EUROPE AND ASIA)

TABLE 48.—Mineral production, 1948–49, in metric tons (all data estimated)

Mineral [1]	1948	1949	Mineral [1]	1948	1949
Aluminum, smelter	140, 000	(2)	Lead, smelter	75, 000	90, 000
Bauxite	500, 000	(2)	Magnesium metal	5, 000	5, 000
Chromite	600, 000	350, 000	Nickel	25, 000	25, 000
Coal (thousand tons)	201, 000	226, 000	Petroleum, crude (thousand barrels)	225, 000	240, 000
Coke	20, 000, 000	24, 000, 000	Platinum (troy ounces)	125, 000	100, 000
Copper, smelter	180, 000	200, 000	Salt	(3)	(3)
Gold (troy ounces)	7, 000, 000	7, 000, 000	Tungsten concentrates, 60 percent WO_3 basis	1, 500	1, 500
Iron and steel:			Zinc, smelter	110, 000	110, 000
Pig iron and ferro-alloys	12, 770, 000	15, 000, 000			
Steel ingots and castings	18, 300, 000	21, 600, 000			

[1] Antimony, arsenic, asbestos, barite, beryl, bismuth, cadmium, cement, copper, corundum, diamonds, feldspar, fluorspar, fuel briquets, graphite, gypsum, iron ore, lead, magnesite, manganese ore, mercury, mica, molybdenum, peat, phosphate rock, potassium salts, pyrites, pyrophyllite, silver, native sulfur, talc, and zinc are produced, but data are not available. See also p. 1603.
[2] Data not available.
[3] Exceeds 4,000,000 tons annually.

UNITED KINGDOM

TABLE 49.—Mineral production, 1948–49, in metric tons

Mineral [1]	1948	1949	Mineral [1]	1948	1949
Aluminum, smelter	30, 510	30, 832	Lead:		
Bauxite	------------	(2)	Mine	2, 312	2, 122
Cadmium, smelter (kilograms)	115, 769	102, 662	Smelter	*2, 312	*2, 122
Cement, hydraulic	8, 657, 762	9, 364, 000	Magnesium metal [5]	3, 500	5, 100
Coal:			Manganese ore	------------	(2)
Great Britain (thousand tons)	211, 772	217, 161	Nitrogen, fertilizer [6]	258, 000	289, 800
Northern Ireland:			Petroleum, crude (thousand barrels)	323	338
Bituminous (thousand tons)	1.	(2)	Salt	13, 245	(2)
Lignite (thousand tons)	(3)	(2)	Silver (troy ounces)	25, 000	(2)
Coke	15, 584, 175	15, 739, 630	Talc and soapstone	(2)	2, 621
Fluorspar	71, 124	(2)	Tin:		
Fuel briquets	1, 475, 305	1, 536, 268	Mine (long tons)	1, 281	1, 217
Gypsum	1, 175, 570	(2)	Smelter (long tons) [7]	31, 602	28, 384
Iron ore [4]	13, 299, 282	13, 620, 000	Tungsten concentrates, 60 percent WO_3 basis	*70	30
Iron and steel:			Zinc, smelter	73, 138	65, 124
Pig iron and ferro-alloys	9, 425, 286	9, 652, 881			
Steel ingots and castings	15, 115, 369	15, 801, 600			

[1] Arsenic, barite, bismuth, chromite, feldspar, and pyrites are produced, but data are not available. See also p. 1603.
[2] Data not available.
[3] Less than 1,000 tons.
[4] Exclusive of bog ore, used mainly for gas purification.
[5] Includes secondary metal.
[6] Fiscal year ended June 30 of year stated.
[7] Includes production from imported scrap.

YUGOSLAVIA

TABLE 50.—Mineral production, 1948–49, in metric tons

Mineral [1]	1948	1949	Mineral [1]	1948	1949
Aluminum, smelter	2,900	(2)	Iron and steel:		
Bauxite	*190,000	(2)	Pig iron and ferro-alloys	172,000	*225,000
Cement, hydraulic	1,188,000	(2)	Steel ingots and castings	*368,000	*390,000
Coal (thousand tons)	11,500	*12,900	Lead	41,700	36,300
Copper, smelter	*52,500	*34,000	Petroleum, crude (thousand barrels)	385	440

[1] Antimony, barite, bismuth, chromite, copper (mine), fuel briquets, gold, gypsum, iron ore, lead (smelter), magnesite, manganese ore, mercury, molybdenum, pyrites, salt, silver, and zinc are produced, but data are not available. See also p. 1603.

Gypsum	1,016	181	Talc and soapstone	322	590
Magnesite	(2)	20			

[1] Beryl is produced, but data are not available. See also p. 1603.
[2] Data not available.

LIBERIA

Production of gold in Liberia totaled 13,797 troy ounces in 1948 and 14,656 ounces in 1949.

LIBYA

Production of salt in Libya totaled 6,140 metric tons in 1948. Data for 1949 are not available.

MADAGASCAR

TABLE 64.—Mineral production, 1948–49, in metric tons

Mineral [1]	1948	1949	Mineral [1]	1948	1949
Asbestos	(3)	(3)	Graphite (exports)	8,438	9,767
Corundum	4	(3)	Mica	507	969
Gold (troy ounces)	2,095	1,663			

[1] Beryl, cement, coal, feldspar, salt, and talc are produced, but data are not available. See also p. 1603.
[2] Less than 1 ton.
[3] Data not available.

MALTA

Production of salt in Malta totaled 1,869 metric tons in 1948. Data for 1949 are not available.

MAURITIUS

Salt is produced in Mauritius, but data are not available.

MOZAMBIQUE

TABLE 65.—Mineral production, 1948–49, in metric tons

Mineral [1]	1948	1949	Mineral [1]	1948	1949
Bauxite	2,960	(2)	Graphite	120	(2)
Beryllium concentrates	81	(2)	Mica	1	(2)
Cement, hydraulic	35,858	(2)	Silver (troy ounces)	712	(2)
Coal (thousand tons)	16	(2)	Tin (long tons)	*1	--------
Gold (troy ounces)	5,427	(2)			

[1] Corundum and salt are produced, but data are not available. See also p. 1603.
Data not available.

NIGERIA

TABLE 66.—Mineral production, 1948–49, in metric tons

Mineral [1]	1948	1949	Mineral [1]	1948	1949
Coal (thousand tons)	618	559	Tin (long tons)	9,237	8,824
Gold (troy ounces)	2,899	2,515	Tungsten concentrates, 60 percent WO_3 basis	4	5
Lead	--------	(2)			
Silver (troy ounces)	4,270	484			

[1] Salt is produced, but data are not available. See also p. 1603.
[2] Data not available.

NORTHERN RHODESIA

TABLE 67.—Mineral production, 1948–49, in metric tons

Mineral [1]	1948	1949	Mineral [1]	1948	1949
Cobalt [2]	367	402	Mica	--------	3
Copper:			Silver (troy ounces)[4]	145,865	134,920
Mine	226,472	259,084	Tin (long tons)	--------	7
Smelter	217,044	263,491	Vanadium	173	153
Gold (troy ounces)[3]	1,180	1,186	Zinc, smelter	22,526	23,217
Iron ore	149	1,749			
Lead:					
Mine	11,700	14,169			
Smelter	13,229	14,189			

[1] Manganese ore is produced, but data are not available. See also p. 1603.
[2] Fiscal year ended June 30 of year stated.
[3] Included is yield from Nkana-mine refinery slimes accumulated during the war: 999 ounces in 1948 and 972 ounces in 1949.
[4] Recovered from an accumulation of refinery slimes.

NYASALAND

Nyasaland may have produced graphite in 1948–49 and corundum in 1949, but data are not available. No corundum was produced in 1948.

SEYCHELLES ISLANDS

Exports of phosphate rock (guano) from the Seychelles Islands totaled 21,924 metric tons in 1948 and 14,243 tons in 1949.

SIERRA LEONE

TABLE 68.—Mineral production, 1948–49, in metric tons

Mineral [1]	1948	1949	Mineral [1]	1948	1949
Chromite	7,886	(2)	Iron ore	967,888	(2)
Diamonds (metric carats)	465,518	494,119	Platinum (troy ounces)	109	(2)
Gold (troy ounces)	2,193	2,160			

[1] Silver is produced, but data are not available. See also p. 1603.
[2] Data not available.

SOUTHERN RHODESIA

Diamonds:		
Lode (metric carats)	*930,000	964,266
Alluvial [5] (metric carats)	*270,000	289,756
Feldspar	2,101	3,259
Fluorspar	3,754	5,107
Gold (troy ounces)	11,584,849	11,705,048
Graphite	172	[3] 83
Gypsum (sales)	78,625	88,232
Iron ore	1,163,723	1,248,000
Iron and steel:		
Pig iron and ferro-alloys	651,100	708,400
Steel ingots and castings	596,983	631,516
Lead	----------	(2)
Magnesite	10,660	10,487
Manganese ore	276,393	655,181
Mica	1,362	1,066
Nickel	458	618
Phosphate rock	39,656	56,471
Platinum-group metals (troy ounces):		
Platinum-group metals from platinum ores	68,926	87,300
Osmiridium from gold ores	5,520	6,031
Pyrites, including cupreous pyrites	35,992	35,527
Silver (troy ounces)	1,170,951	1,159,375
Talc, pyrophyllite and soapstone	4,897	5,061
Tin:		
Mine (long tons)	457	471
Smelter (long tons)	554	595
Tungsten concentrates, 60 percent WO_3 basis	151	416

[1] Coke and salt are produced, but data are not available. See also p. 1603.
[2] Data not available.
[3] January to September, inclusive.
[4] Local sales and exports.
[5] Includes an estimate of 100,000 carats for State Mines of Namaqualand.

ASIA

ADEN

Production of salt in Aden totaled 275,408 metric tons in 1948 and 308,302 tons in 1949.

AFGHANISTAN

Coal and salt are produced in Afghanistan, but data are not available. Planned output of coal in 1948 was 15,000 metric tons.

BAHREIN ISLAND

Bahrein Island produced 10,915,000 barrels of crude petroleum in 1948 and 10,985,000 barrels in 1949.

BRITISH BORNEO

TABLE 77.—Mineral production, 1948–49, in metric tons

Mineral [1]	1948	1949
Gold (troy ounces) [2]	599	(3)
Petroleum, crude (thousand barrels)	20,120	25,108
Phosphate rock	427	508

[1] Coal and silver are produced, but data are not available. See also p. 1603.
[2] Sarawak only.
[3] Data not available.

BURMA

Fluorspar	68	960	Mine (long tons)	118	189
Fuel briquets	577,501	355,366	Smelter (long tons)	145	479
Gold (troy ounces)	69,180	84,532	Tungsten concentrates, 60 percent WO_3 basis	9	20
Graphite	9,137	5,299	Zinc:		
Gypsum	113,754	117,123	Mine	30,070	39,880
Iron ore [5]	561,063	779,674	Smelter	21,200	32,318

[1] Potassium salts are produced, but data are not available. See also p. 1603.
[2] Data not available.
[3] Less than 1 ton.
[4] In addition, the following tonnages of aplite and other feldspatic rock were produced: 1948—35,840; 1949—50,943.
[5] Includes iron-sand production as follows: 1948—2,588 tons; 1949—23,724 tons.
[6] Fiscal year ended June 30 of year stated.

KOREA (SOUTH)

TABLE 90.—Mineral production, 1948–49, in metric tons

Mineral [1]	1948	1949	Mineral [1]	1948	1949
Aluminum, smelter	*[2] 1,300	(3)	Gold (troy ounces)	3,466	3,419
Barite	--------	(3)	Graphite	15,454	40,671
Bismuth (kilograms)	104,000	173,420	Lead	300	80
Cement	17,350	24,132	Magnesium metal	--------	(3)
Coal:			Molybdenum	2	11
Bituminous and anthracite (thousand tons)	799	1,066	Nitrogen, fertilizer [4]	10,000	20,000
Lignite (thousand tons)	68	60	Salt	89,979	188,812
Coke	10,971	4,004	Silver (troy ounces)	38,506	18,962
Copper:			Talc, pyrophyllite, and soapstone	72	2,773
Mine	66	28	Tungsten concentrates, 60 percent WO_3 basis	*[2] 2,245	*[2] 2,448
Smelter	514	808	Zinc	180	(3)
Fluorspar	--------	1,230			
Fuel briquets	76,724	168,358			

[1] Arsenic, lead (smelter), manganese ore, phosphate rock, and steel are produced but data are not available. See also p. 1603.
[2] Including North Korea.
[3] Data not available.
[4] Fiscal year ended June 30 of year stated. Data cover North Korea only.

KUWAIT

Production of crude petroleum in Kuwait totaled 46,500,000 barrels in 1948 and 90,000,000 barrels in 1949.

MALAYA

TABLE 91.—Mineral production, 1948–49, in metric tons

Mineral [1]	1948	1949	Mineral [1]	1948	1949
Coal (thousand tons)	381	393	Titanium concentrates: Ilmenite	12,909	20,03
Gold (troy ounces)	10,212	13,617	Tungsten concentrates, 60 percent WO_3 basis	87	6
Iron ore	651	8,525			
Tin:					
Mine (long tons)	44,815	54,910			
Smelter (long tons)	49,707	62,737			

[1] Graphite and silver are produced, but data are not available. See also p. 1603.

PAKISTAN

TABLE 92.—Mineral production, 1948–49, in metric tons

Mineral [1]	1948	1949	Mineral [1]	1948	1949
Antimony		(2)	Gypsum	(2)	*16,25
Cement, hydraulic	327,168	(2)	Petroleum, crude (thousand barrels)	490	74
Chromite	17,707	*15,000	Salt [3]	156,378	223,50
Coal (thousand tons)	250	*325			
Fuel briquets	4,596	(2)			

[1] Talc is produced, but data are not available. See also p. 1603.
[2] Data not available.
[3] Punjab only.

PHILIPPINES

TABLE 93.—Mineral production, 1948–49, in metric tons

Mineral [1]	1948	1949	Mineral [1]	1948	1949
Cement, hydraulic	120,384	206,202	Gypsum	818	2,71
Chromite	256,854	246,744	Iron ore	18,289	370,17
Coal (thousand tons)	88	123	Manganese ore	25,565	26,28
Copper	3,350	7,007	Silver (troy ounces)	150,760	218,41
Gold (troy ounces)	209,225	287,844			

[1] Pig iron, phosphate rock, and salt are produced, but data are not available. See also p. 1603.

PORTUGUESE INDIA

TABLE 94.—Mineral production, 1948–49, in metric tons

Mineral	1948	1949
Iron ore	(1)	151,00
Manganese ore (exports)	4,728	(1)
Salt (exports)	10,719	(1)

[1] Data not available.

QATAR

Production of crude petroleum in Qatar totaled 750,000 barrels in 1949. None was produced in 1948.

SAUDI ARABIA

TABLE 95.—Mineral production, 1948–49

Mineral [1]	1948	1949
Gold (troy ounces)	74,000	67,200
Petroleum, crude (thousand barrels)	142,853	174,008

[1] Silver is produced, but data are not available. See also p. 1603.

SYRIA AND LEBANON

TABLE 96.—Mineral production, 1948–49, in metric tons

Mineral	1948	1949	Mineral	1948	1949
Cement, hydraulic	258,052	284,632	Gypsum	*1,000	1,400
Coal: Lignite	(1)	(2)	Salt [3]	*30,000	(2)

[1] Less than 1,000 tons.
[2] Data not available.
[3] Syria only. Salt is also produced in Lebanon, but data are not available. See also p. 1603.

THAILAND

TABLE 97.—Mineral production, 1948–49, in metric tons

Mineral [1]	1948	1949	Mineral [1]	1948	1949
Antimony	85	213	Tin (long tons)	4,240	7,815
Cement, hydraulic	82,800	127,200	Tungsten concentrates, 60 percent WO_3 basis	495	742
Gypsum	200	154			

[1] Salt is produced, but data are not available. See also p. 1603.

TURKEY (IN ASIA AND EUROPE)

TABLE 98.—Mineral production, 1948–49, in metric tons

Mineral [1]	1948	1949	Mineral [1]	1948	1949
Antimony	520	420	Iron ore	185,434	216,043
Asbestos	203	170	Iron and steel:		
Cement, hydraulic	344,924	372,584	Pig iron and ferro-alloys	166,467	112,760
Chromite	285,353	434,117	Steel ingots and castings	98,000	*118,000
Coal:			Lead		168
Bituminous (thousand tons)	2,669	2,705	Magnesite	3,407	4,870
Lignite (thousand tons)	829	*927	Manganese ore	8,227	16,702
Coke	337,471	234,500	Petroleum, crude (thousand barrels)		95
Copper:			Pyrites, including cupreous pyrites	(2)	
Mine	12,367	13,130	Salt	*236,905	*263,000
Smelter	10,979	11,283	Sulfur, native (long tons)	2,369	2,995
Fuel briquets	7,426	40,102			

[1] Arsenic and silver are produced, but data are not available. See also p. 1603.
[2] Data not available.

U. S. S. R. (IN ASIA)

Data on output of U. S. S. R. in Asia are included with those of U. S. S. R. in Europe.

OCEANIA

AUSTRALIA

TABLE 99.—Mineral production, 1948–49, in metric tons

Mineral [1]	1948	1949
Antimony	170	[2] 40
Arsenic, white, smelter	520	[3] 69
Asbestos	1,348	[4] 446
Barite	3,831	([5])
Bauxite	5,736	[2] 4,093
Beryllium concentrates	56	21
Bismuth (kilograms) [6]	*4,000	([5])
Cadmium, smelter (kilograms)	293,638	[7] 157,488
Cement, hydraulic [8]	643,097	1,076,302
Chromite	----------	([5])
Coal:		
Bituminous (thousand tons)	15,019	[4] 13,516
Lignite (thousand tons)	6,800	[4] 5,713
Cobalt	15	([5])
Copper:		
Mine	12,567	12,500
Smelter	11,572	10,192
Feldspar [9]	9,767	3,538
Fluorspar	520	568
Gold (troy ounces)	890,805	896,872
Graphite	234	[4] 52
Gypsum	280,853	[4] 207,874
Iron ore	2,076,979	[2] 772,194
Iron and steel:		
Pig iron and ferro-alloys [10]	1,255,405	1,058,000
Steel ingots and castings [10]	1,176,439	1,188,000
Lead:		
Mine	207,776	203,445
Smelter	162,057	185,300
Magnesite	32,962	[4] 2,641
Manganese ore	3,502	([5])
Mica	427	733
Molybdenum	2	3
Petroleum, crude (thousand barrels)	----------	1
Phosphate rock	2,170	([5])
Platinum-group metals: Osmiridium (troy ounces)	92	([5])
Potassium salts:		
Alunite (equivalent K_2O)	53	([5])
Alunitic mud (equivalent K_2O)	652	[7] 400
Pyrites, including cupreous pyrites	90,848	[4] 57,726
Salt	264,173	[4] 84,615
Silver (troy ounces)	10,057,519	9,849,213
Talc and soapstone	6,186	([5])
Tin:		
Mine (long tons)	1,874	1,973
Smelter (long tons)	1,885	1,955
Titanium concentrates:		
Ilmenite [11]	11,807	[4] 7,351
Rutile [11]	13,521	[4] 8,949
Tungsten concentrates, 60 percent WO_3 basis	1,234	*1,388
Zinc:		
Mine	151,681	153,000
Smelter	82,617	82,255

[1] Coke, fuel briquets, diamonds, and peat are produced, but data are not available. See also p. 1603.
[2] Excluding New South Wales.
[3] January to June, inclusive.
[4] Incomplete data.
[5] Data not available.
[6] Partly estimated; excludes content of some bismuth-tungsten concentrates.
[7] January to September, inclusive.
[8] Excluding Queensland, South Australia, and Tasmania.
[9] Includes some china stone.
[10] Data for fiscal year ended June 30 of year stated.
[11] Excludes content of beach sand in stock dumps.

FIJI ISLANDS

TABLE 100.—Mineral production, 1948–49

Mineral	1948	1949
Gold (troy ounces)	93,059	104,036
Silver (troy ounces)	29,187	29,755

FRENCH OCEANIA

Exports of phosphate rock from French Oceania (Makatéa Island, Tuamotu Archipelago) totaled 183,104 metric tons in 1948 and 239,532 tons in 1949.

NAURU AND OCEAN ISLANDS

Exports of phosphate rock from Nauru Island were 544,298 metric tons in 1948 and 802,070 tons in 1949. Exports of phosphate rock from Ocean Island were 126,854 metric tons in 1948 and 265,087 tons in 1949.

NEW CALEDONIA

TABLE 101.—Mineral production, 1948–49, in metric tons

Mineral [1]	1948	1949	Mineral [1]	1948	1949
Chromite	75,021	*75,000	Gypsum	779	17,119
Coke	--------	(2)	Nickel	4,882	3,371

[1] Iron ore and phosphate rock are produced, but data are not available. See also p. 1603.
[2] Data are not available.

NEW GUINEA TERRITORY [3]

TABLE 102.—Mineral production, 1948–49

Mineral	1948	1949
Gold (troy ounces)	86,556	95,100
Silver (troy ounces) [1]	31,739	(2)

[1] Fiscal year ended May 31 of year following that stated.
[2] Data not available.

NEW ZEALAND

TABLE 103.—Mineral production, 1948–49, in metric tons

Mineral [1]	1948	1949	Mineral [1]	1948	1949
Antimony	4	(2)	Magnesite	549	(2)
Arsenic, white, smelter	8	(2)	Manganese ore	533	(2)
Asbestos	--------	(2)	Mercury (flasks)	--------	(2)
Cement, hydraulic	247,205	254,039	Petroleum, crude (thousand barrels)	2	7
Coal:			Phosphate rock	--------	(2)
Bituminous and anthracite (thousand tons)	968	937	Platinum (troy ounces)	--------	(2)
Lignite (thousand tons)	1,853	1,874	Silver (troy ounces)	232,563	232,500
Fuel briquets	13,113	(2)	Talc and soapstone	--------	(2)
Gold (troy ounces)	93,903	84,856	Tungsten concentrates, 60 percent WO_3 basis	28	28
Iron ore	4,853	(2)			

[1] Coke, pig iron, and mica are produced, but data are not available. See also p. 1603.
[2] Data not available.

PALAU ISLANDS

Exports of phosphate rock from Angaur Island were 68,493 metric tons in 1948 and 140,221 tons in 1949. The destination was Japan. Peak exports of bauxite from Babelthuap Island were 135,669 metric tons in the year ended March 31, 1943, but there was no output in 1946–49.

PAPUA

Papua may have produced gold and manganese ore in 1948–49 and platinum in 1949, but data are not available. No platinum was produced in 1948.

[3] Western New Guinea is part of Indonesia, and southeastern New Guinea is Papua.
